The directors of the Great Western Railway Company propose to create a deep-water port at Brean, a little to the south of Weston-super-Mare, for the Canadian traffic. Brean lies below a headland jutting out into deep water, and has the advantage of being only 140 miles west of London, while the sea distance to America is 250 miles less than to Southampton. It is reported that the Great Western Railway, being disappointed of the possibility of the New York steamers calling at Milford Haven, are prepared to spend millions on constructing docks and piers at Brean to secure the business of a weekly line of fast mail steamers to the Canadas.

Now that tenders have been invited for the construction of the extension of the Manchester, Sheffield, and Lincolnshire Railway to London, we may soon expect to see extensive clearances in the St. John's Wood district. The line, of which Sir Douglas Fox is engineer-in-chief, and which is 112 miles in length, is divided into seven contracts, and the total estimated cost is 6½ millions sterling. The railway starts at Annesley by a junction with the Manchester and Sheffield line to the latter town, and passes through Nottingham, Leicester, Loughborough, Lutterworth, Rugby, and Daventry, to Quainton-road, 21 miles north of London. The works are heavy in some parts, Nottingham being tunnelled through; but for this 91 miles of the line there are no great difficulties, and the cost of construction is put at 3·6 millions, or about £37,000 per mile. The quantity of steel work required is put at 4,000 tons. At Quainton-road the new line will join the Aylesbury and Buckingham extension of the Metropolitan Railway now in progress, and will finally terminate at a large passenger station, with hotel, in Edgware-road and Marylebone-road, the station covering an area of 58 acres. The part within the Metropolis will be mostly in tunnel, there being four single-arched tunnels, and partly in cut and cover, and very costly, the 4½ miles being calculated at £542,152 per mile. From this terminal station a branch line will be carried through to Baker-street. The quantity of land acquired in connection with the scheme is 1,475½ acres, of which 73½ acres are in London. This brings the total cost of the line to 6½ millions sterling. The railway passes through a populous district, the total population, excluding London, being 7½ millions. The Great Northern have running powers over some part of the line, while the new railway will have corresponding privileges in respect of the Great Northern system. As to Lord's cricket ground, the company purchase the Clergy Orphanage for the enlargement of the ground, while the contention of congested traffic in the vicinity of the new terminal station was met by a grant of money to the London County Council for street widening.

Those who propose to provide accommodation for infectious diseases for a district have an unthankful task before them. In the abstract we all agree that provision ought to be made for the isolation of fever cases, but we have the strongest possible objection to making such provision close to our our dwelling places. As soon as a site is suggested the landowners and local residents are up in arms to resent the intention of such an objectionable institution, and it is loudly asserted if the adjacent land is open that it is shameful to spoil so beautiful a district, or if built upon that such hospitals ought never to be erected in densely populated areas. We have heard vigorous shrieks of protest and disapprobation from Tooting, Hither-Green, and Tottenham of late, and now the ratepayers of South Hornsey have their turn at harrying their neighbours in persecuted Tottenham. When Mr. T. W. Thompson, of the Medical Department of the Local Government Board, held an inquiry on Monday into an application for the Department's sanction to the borrowing of £2,050 for the purchase of about three-quarters of an acre of land in St. Ann's-road, Tottenham, for the erection by the South Hornsey Local Board of an isolation hospital for infectious diseases other than small-pox, opposition was strenuously made on behalf of the inhabitants of Tottenham and South Hornsey. In support of the proposal Mr. Kurley said that the district of South Hornsey was at present without any accommodation for isolating infectious cases. The Local Government Board had insisted that some accommodation should be provided, and the South Hornsey Local Board had been fortunate in securing the privilege of buying a piece of land immediately adjoining the hospital of the Metropolitan Asylums Board at Tottenham. The chairman of the South Hornsey Local Board; Dr. T. S. H. Jackman, medical officer of the district, and Mr. M. H. Jameson, the surveyor, gave evidence in support of the proposed new hospital. It transpired that land for such a purpose in the Local Board's own district would cost £11,000 an acre. If the proposed hospital was erected accommodation would be provided for twelve beds, and all the buildings, except the "administrative cottage," would be 40ft. from any other building. On the other hand, the proposal was denounced as an unwarrantable invasion on the part of South Hornsey. Tottenham had already, at very great expense, provided for its own infectious and small-pox cases, and the district, already saddled with the great hospital of the Metropolitan Asylums Board, objected to having another similar institution planted in what in years to come would be its most populous part. Evidence was given to show that much cheaper land could be obtained elsewhere. The decision of the Local Government Board will be impatiently awaited by residents in the districts concerned; but if such pestiferous buildings must be provided, and I fear they must, common sense suggests that the least objectionable site would be found, as proposed in this case, cheek by jowl with existing institutions of the class.

The executive council of the London Building Trades Federation have advised its members, in the interests of the union, to take an active part in the forthcoming London School Board elections. They have decided to submit certain test questions on the points of fair wages and sub-contracting to every candidate who presents himself for election. The test questions are: (1) Whether the candidate is in favour of contractors supplying with each tender a schedule of wages paid to employés, and where the wages is found less than the trade union rates, that the tender be not entertained; (2) whether he is opposed to a contractor sub-contracting any portion of his contract; (3) whether he is opposed to sub-contracting without the direct sanction of the Board; (4) whether he is in favour of the enforcement of a penalty for the evasion of the Board's terms of contract; (5) does he approve of the Board doing the work direct without the intervention of a contractor; and (6) if he is in favour of practical mechanics only being appointed by the Board as clerks of works? Prior to the elections the Federation intends to issue a manifesto based upon the answers, and recommending to members and others such candidates as they deem worthy of support.

The Public Works Department of India are often taunted for their architectural designs. Our contemporary, *Indian Engineering,* not without reason, observes it is a somewhat undeserved taunt, for it points out that even in London nearly all structures designed by engineers unaided by architects are faulty from an æsthetic point of view. We agree with our contemporary in thinking better results might be attained if a more generous recognition was made of the work of Indian architects, and that Government might develop an architects' department in each province with advantage. It is not economy altogether that has spoiled the buildings, but the handing over of the design to incompetent assistants. The Tower Bridge would be infinitely worse than it is if this system of delegation of the architectural details to subordinates had been followed.

Purists are horrified at the touching-up of Decimus Burton's masterpiece, the Athenæum. The R.A.'s, who are big men even in the Academy, and are said to be members of the Athenæum Committee, have caused the delicate piece of Greek design to be painted. The stone, without including the statue of Minerva over the colonnade, they have covered with white, the handsome rooms they have treated to what one æsthetic sufferer describes as "odious stomach-turning combinations." The Classic hall is a dull yellow, the statue of Apollo gilded from crown to toes, the staircase walls sienna above, mottled brown lower, "greenery-yallery" at the bottom. In the reading-room the ceiling has turned blue with streaks of gold, while Japanese gold paper pales in contrast with the real gilding. In the dining-room, pale violet is set off with yellow. But the library gives the critics most pain, with its combinations of silver and blue, silver and canary, salmon and Scagliola yellow. The reply, of course, is that the Greeks used colour freely on their public monuments, and that the choice of tints is a matter of taste.

The façade of the Brompton Oratory is now completed all but a few finishing touches. It is in the style of the Italian Renaissance. The work is another example of the method of building great edifices by "instalments." It is several years since the "shell," as one might call it, of the Oratory was reared. Since then, year by year, the decoration of the interior has proceedsd by stages, and in the costliest style, until the artistic beauty of most of the Continental churches has been outrivalled. The Oratory has in consequence been more and more taking a prominent place as one of the great show places of the Metropolis. Unfortunately, the façade having been left to the last, and nothing but an ordinary brick front having, till lately, met the eye of the pedestrian, no one, unless specially informed, would have had his attention arrested by the place. This has caused many a visitor to South Kensington to miss the artistic pleasure of viewing Mr. Gribble's beautiful interior. One knows not, of course, what Mr. Bentley is going to do presently at Westminster; but, so far, the architect of the Brompton Oratory has written his name highest on the roll of the builders of churches for the old faith since it was driven from the abbeys and minsters of England.

The members of the Edinburgh branch of the Scottish National Federation of House and Ship Painters, along with friends, held their fifth anniversary social meeting in the Oddfellows' Hall in that city, on Friday night. In an opening address, Mr. George Greenhill, the president of the branch, drew attention to the aims and objects of the parent body, which, he said, had now a strength of about 2,000 members, the largest branch being in Glasgow. In regard to the local branch, he emphasised the importance of the technical classes as conducted at the Heriot-Watt College. The classes were largely taken advantage of, something like a hundred pupils having attended. A musical programme was then carried through.

Building Intelligence.

Berwick, Salop.—The chapel in the grounds of Berwick Park, rebuilt and consecrated in 1680, was reopened on Tuesday week, after undergoing a restoration embracing not only the renovation of the fabric, some portions of which date back probably to the 13th century, but also the addition of a new chancel and other adjuncts. Until recently the building consisted of a nave, tower (built in 1672), and porch. The additions include a new chancel, south chancel aisle, organ-chamber, clergy and choir vestries, and north and south porches. The buildings are of Grinshill stone, and the style adopted is 17th-century Renaissance. The chancel is divided from the nave by a semicircular arch, built to the full height of the nave. The roof is of semicircular vaults, panelled with moulded ribs. The east window has been filled with stained glass by Comere and Capronnier Frères, of Brussels, the subject being Christ Blessing Little Children. The other windows are in geometrical patterns by Messrs. Camm Bros., of Smethwick. The chancel is paved with encaustic tiles from Messrs. Godwin's Lugwardine Tileries, Hereford. The south chancel aisle contains oak seats for the inmates of the almshouses, and in the organ-chamber there has been erected a new instrument, with two manuals, by Messrs. Walker and Sons, of Francis-street, Tottenham Court-road. The whole of the walls of the nave and chancel have been panelled in oak, with carved cornices, the east end having emblematical carvings, by Mr. T. Catley, of Kennington, S.E. A stone font has been provided, and oak choir seats, prayer desk, and eagle lectern have been made by Messrs. Jones and Willis, from designs by the architect. The church is heated by hot-water apparatus, which, with the gas-fittings and ironwork, was supplied by Messrs. Lee, Sons, and Co., of Shrewsbury. The works have been carried out from the designs and under the superintendence of Mr. F. B. Osborn, of Birmingham; the contractors being Messrs. Bowdler and Co., of St. Julian's Friars, Shrewsbury. Mr. James Thorneloe was clerk of the works.

Bristol Cathedral.—Some interesting discoveries have been made in the choir of Bristol Cathedral, now undergoing restoration. A trench has been dug in the centre of the choir west to east, from the second to the fourth bay from the screen, with the object of unearthing portions of the Norman church. A foundation was discovered which is believed to have carried the east wall of the earlier and smaller edifice, the position of the foundation, which apparently extends across the choir, being exactly in the centre of the third bay. It is generally thought that this is part of the Norman church; but opinions are divided as to the date and object of the foundation some twelve paces further east, which some think supported the reredos or screen which divided the Lady-chapel from the choir. The modern and very unsatisfactory stone screen has been happily taken down, as well as the hideous and cumbersome carved freestone bases of the gas standards in the choir. Thirty years ago or so the old stone screen was removed. More or less beautifully carved, the remains were removed to the Cathedral close. They have now been gathered together with a view to their re-erection. The cloisters are to be restored, several munificent offers having been made for various sections of the work. When the marble flooring is laid, the stalls will be re-erected. In the mean time the groined roof is being scraped and cleaned. Mr. J. L. Pearson is the architect.—Tynedale Chapel, White Ladies-road, was reopened on Sunday after having undergone extensive alterations, the chief feature in which was the raising of the height of the tower from 37ft., as originally left, to 100ft. above the street pavement. Its style is 13th-century Gothic, somewhat French in character. It is a solid, square structure to the height of 80ft., and is surmounted by pinnacles 20ft. high. The tower is finished with an open parapet with foliated arches, and the pinnacles have carved crockets. The belfry windows are in pairs on each face of the tower, and are two-light windows with traceried heads. The structure is built of Pennant stone, with dressings of Box Ground stone. The carving has been done by Messrs. Davey and Bushell. The builder is Mr. E. Walters, of Montpelier. The clock for the tower has been supplied by Messrs. J. B. Joyce and Company, of Whitchurch, Salop. It will have two faces, and will be provided with Cambridge chimes, which will strike the quarters; the hours will be struck on a 10cwt. bell. Another improvement is the Wathen memorial pulpit. It is executed in Caen stone, the style being the early 13th century. It is supported upon a central pedestal, with isolated columns around it. The pulpit was executed by Messrs. R. Wilkins and Sons, of Surrey-street, the carving being intrusted to Messrs. Davey and Bushell. The architects of all the work were Messrs. Henry Crisp and Oatley, of Clare-street, Bristol.

Burslem Park.—On Thursday last this park was opened by the mayor, Alderman Lawton, amid general rejoicings, the town being *en fête* for the day. This park, which has been designed by T. H. Mawson, garden architect, of Windermere and Market Drayton, has been formed out of what was practically a cinder-heap and pit-banks, over 70,000 loads of soil being required to form the beds for the various plantations and lawns. The principal feature of the park is a large terrace, surrounded by a balustraded wall, into which are worked seats and covered shelters; upon the terrace are two terracotta fountains, by Doulton, of Lambeth; a band-stand, with a curved tiled roof, occupies a large octagonal bastion to the front; and a pavilion, in rough-cast and half-timber, a corresponding position at the opposite side of the terrace. On the terrace are a series of lawns, out of which are cut geometrical beds. The whole of the entrance gates are in wrought iron, by Brown and Co., of Birmingham. The superintendent's lodge, which occupies a position at the entrance nearest the town, is in rough-cast and half-timber, with tiled roofs. A small lake occupies a position at the foot of a large pit-bank, into the face of which has been worked some effective rockwork, by Pulhams, of Broxbourne, one part of which has been formed into a cascade, which is supplied by the waste water from the fountains on the terrace, and which in turn feeds the lake, a bit of effective make-believe which is very much better than the original pit-bank. The lodge and terrace walling have been erected by Mr. Nicholas Bennett, the boundary walls by Mr. J. Windsor, the pavilion by Mr. J. Allport, and the bandstand and shelters by Mr. W. Cooke, all of whom are builders in the town. The land cost £5,500, and the laying out involved an outlay of another £10,000. Mr. Mawson is the garden architect for the Cauldon-gardens, Hanley, opened in July last; and for the Bellevue Park, Newport, Mon., which is to be opened on Saturday, Sept. 8.

Felixstowe.—Sir Arthur Blomfield, A.R.A., is the architect of a new church, for which Messrs. Dorey and Co. are the builders, at Felixstowe. The site is on the cliff, and the tower will be finished with a spire as a landmark for seamen. Accommodation is to be provided for six to seven hundred sittings. Captain Pretyman, of Orwell Park, is providing a part of the necessary funds

Kirkstall Abbey.—The chairman and the members of the sub-committee of the Leeds City Council having charge of Kirkstall Abbey, visited the abbey on Monday, being met in the grounds by Mr. J. T. Micklethwaite, R.A., of Westminster, the architect under whose supervision the works necessary for the preservation of the ruins are being carried out. The committee inspected the large tower, which is about to be repointed, and Mr. Micklethwaite was instructed to prepare plans for a new lodge and entrance gates. Up to the present time £5,500 has been expended on works in connection with the abbey and recreation ground, but that sum includes more than £1,000 for adjoining land which was added to the recreation ground. Mr. Micklethwaite informed the committee that the whole of the works would be completed within the next twelve months.

Leeds.—The new central stores of the Leeds Industrial Co-operative Society, in Albion-street, were opened on Saturday. The premises face others on the opposite side of the street, built from Mr. J. W. Comyn's design in 1883, and have been erected from plans by Mr. W. S. Braithwaite, of South-parade, Leeds. They cover an area of 1,000 yards, extending back to Upper Mill-street. The ground floor and basement are arranged as a furnishing department. The first floor drapery and millinery department. The second floor is to be devoted to workrooms for dress and mantle making. The third floor is the tailors' workroom. The building is lighted throughout by electricity. The elevation to Albion-street is of stone from the Halifax district, that to Upper Mill-hill of pressed brick, and the rest of glazed brick. The floors are supported by iron columns, with English steel and iron beams and girders. The flooring is of wood blocks, and the ceilings are panelled in concrete. The total cost will be about £17,000. The several contractors were: Mr. C. Myers, stone and brickwork; Messrs. Bagshaw and Sons (Batley), iron roofs, girders, and columns; Messrs. A. and J. Wheater, concrete fireproof flooring; Mr. Thos. Moore, plasterer's work; Messrs. Watson and Worsnop, slaters; the society's own workmen, who, under the direction of Mr. Philemon Rump, the clerk of works, have done the carpenter's and joiners' work, and the plumbing, painting, and glazing. The building was illustrated in perspective in the Building News for March 25, 1892.

Small Heath, Birmingham.—The new church of St. Aidan, Herbert-road, Small Heath, was opened on Sunday. The portion erected consists of a chancel and two bays of the nave, with north and south aisles. Three more bays and a corresponding extension of the aisles, with a west porch and baptistery, are required for the completion of the church. The exterior of building is comparatively plain. The height of the chancel to the springing of the open-timber roof is 44ft., and the total height to apex of roof is 56ft. The chancel is 45ft. long and 23ft. wide. The nave is 2ft. wider, the junction being marked by a lofty arch. The total width of nave and aisles is 55ft. To the south of the chancel is a morning chapel, and the north chancel aisle is used for the organ. East of the chapel is a sacristry, or priest's vestry, which is semi-octagonal towards the road. An ambulatory connects the latter with the north aisle and clergy house. The style of the building is Perpendicular, and the wide elliptical hollows and wave mouldings characteristic of that period are adopted. The moulded columns carry a range of lofty, traceried, clerestory windows, two to each bay, which light the whole of the church, the aisle walls being solid to exclude noise from the adjacent courts. Between each window a clustered vaulting-shaft supports the hammer-beam of the timbered roof principals, which have arched ribs and wind-braces. The whole of the timber-work is left its natural colour. The interior of the chancel is built entirely of buff terracotta. The floor of the chancel is laid with encaustic tiles, and the nave and aisles with solid wood blocks. The architect is Mr. T. Fred Proud, and the builder Mr. E. J. Charles. The cost of the section now erected was £4,000.

CHIPS.

The Corporation of Liverpool have purchased the site of Kirkdale Gaol for the sum of £17,650, and will at once take possession. The site will be laid out as a recreation ground.

Christ Church schools, St. Alban's, are being enlarged and improved from plans by Mr. H. E. Hamsell, of that city. The work is being carried out by Messrs. J. and W. Savage, also of St. Alban's.

The will has been proved of Mr. Robert Cordy Baxter, of Hethersett, Reigate, architect; over £50,000. Mr. Baxter, who was articled to the late Ambrose Poynter, of Dover, and was long in practice in Abchurch-lane, E.C., was one of the senior members of the Royal Institute of British Architects, which he joined as an Associate in 1849, becoming a Fellow twenty years later.

The reparation of the grand old tower at St. Mary's, Brecon, which stands in the centre of the town, is now being carried out under the direction of Mr. F. R. Kempson, F.R.I.B.A., of Hereford. Nothing is being replaced except what has been demolished by time or which is found to be totally decayed or dangerous. All the framing for the bells will be new, as well as the floors. Stone has been selected which harmonises with the old work. Cement is being used throughout instead of lime mortar.

The memorial stone of a Free Methodist chapel was laid at Milton, Somerset, on Friday. The contractor is Mr. C. Taylor, of Weston-super-Mare.

A cottage hospital, which has been erected at the junction of Reid-street and Nethertown-street, Dunfermline, from plans prepared by Mr. Sydney Mitchell, architect, Edinburgh, was formally opened on Thursday in last week. The cost of the building has been about £4,500.

The new Post-office at South Brent was opened for public business on Tuesday. The building has been built by Messrs. R. Codd and Sons, from plans prepared by Mr. W. Barrons, Totnes.

Engineering Notes.

Bury, Lancs.—During the last few months a number of alterations have been carried out at the Bolton-street and Knowsley-street stations of the Lancashire and Yorkshire Railway Company. The work was undertaken by the company in response to an agitation promoted by the Bury town council, and the work at both stations is now practically completed. At the Bolton-street station the approach to the down platform has been widened from 9ft. 6in. wide to 14ft. 6in. wide, and considerably lengthened. There are now 30 steps with two intermediate landings, each 6ft. wide, the Hawksley-tread steps being divided into three sets of ten each. On this platform also a new waiting-room 32ft. by 11ft. has been erected, and two others altered. The alterations at this station have been carried out by Alderman C. Brierley, builder and contractor, Fishpool. At the Knowsley-street station a new subway has been formed, with an exit on the north side of the old entrance. In regard to the provision of waiting-rooms and other conveniences, an improvement has been effected. The works have been carried out by Mr. J. Kirkbride, builder and contractor, Fleetwood.

City of London College, Moorfields, E.C.—The syllabus of lectures in the Engineering Department of the City of London College, White-street, Moorfields, E.C., for the ensuing session, comprises every facility for the instruction of engineering students. Mr. Henry Adams, M.S.A., M.Inst.C.E., M.I.Mech.E., &c., is the professor of engineering, and has done good service in making the City of London College one of the foremost in the Metropolis for its thorough and practical teaching. The classes in technical drawing and construction have been in existence 20 years, and supply students with all that is necessary for their instruction in the principles and practice of drawing applied to construction. The architectural student cannot do better than avail himself of these classes during or before his pupilage. Construction in its various applications and branches is taught by a course of lectures; and the student has every opportunity of learning how to calculate the stresses in structures and materials. These classes are in connection with the Science and Art Department, and the fees are low enough as to enable artisans to avail themselves of the advantages of these classes. The lectures on "Strains in Ironwork," quantity surveying, and land surveying and levelling ought to be welcomed by a large class of students.

North Cornwall Railway Company.—The half-yearly report of the engineers of this company states that the portion of the third section between Delabole and Port Isaac-road Station, which has been completed, is a length of four miles and ten chains, leaving a little over six miles yet to be completed to the junction with the London and South-Western system near Wadebride. Of this remaining portion of the third section, the company are in possession of all the land required, and the works are well advanced. About 53 per cent. of the excavation has been done. There will be 22 bridges on this length, of which nine are finished, or nearly finished, and three are in hand. The key to the completion of the line is the tunnel at Trelill, the heading of which is now about two-thirds through, and about one-third of the tunnel has been finished and lined with masonry.

Southampton.—The graving dock in course of construction by the London and South-Western Railway Company in connection with the dock extension works at Southampton, is approaching completion. It will be the largest single graving dock in the world. Its length on the floor is 750ft., space being left south of the site for extension to 1,000ft. or more, if necessary. The width at the entrance is 87ft. 6in. at the sill level, and 91ft. at the cope. The depth on the blocks will be 29½ft. at high-water neap tides. The entrance will be fitted with a slip caisson, carrying the road and railway from the Empress Dock to the new quays now constructing on the Itchen. The walls are founded to a depth of 53ft., and the bottom of the invert is 59ft. below the cope level. The capacity of the dock will be 14½ million gallons, which will be emptied in from one and a-half to two hours by a pair of Gwynne's 48in. Invincible pumps, capable of delivering 112,000 gallons of water per minute. The discharge will be through two culverts of 8ft. by 6ft. 9in., all the valves and sluices being worked by hydraulic power. The greater portion of the site was reclaimed from the estuary by a chalk inclosing-bank, the area within which was drained, the trenches being then dug in which the walls were built. This bank was completed about twelve months ago, and in the interval some 136,000 cubic yards of excavation have been accomplished, and 55,000yds. of Portland cement put in. The guide stage reaching from the south-east head of the entrance to the Empress Dock is about 300ft. long, and is constructed of piles and timber framing, decked in, and is filled in up to low-water level with concrete. The quays, in all 3,830 lineal feet in extent, will also be chiefly constructed of timber and concrete. About 1,150ft. of the Test will be inclosed by a chalk bank, which is now being made. The whole of the extension works are being carried out by Messrs. Lucas and Aird, Messrs. Galbraith and Church, of Westminster, being the engineers, who are represented on the spot by Mr. Maurice F. G. Wilson, C.E., the contractors' representative being Mr. William Colson, C.E. The approximate number of men employed is 1,100.

CHIPS.

A receiving-order has been granted in the case of Charles Pinn, of Exeter, architect and surveyor.

The Roman Catholic Cathedral of St. George's, Southwark, will soon be ready for consecration. All the conditions for consecration are fulfilled, as the heavy mortgage on the cathedral was paid off some years ago, and it only remains to decorate the interior at an estimated cost of £1,500. The first stone of this fine Gothic church of Pugin's was laid in 1840, and in 1848 the opening took place.

The work of decorating the Lowmoor Wesleyan chapel, Leeds, has just been completed. The organ has also been rebuilt and enlarged by Messrs. Driver and Haigh, of Bradford, at a cost of over £200. Messrs. E. and B. Briggs carried out the decorative work.

The swing-bridge over the river Neath, which has been constructed by the Rhondda and Swansea Bay Railway Company, was completed last week. The swinging portion is 200ft. in span, and rests on a central cluster of nine steel cylinders. The total length of the bridge is 460ft., but only two spans are opening ones. It is the only swing-bridge of magnitude built on the skew, and has been constructed in two years. Messrs. Yockney and Son were the engineers, Messrs. E. Finch and Co. built the bridge, and the hydraulic machinery is by Sir W. G. Armstrong, Mitchell, and Co., of Elswick. Mr. George Palmer is the general contractor for the railway.

On Thursday in last week, a new Wesleyan church was opened at Wath. The cost was £4,500. The old chapel is to be converted into a Sunday-school.

Works of sewerage are being carried out for the local board of Ramsbottom, Lancs, the sewage being treated and disposed of at Eridge Bridge. Mr. Nuttall is the engineer.

The new branch premises for the Metropolitan Bank were formally opened on Wednesday week. The building, which is erected on the site of the old National Bank of Wales premises, has been built at a cost of about £2,200 by Mr. Edward Preece, contractor, Bridgend, from the designs of Messrs. Lambert and Rees, architects, Bridgend.

The fourth stone of a Wesleyan school was laid at Tutbury last week by Sir O. Moseley, the high sheriff of Derbyshire. Mr. A. Eaton, of Derby, is the architect, and Mr. Gould, of Tutbury, the contractor, for the school.

The licensing magistrates at Aberystwith granted on Friday licenses for an hotel and park, and cliff gardens and pavilion, to be erected by Mr. Grant, of London, at a cost of £20,000.

The memorial to Sir Jos. Whitworth, Bart., which has been erected at Darley by public subscription in the pleasure grounds opened three years since adjoining the institute that was presented to Darley Dale by the deceased, was unveiled on Saturday. Close by is the hospital presented by the legatees at a cost of £20,000. The obelisk is 39ft. high, and it stands on four base steps, two of which are 21ft. in length. The shaft is a monolith, weighing 15 tons, and is 16ft. 9in. high, standing on a plinth of solid stone of 8 tons weight. The stone came from the Darley Dale quarries. The obelisk, which was designed by Mr. C. E. Dawson, bears on one side a medallion portrait of the late Sir Joseph, on another a medallion of the great measuring machine with which his name is chiefly famous, and on the third side is an inscription. Between 6,000 and 7,000 people were present at the ceremony.

COMPETITIONS.

Exeter.—The Devon Volunteer Commemoration Committee met at Exeter on Friday, the mayor presiding, to further discuss the three selected designs. They bore the mottoes "Exon," "Jan Ridd," and "Fortiter." It had been arranged that one should be chosen for the memorial, and that standing second on the list of votes should be awarded a £5 premium. The design "Exon" was selected, and on the sealed envelope being opened it was found that the author of this was Mr. S. K. Greenslade, A.R.I.B.A., of University Hall, London. Mr. Greenslade inclosed, under cover, a tender from H. Hems and Sons, of Exeter, who undertook to carry out the work and erect the memorial to the satisfaction of the committee for the total sum of £200, including architect's charges. The committee resolved to adopt "Exon's" design subject to the city council assenting to its being placed on the Lower Terrace, outside the Assize Courts on Northernhay. The memorial is a pedestal raised on two steps, and surmounted by a square shaft, having a cap with the Royal Crown as a terminal. There are four panels of copper and brass. On one is the profile of Sir W. Bucknill in high relief, and on the other panels inscriptions are to be inserted. Above the panels are medallions, in which will be inserted the figures 1852, 1894, the monogram "V.R.," and the city arms. The memorial will be over 20ft. in height. The materials to be employed are Devonshire granite and Portland stone. The premium of £5 was awarded to the author of "Fortiter." This design was the work of J. Whitehead and Sons, of Aberdeen. The design represents a column surrounded by emblematic trophies and devices. The iron railing is formed by a trophy of rifles. The whole of the memorial, save where metal is shown, was to be of Devonshire granite. "Jan Ridd," whose design was regarded as too small, proposed that the memorial should be of Devonshire granite and Sicilian marble.

Weston-super-Mare.—For the three premiums offered by the local board for the best set of plans for a new market-house, the erection of which is to cost not more than £4,000, forty-two competitors sent in designs. The local board have selected that under motto "Floreat Westonia" for execution, and have awarded the first premium of £30 to its authors, Messrs. Hans Price and Wooler, of Weston; the second premium of £15 went, as we mentioned last week, to Mr. Sydney J. Wilde, also of Weston, in conjunction with his former pupil, Mr. H. D. Bryan, for their design "Cornocopia," and the third, of £10, to "Practical," Mr. Daniel Arkell, of Birmingham. The style of the selected design is Renaissance, in keeping with adjoining property in the High-street, which has been erected from plans by the same firm.

The Earl of Derby, G.C.B. will formally open the new park which he has presented to the town of Ormskirk, on Wednesday next.

A demonstration in support of the United Builders' Labourers' Union was held on Sunday afternoon at South Cray, under the presidency of Mr. Charles Shearman. Addresses on the advantages and future policy of trade unions were given by Mr. W. Stevenson, the general secretary of the union, and by Alderman H. R. Taylor, L.C.C., Messrs. Verdon, W. Beal, and others. On the same afternoon a similar meeting took place at Old Town, Southend-on-Sea, where Mr. W. Geard was the chief speaker.

On Monday week as a number of men employed by Mr. Forse, of Bristol, were engaged upon the erection of a house in St. Margaret's-terrace, Victoria-square, Weston-super-Mare, a mass of the cornice suddenly fell outwards on to a scaffolding platform some yards beneath, breaking one of the main supports. One of the masons named Henry Kidner, aged about 56 years, and residing in Palmer-street, was thrown into the roadway a distance of some 30ft. and killed. At the inquest held on the following Wednesday, evidence was given by Mr. Thomas H. Chalmers, the working foreman, and other men, and the jury in returning a verdict of "Accidental Death," stated "that the accident was due to the cornice stones falling on the scaffolding and breaking it up." The following rider was also added: "And the jury are of opinion that the cornice stones had been worked to such measurements and laid in such a way as to reach the limit of safety; and that, in future, care should be taken to 'tail' such stones further back on the wall so as to insure that there shall be no risk of the stones overbalancing."

ARCHÆOLOGICAL.

The Excavations at Delphi.—M. Homolle, Director of the Ecole Française of Athens, on the excavations at Delphi, has just reported to the French Government on the results of the excavations made at the Temple of Apollo, at the Treasury of the Athenians, and at the Treasury of Hellenico respectively. The area now excavated at the Temple of Apollo comprises the whole of the terrace which surrounds and supports the polygonal wall, that is to say, the temple itself and the space surrounding it on the east, south, and west sides, from 48ft. to 60ft. wide on the two former sides, and about 40ft. on the third side. On the northern side the two corners have been reached, and outside the wall a portion of the Sacred Way, 64ft. long and 32ft. wide, has been excavated at the north-east corner. But, notwithstanding the extent of these excavations, neither the fragment of a frieze nor any portion of a sculptured figure having belonged to the pediment has been discovered. This is regarded by M. Homolle as remarkable, and the complete absence of even fragments of decorative sculpture must be regarded as discouraging for the future. He conjectures that the Roman emperors posterior to Pausianas had the two groups of figures taken down very carefully piece by piece. The metopæ are supposed to have shared the same fate. M. Homolle seeks to give a description of the temple as it formerly existed. He says: "Raised on a stylobate composed of three high steps, the temple had the form of a periptera. In accordance with the custom of the 6th century, it had only six columns on the front, and was a very long building. To determine the number of columns on the side is a calculation which cannot be undertaken without a plan. To give one we must await the completion of the excavation, and we prefer to make no suppositions before having cleared away the ground from the fourth side of the temple." M. Homolle adds: "The discovery of the temple, the excavation of the Sacred Way intact throughout, the discovery of the monuments still standing beside it, and the considerable number of pieces of sculpture and inscriptions enable us to say our efforts have been rewarded." With regard to the Treasury of the Athenians, the discoveries since May have been important, and have, according to M. Homolle, had the double advantage of giving a firm basis for the interpretation of the subjects and for the order of distribution of the metopæ. Those discoveries now enable him to affirm that all the four sides of the building were decorated. About 30 slabs or portions of slabs, all the metopæ, have been brought to light, and the monument is now complete with its decorations. The work of excavation will be pushed on actively till winter.

The death of Mr. W. Varney occurred at his residence, Belgrave House, Lower Fant-road, Maidstone, on Friday morning. The deceased, who had reached the ripe old age of 94, was a director of the Burham Brick, Lime, and Cement Company, and for many years was the managing director of the works.

A largely attended vestry meeting was held at St. Peter's Church, Colchester, on Tuesday week, to consider the question of restoring the church. The vicar produced the amended plans of Messrs. King and Lister, which showed complete restoration in the Perpendicular style, the whole of the existing old work and the tower being retained. The cost of carrying out the entire scheme was estimated at £4,000, including the architects' fees. The plans were adopted.

On Thursday in last week, the Archdeacon of Northumberland laid the foundation-stone of a mission church at Lowgate, near Hexham. It is to be known as St. Mary's, and will form a chapel-of-ease to the Abbey Church of St. Andrew. Mr. Foster, of Newcastle-on-Tyne, is the architect.

At the Guildhall, Rochester, Major-General C. P. Carey, one of the inspectors of the Local Government Board, held an inquiry last week as to the memorial of the town council to be permitted to borrow £1,500 for making a corporation depot and stabling depot. The city surveyor, Mr. William Banks, produced plans of the depot, and explained the proposals of the corporation. The site was in Blue Boar-lane, conveniently near to the High-street.

Mr. W. J. B. Clerk, Local Government Board inspector, held an inquiry in the Congregational Schools, Heath Town, Wolverhampton, on Friday, into an application by the Heath Town Local Board for power to borrow £2,000, for purposes of sewage-disposal, private street improvements, and the formation of a new road to be called James-street.

Correspondence.

SHOULD ARCHITECTS ADVERTISE?

To the Editor of the Building News.

Sir,—How far may an architect go in the direction of advertising his profession? Those who are lucky enough to commence practice with plenty of capital to tide them over the first few years of waiting for clients assert that the beginner ought to be restricted to a big, boldly lettered brass plate on his door. Others adopt other tactics, so far as I can see or hear without protest from the professional societies, or loss of dignity with the public. Some take corner premises in suburban streets and flaunt large boards, describing themselves as architects, surveyors, estate and house agents, and I know not what besides. Others who have been intrusted with commissions rear above the hoardings of the works in progress signposts stating their name, address, and profession; or, if the estate is to be developed by them in conjunction with a solicitor, invite the attention of Mr. Buggins and his co-workers by gigantic boards. If he is successful in getting a commission for business premises or a mission chapel, this class of architects does not deem it derogatory to his professional status to incise his name as architect on the plinth or, better still, foundation or memorial stone. Yet another class without compunction advertise in the general newspapers. Here is a sample which I came across in the *Leicester Post*, and as to which I should like the opinion of your readers as to its legitimacy or otherwise. I will omit the name and address of the advertiser, as I do not see why you should be asked to give him a free notice, but I am told he has been in practice as an architect and surveyor in Leicester for many years, and therefore may be presumed to know the unwritten rules of professional etiquette. He was at one period a member of the Leicester and Leicestershire Society of Architects, but resigned his membership a long time ago. Doubtless when we have an Architects' Registration Act in force, such matters will be considered and dealt with by the General Council, but until this consummation, so devoutly to be wished for, is attained, every man will do that which seems right in his own eyes. Here is the advertisement I alluded to—what do your readers think of it?

MANCHESTER, SHEFFIELD, AND LINCOLNSHIRE RAILWAY EXTENSION (LEICESTER). Valuations and Claims made for Property, Business, &c., required for the above Railway, in the Parishes of St. Mary's, St. Leonard's, St. Nicholas, All Saints', and the Abbey by the Parochial Surveyor and Assessor. Terms on Application. Consultations Free.

—I am, &c., Registrationist.

NEW ASYLUM AT WINWICK.

Sir,—The proceedings in connection with this competition have been so extraordinary that a few facts, I think, will interest your readers. When the necessity for the provision of further asylum accommodation was decided upon, an open competition was instituted, and the Lancashire Asylums Board drew up and issued instructions to intending competitors, and also appointed an assessor to decide for them which was the best plan, having regard to the instructions sent to competitors. In response to the board's invitation, about 25 architects sent in, and the assessor made his award, giving the first premium to a firm who have designed and carried out more asylums than any other firm of architects, the second to a gentleman also celebrated for his asylums, and the third to a firm not totally unacquainted with this class of work. So far so good. But to the surprise of every one, the authors of the designs placed first and second are passed over, and the design placed third recommended for adoption by the committee. And the only explanation that is offered is that the medical superintendents of the other county asylums preferred this plan. The doctors, forsooth! However much they may know the defects in the working of their own asylums, they are no more competent to gauge the merits of a plan than an architect is to deal with an intricate medical case. If the doctors can design an asylum why should the county be put to the expense of a competition? They might employ a draughtsman to put their ideas on paper, and then, in conjunction with a firm of architects, carry out the work to completion. Is it possible that this has been done in this case? Since the decision of the committee has been published, a notice has appeared that the name of Mr. Skinner should have appeared in conjunction with those of the authors of the recommended design. Who is Mr. Skinner! His name cannot be found in any list of architects. Is he the "ghost" who prepared the plans, or is he someone inspired with more information than the other competitors? In any case, on the face of it, it is obvious to any practical man that this design could not have been prepared from the instructions issued to architects by anyone who understood this special class of work. It is a design for an *acute* asylum on a very expensive plan (in fact, the most expensive of all the 25 sets sent in), suitable for the reception of all classes of patients, with a full complement of single rooms and small wards, all very nice from a doctor's point of view, but very different from what the board advertised for. Their instructions asked for an asylum for the reception of chronic lunatics and imbeciles, and laid special stress on the economy to be observed, pointing at the same time to the chronic asylums of Caterham and Leavesden as examples. The committee's decision is at direct variance. Now, sir, I ask why Lancashire is to lose all the money it has spent on this competition, the fee paid to the assessor, and the benefit of his opinion, the premiums paid, and why the county should not have the benefit of the experience of the gentlemen who were awarded the first premium, and also why the county should be called upon to pay £50,000 more for the new asylum than necessary? Do the ratepayers know what they are paying and what they are getting for their money? Perhaps some explanation may be forthcoming from the chairman of the board, failing which the whole business will have the appearance of a "hole-in-the-corner" transaction hardly creditable to my county. Of course it yet remains to be seen what the Commissioners in Lunacy will have to say when a plan for an *acute* asylum is sent up for their approval after they have already approved a site for a *chronic* asylum. Comment on the unfairness to the authors of the designs placed first and second, who sent in plans in accordance with the instructions costing £50,000 less, is superfluous.—I am, &c.,

A Lancashire Man.

THE ELIZABETHAN BATH IN THE STRAND, W.C.

Sir,—Under the above heading the following appears in the September issue of the *Stonemason*:

"What Mr. C. Y. Sturge described in a contemporary as 'a rather bad piece of vandalism' now appears to be imminent. 'Many of your readers,' he writes, 'may be aware of the existence, in a little-frequented alley off the Strand, called Strand-lane, of an ancient Roman bath in perfect preservation, and still fed by the old natural springs by which it was supplied some 1,700 years ago. This bath, happily, is safe. Two or three years ago it passed into good private hands, and, by the kindness of the proprietor, can be viewed by the public any Saturday between 11 and 12. But adjoining it is a larger and comparatively modern bath of white marble, which is said to have been built by the Earl of Essex, in the reign of Queen Elizabeth. This bath was until quite lately in perfect order, and was still used for its original purpose. It measures, to the best of my recollection, some 10ft. or 12ft. in length, by, perhaps, 8ft. in breadth, and 5ft. in depth at the deepest part. It is fed by the same ancient spring as the Roman bath, the water in both being beautifully clear and cool—it is said that the temperature never rises above 45deg., even in summer, but that is certainly an exaggeration. The bath holds about 25,000 gallons of water, which changes daily. Some time ago the Duke of Norfolk, who is the ground landlord of much of the property in the neighbourhood, acquired the freehold of the small private house in which the Earl of Essex's bath stood. This, with some adjacent property, was then let on a building lease, and the new Norfolk Hotel, with its striking terra-cotta *façade* fronting on to Surrey-street, has been built on the site, and is now approaching completion. The new hotel has been let in turn on a long lease. Unfortunately, nothing seems to have been said in the course of these transactions about the bath. The bath itself is still *in situ*, but the water is being used for common building purposes, and the whole is threatened with speedy destruction.

The future proprietress of the hotel, naturally enough, looks at the matter from a business point of view, and says she needs the space for a larder. She is, however, quite willing to listen to any representations that may be made from a proper quarter, provided her interest does not suffer. Will not Mr. Walter Besant or some member of the Society for the Protection of Ancient Monuments take the matter up? Acts of what may be called unconscious vandalism are done ignorantly, and, so to say, innocently around us every day. In the present case, the Duke of Norfolk is probably entirely unaware that he recently parted with the control of one of the most interesting and beautiful relics of the Elizabethan period left in London. The lady who holds the underlease of the property had never so much as heard of the bath until her attention was called to its existence a day or two ago. The masons, indeed, knew of it, and, when questioned about it, expressed a mild regret that it should go, but supposed it to be inevitable. It is thus that London's heritage is bartered away bit by bit under our very eyes, the barterers themselves scarcely knowing or troubling to inquire what it is they barter! Is it too late to hold out a helping hand to save this interesting relic? The Duke of Norfolk is one of London's County Councillors. If the matter has, indeed, passed beyond his control, surely he will raise his voice to save an object of so much historic value to Londoners, his own private property, from destruction. The Essex bath is situated in the extreme corner of the hotel, and the small area which it covers could easily be detached, as to the basement only, from the hotel, and be reunited to the Roman bath property, from which it is distant only a few feet, and with which it was until recently in direct communication. The doorway which separated the two has only been bricked up for a few weeks."

I may add that this threatened bath was built entirely of white marble, in A.D. 1588, by the Earl—and tradition says it was first used by Queen Elizabeth. The water—as clear as crystal, and as "cold as charity!"—is perpetually flowing through it a rate, it is computed, of 10 tons per diem. For at least a quarter of a century, I never went to London during nine months of the twelve without having a bathe in it myself. Curiously, however, although I have often had American people as fellow-bathers, I never remember seeing an Englishman there.

Its close to the public, a few years ago, was a matter of great personal regret to me. Its total destruction would be quite a national loss.—Yours obediently, HARRY HEMS.

Fair Park, Exeter, 1st September, 1894.

LOCAL BUILDING REGULATIONS.

SIR,—A question involving the first principles of right and wrong has arisen between the executive committee of the Norwich City Council and a local builder. The latter is building a house of the value of £2,000, and has deposited his plans of same. The site is within the rateable area; but is not reached by the public sewer by about 500 yards. A cement-lined cesspool has consequently to be provided, and the occupier, not the corporation, will have to empty it, the annual expense of which will be about £8.

Now, the question is, Is it right, or in any sense justifiable, that the occupier should have to pay a private scavenger for this work, in addition to paying the public sewer rate—in other words, that he should have to *pay twice over* for the removal of his sewage? For, after all, a town council are only the agents of the ratepayers, and as such make out their demand notes to meet their expenses. But in this case the demand note is false: money is demanded for work which has been done, not by their servants, but by the private employés of a ratepayer. Hence, it would appear that the city council are obtaining money by false pretence, although, of course, not witn intent to defraud.

Perhaps some of your numerous readers may offer a solution, or some criticism, on this subject. The only solatium that the city council have offered is a promise that, at *some future time* the sewer will be carried past the building in question.—I am, &c., SURVEYOR.

SURVEYORS IN THE ROYAL ENGINEER DEPARTMENT.

SIR,—I have only just seen the correspondence relative to the pay and position of surveyors in the R. E. Department, which appeared in your columns last July, and I hasten to put forward a view of the question which seems to be a practical one.

In the first place, I would ask whether the young men who are likely to prepare themselves for this service are in the possession of such abilities, and are favoured with such a connection as would warrant them in expecting, with very little, or even with a great deal of trouble, to earn such a livelihood as they can obtain in the position of surveyors in the War Department?

Secondly, are they likely at the age of 65 to be able to retire from practice, having saved as much out of their earnings as would yield £250 or £300 a year? To do so they must be able to put by over £7,000! I am over 30 years in the profession, and I do not know of more than *one* man who has done so. But I know of many who have lived from hand to mouth for years, and are likely to do so all their lives.

Thirdly, I should like very much to know what it matters to a sensible person whether the colonel, the major, the captain, or even the lieutenant, or all of them put together, claim to have done the work which he does for the Queen. What does the public care who does it? And why should the surveyor care for anything beyond his duty and drawing his pay?

Fourthly, the social ostracism is a very delicate matter. Every person finds his own level. If men have not been in the habit of mixing in military society before they enter the War Department, why should it be a grievance if they are more or less debarred from it afterwards? If any one wishes for all the glamour which is supposed to attach to the life of an officer in the Army he has only—provided he can conveniently do so—to read hard in his youth and obtain the coveted prize.

So long as men wish to earn their bread in an honourable way, without any extraordinary pretensions to rank, so long will the office of surveyor in the War Department be sought after and filled.—I am &c.,

AN OLD R. E. D. SERVANT.

SIR,—I put off writing a second letter to you because there seemed to be an entire lack of interest in the discussion, and I did not care to engage in a duel with "One Who Is In It" on the subjects of registration and the employment of R.E. officers. I wrote in the first instance to warn the correspondents that outspoken condemnation of the R.E. officers over a signature showing that the writer belonged to the department, could only do harm to us, and to suggest that the case of the assistant surveyors might possibly turn out to be not such a desperate one after all. Registration and the civilian employment of R.E. officers have been argued in this paper and elsewhere at length, and I must decline to discuss them, merely saying that personally I have not made up my mind as to the feasibility or desirability of registration, and that I am heart and soul in favour of dismissing R.E. officers to their proper duties.

If you will allow me the space, I now propose to run over the letters which have appeared since I wrote, and notice one or two points, after which I must be permitted to retire gracefully or otherwise.

My phrase "ornamental head" has proved the red rag that I thought it would. Let me illustrate what I meant by following out the probable course of events if the reform laid down in the second paragraph of the letter from "One Who Was In It" was carried out. Say £60,000 is to be spent in barrack reconstruction at a given station. Conditions are drawn up (by whom?), and a helter-skelter rush is made by the profession, some hundreds of designs being sent in. Of course there would be a condition that no member of the permanent staff should be allowed to compete. *Who is to examine these designs?* At once I see the Hon. Thomas Noddy, and Lord Fitzbattleaxe, second cousin of the S.S.W., appointed "Competition Commissioners," with, of course, a general and a few colonels to advise them on technical points, a big staff of clerks, and a new class of Civil Service appointments under them, "examiners of designs in the office of the competition," "commissioners, technical training and qualifications necessary, &c., salary so much, with an ultimate prospect," and so on. Have we not seen it under our own eyes, in the appointment of the "Civil Service Commission."

Then, after the brains of the profession had been at work on the barrack problem for a few years, and a satisfactory type of design for every building had been evolved, that eminent architect Mr. T-Square, whose wife was a daughter of the Hon. Member for Eatanswill, would get the hon. member to point out the iniquitous waste of public money in premiums and 5 per cent. commissions, and the flagrant abuse of the existence of these highly-paid dummies, the "Competition Commission," and prove that economy would result from the establishment of a barrack design commissioner, with a staff, of course. Mr. T-Square, having pulled off several competitions, would be permanently appointed to a good berth near the top, and as this would throw Tom Noddy and his friends out of work, places would be found for them, and things would go on swimmingly, only the Civil Service vote would not be decreased much.

On page 129 the treatment of four eminent architects is referred to. I would add Leeming and Leeming to this list, and ask our friends "Was" and "Is" to settle between themselves the probable treatment that the competing architects dreamt of by "Was" will receive at the hands of their judges, for I suppose there must be a head, ornamental or otherwise.

Mr. Ingress Bell must be amused (he must have got over the annoyance stage) at the way his name invariably crops up. A little while ago every assistant surveyor was taught to regard Mr. Bell's presence in the first-class surveyor's list as one of our great grievances, the phrase "pitchforked into the department" being freely used. Now, it seems, he is one of our brightest ornaments. Mr. Tyndale has the same chameleon-like properties apparently.

The Office of Works, Admiralty, County Council, &c., are held up as free from the abuses under which we are struggling. I have heard a different tale from members of some of these departments. The fact is that Mr. Tite Barnacle, Civil Servant, is invariably an ill-used man; from the F.O. down to the most poorly paid and least thought of appointment, every one has his grievance; while the "temporary man" writes books to prove that Barnacle is retarding the ship of State (see Marvin, &c.); and to give the case a personal application, see letters from temporary men in last year's correspondence, or in *Engineering* the other day, ignoring our existence, or actually daring to say that *we*, the oppressed, the ground down, are too well paid for what we do.

"One Who Was In It" attacks my diagram with more zeal than discretion. It simply shows in pictorial form what he gave in figures, the dates of promotion supposing every one lives to 65, and that the upper classes are not filled up to 11 and 22 respectively. So he is disparaging his own case. Then I said *retirements* would average, have they not done so? I did not say promotions, that was my grievance No. 2. Again, surely he knows what is common gossip in the department, that two surveyors have sent in their papers, and the fact that Mr. Bowden, A.S., retired on Aug. 9.

In fact "Was" shows a disposition to unfair fighting, which I did not expect to meet in this correspondence, for I did not insinuate that the "profession" is lacking in dignity. I spoke of the members of the department. Do we not belong to the middle class? The term is vague; but it is well enough understood, and how should we be received by the members of the upper classes with whom we should have to deal if we were made heads of a department? But I forgot, "Was" wants us to remain in the lower division, as it would practically become.

Then why does "Was" refer to the paragraph on page 270 which suits his purpose, and pass over the three paragraphs immediately preceding which show that Republican America cannot manage these things better than (nominally) Monarchical England, R. E. officers and all.

It is remarkable to notice how we Englishmen alternately thank God that we are not as other men are, especially these foreigners, and laud the said foreigners' institutions to the skies. I should be very sorry to see England laced up to the choking point in uniform like Germany, bankrupt like Italy, covered with a pettifogging parasitical bureaucracy like France. or worked by "bosses" and "rings" like America. Our Civil Service is ridiculous and wasteful in many respects, like our form of government; but I am proud to think that it will stand comparison with any other.

The letter from "A Commissioned Officer" contains a statement which took away my breath. I could not help thinking that the ideal "architect," invented for argumentative purposes by "One Who Is In It," deserved a high place amongst the heroes of fiction, but this "Surveyor" "*at least the social equal, and invariably the intellectual superior !*" This beats any tombstone inscription I have ever heard of.

As regards the billiard-playing question, it might very well have some grounds; in fact, I have known surveyors who stood drinks at the sergeants' mess, and hob-nobbed familiarly with Tommy Atkins generally. We are not free from persons of this class now, either at the top or at the bottom of the list.

His remarks about the various army departments are interesting, showing what a happy united family these army officers, into whose charmed circle we are so eager to press, really are. I could suggest a few more pretty names, but will only give him one for the whole crew, "only butchers." It is perhaps necessary for me to say, considering the way some of my remarks have been misunderstood, that this is not my opinion. I regard the soldier's profession, as defender of his country, as a very noble one.

In conclusion I should like to say, avoiding the appearance of spitefulness if I can, that the great majority of the department would be very much obliged to "One Who Was In It," if he would kindly stay out of it. It is an open secret that the reduction of promotion is owing to the agitation and friction which has been going on lately, and "One Who Was In It," having got all he could out of the department, and now enjoying a pension, is doing his best to spoil the position of his former companions. I have no doubt his indignation is very righteous and all that, but perhaps he would not mind letting us manage our affairs in our own way.

One cannot help retorting to "One Who Is In It," and others, "Why do you stay in it, if the chains are so galling?"

Personally, I feel that I cannot have the whole earth; I must take the bitter with the sweet. In these days of strife and stress, security of tenure is a great consideration—let those who have gone the sickening round of architects' offices looking for a job, or undergone the equally sickening ordeal of waiting for the postman with the competition award, say. Theoretically, I am opposed to all figure heads. I would begin by clearing away the four generations of hereditary rulers and hangers on, and proceed downwards viâ the House of Lords, arriving at the R.E.C.S. in due time, till the ideal of "Looking Backward" was reached in a time when there should be no posing, no social ostracism, no self seeking or glorification at the expense of others, no downtrodden genius, no envy, hatred or uncharitableness; no anything in fact to stir a man's blood in his veins, or rouse him to ambition or "*sæva indignatio*," nothing but contented, sluggish, gelatinous mediocrity.

Meanwhile I am a Barnacle, and a Barnacle I hope to remain, sticking firmly to my "ultimate prospect."

I am glad my old friend Balbus was recognised, I think he must have been a Barnacle in his time, he was such an old grumbler. With a gem from his philosophy I wind up my share in this correspondence; his sage advice to "the boys," which might stand for the text of all my discourse, "Do not irritate wasps."—I am, &c., Balbus.

* * *

In connection with the refuse-destructor, Vauxhall-road, Liverpool, the Health Committee of that city have decided to erect, at a cost not exceeding £1,500, patent hydraulic machinery for making concrete slabs from the "clinker" left in the refuse furnaces. The slabs are used for street pavements.

Under the auspices of the University Extension movement a course of twelve lectures on "Gothic Architecture" is about to be delivered at Newcastle-on-Tyne, by Mr. D. H. S. Cranage, M.A., of King's College, Cambridge. The lectures will be given on successive Thursday evenings, commencing on the 20th inst. at the theatre of the Newcastle Literary and Philosophical Society, and the topics treated upon will be English architecture from pre-Norman to Perpendicular times, mouldings, timber roofs and screens, and architectural art.

An appeal on behalf of the buildings extension scheme of Aberdeen University has been issued. It is stated that the total expenditure is expected to be £140,000. The subscriptions already received, including £10,000 from the town council, and £20,000 from Dr. Mitchell, Newcastle, amount to £50,219, and the Government grant to £40,000, leaving to be raised in round figures £50,000.

Intercommunication.

QUESTIONS.

[11209.]—**Fire-Resisting Cement.**—Is there a cement which is a good conductor of heat, but which will not decompose or crumble on the application of a strong fire?—E. A. A.

[11210.]—**Lightning Rods.**—I have been told that, according to the latest scientific discoveries, lightning rods are useless, and may even be dangerous. Is this true, and if so, why? Any reference to papers by Prof. Lodge on this subject would be much appreciated.—Fasnacht Clayton, Manchester.

REPLIES.

[11192.]—**Building Lines.**—It is possible that the old building line was irregular, or that some of the lessees wished to set back to obtain light to the basement. "Critical" need not fear; such matters are inquired into very closely by the officials.—H. L.

[11193.]—**Chancel Screens.**—One of the best examples is certainly that at All Saints, West Dulwich, a fine church, altogether one of the best in South London. I remember many years since, when I was in the office of the late Mr. C. E. Giles, one of his designs for a church at either Lincoln or Yarmouth showed a similar stone screen, but the work was not executed.—H. L.

[11194.]—**Testing Drains.**—I advise "House" to allow the vestry officials to test the drains: otherwise they may serve him with a notice to reconstruct in accordance with recent legislation.—H. L.

[11196.]—**Joints for Stoneware Pipes.**—The "Stanfeld" joint is one of the best known. "H. D." should consult the trade catalogues.—H. L.

[11202.]—**Chapel Ceiling.**—All ceilings in places of public worship, assembly rooms for lectures, &c., should be horizontal with no obstruction (gas pendants excepted) for the passage of sound-waves; they are much better than open-timbered roofs.—H. N.

[11203.]—"**C.E.**"—These initials mean nothing—except that the man who uses them is mostly a quack, or else a fool. He either intends to gull a client into the belief that he is a member of the Institute of Civil Engineers, or he is idiot enough to think his name looks better with the added initials. The only man I ever knew honest enough to tell the truth was a patent agent, who when I asked him why he had tacked on "C.E." after his name, said bluntly, because he had found out "There was nothing like cheek in this world." If you want to be a civil engineer, you must be apprenticed to one and learn your business. If you want to be a member of the Institution of Civil Engineers, you must write to the Secretary, in Great George-street, for particulars of the necessary qualifications. It is not necessary to join, but you will do so if you are wise, because the Institution is a real and creditable representative body of the profession, just as the Institution of Surveyors is of that profession, and not, like the Institute of Architects, the representative of a section only. If you do *not* join, stand on your own merits, and don't ape quack doctors by plastering meaningless or knavishly intended initials after your name.—Kappa.

[11203.]—"**C.E.**"—"Engineer's" acquirements are hardly sufficient. Besides the building trades, land surveying, &c., he ought to understand the mechanical principles involved in various structures of stone, concrete, iron, and timber, and the elements of mechanical engineering. He should also learn hydraulic engineering, tunnelling, the sewerage of towns, &c. Articleship, though not absolutely necessary, is certainly desirable, to enable the student to pick up the practical knowledge of the profession. "Engineer" should get the programmes of the Institution of Civil Engineers, with the list of subjects required to pass the examinations, for information as to the courses. Engineering can be taught by entering one of the colleges—like the City of London College, Moorfields—where courses of lectures are given. Write for syllabus of lectures in the Engineering Department, White-street, Moorfields.—G. H. G.

[11203.]—"**C.E.**"—"Engineer" should, if qualified, get elected a member of the Institution of Civil Engineers; otherwise he will have no legal right to use these initials after his name.—H. L.

[11205.]—**The "Hermite" System of Treating Sewage.**—"Sanitas" had better consult the official reports published in France and New York. The Hermite process is called in New York the Woolf process, and is a mode of sterilisation by the action of chlorine compounds produced by the electrolysis of sea or salt water. I am not sure of the practical results obtained, but believe that, under certain conditions, the sewage has been improved.—G. H. G.

[11206.]—**Churches in Shropshire.**—If "S. S. S." isn't in a great hurry, he had better wait for a work now in the press, entitled "An Architectural Account of the Churches of Shropshire," by D. H. S. Cranage, M.A., illustrated by litho.-photos. by Martin J. Harding, and ground plans by W. Arthur Webb, A.R.I.B.A. (Hobson and Co., publishers, Wellington, Shropshire). The size of the book (2 vols.) is demy quarto—i.e., 11¼in. by 8¾in.—and it is to be issued in 5s. parts, at a cost of £2 10s. the whole book. I believe something like 200 ancient churches will receive attention therein, as well as a hundred or more modern ones.—Harry Hems.

[11207.]—**Oak Sills.**—Oak sills are, of course, more durable than good yellow deal; but then, again, it is much more likely to twist. When my own place was built in 1881, from designs by Mr. R. Medley-Fulford, F.R.I.B.A., we made all the exterior half-timbered work and interior doors, dados, &c., of oak; but the window-frames and casements of teak, because it does not twist. "A Builder's" query as to why deal is used more than oak in house-building is an old one. The main answer is that it is cheaper and easier to work. But, apart from that, oak is not always appreciated. The tobacco-shop front in the Euston-road, under the approach to St. Pancras Midland Station arrival platform, was put in, by the late Sir G. Gilbert Scott, in oak. The last time I noticed it all this woodwork was painted and grained!—Harry Hems.

[11207.]—**Oak Sills.**—"Builder" must have been studying the cheapest kind of speculative building, as oak or teak sills are used in all good work, with a galvanised water-bar fixed in a groove in both oak and stone sills.—H. L.

[11208.]—**Shape of Room for Sound.**—If in this inquiry it is meant length and breadth, neither length nor breadth has anything to do with sound; but the height has something more or less to be considered. No need to travel far for proof. No room ever yet built but what will speak for itself. The difficulty arises in not understanding it, and the best authority I can suggest for information on the subject would be those who use such rooms for the purposes rooms are intended to serve. That authority would be a sure guide to intending builders of a hall. Much consideration is required in this respect before plans are submitted. Any preacher or speaker, or even singer, can testify as to the acoustics of any place they had used in their vocation, by reason of the exertion or otherwise it requires for articulateness. An instrument (organ), be it ever so costly, loses much of its melody by being placed in a wrong position, which any musical ear can detect when sitting with the audience. After 40 years' experience in such matters, I may, without prejudice, make a few observations—viz., No room or hall used for public purposes should be more than 20ft. from floor to ceiling, if that is a level ceiling; nor more than 15ft. to the spring of rafters if an open-timbered roof. The platform raised 3ft. from floor, and ceiled at 8ft. from its floor. Objection to this cannot be tenable on the ground of ventilation, for in that there is no difficulty if preparation is made for that purpose in the course of construction. I do not mean the application of ventiducts, *alias* ventilators, be they ever so fantastical—those things are perfectly useless; but ventilation in its true meaning, for there is always in an assemblage of persons sufficient heat generated for that purpose.—H. Nichols, Wardleworth, Rochdale.

* * *

CHIPS.

The memorial stone of the intermediate schools for Penrith was laid by Lady Windsor on Wednesday week. The site of seven acres in Stanwell-road was given by Lord Windsor, and the building will be erected from designs by Mr. H. Snell, at a cost of between £7,000 and £8,000.

The will of Mr. William Edward Williams, of 46, Leicester-square, and of Wallington, Surrey, surveyor to the London and General Plate Glass Insurance Company, who died on July 7, has been proved, the value of the personal estate amounting to £9,914.

The restoration of the lofty Perpendicular spire of Newark parish church, which was struck by lightning and seriously damaged during the heavy thunderstorm in May last, has now nearly been completed.

A new hotel is in course of erection at Ham-place, Chelsea. The contract has been taken at £38,250 by Messrs. Stephens, Bastow, and Co., of London and Bristol.

The Rev. H. L. Nelthropp, the master of the Clockmakers' Company, has presented to the Guildhall Library the watches and clocks he had collected during the past forty years. They comprise between two and three hundred specimens, and will be arranged in a case now being specially prepared, to be placed by the side of the exhibit that has for some years been shown at the top of the steps leading from the lobby of the Guildhall Library into the Museum.

The Beehive Inn, in the narrow part of the Butter Market at Ipswich, is about to be reconstructed from plans by Mr. H. J. Wright, M.S.A., Museum-street, Ipswich, and will then contain fifty bedrooms and other apartments. It will be re-named the Grand Hotel.

The German Emperor and Empress and other high personages were present at the consecration of Professor Eucke's sarcophagi of the late Emperor William and Empress Augusta in the Mausoleum at Charlottenburg at noon on Sunday.

The Mansion of Gorgie, six miles north of Dundee, a house erected in 1614, was totally destroyed by fire on Sunday.

The foundation stone of the Passmore Edwards Free Library was laid at Redruth yesterday (Thursday) by Mr. J. Passmore Edwards. The building is being erected from designs by Mr. James Hicks, of Redruth, and was illustated in our issue of August 3rd last. Mr. John Symons, of Blackwater, Cornwall, is the builder.

The extensions to the Llanelly Hospital, which are nearing completion, are being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves, with descending smoke-flues, and patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

In the case of Henry Smith Holley, of Wellington-street, Strand, W.C., and Great College-street, Abingdon-street, S.W., architect and surveyor, the discharge from bankruptcy has been suspended for three weeks, ended August 31 last. The public examination was concluded so long ago as March 13, 1885.

Legal.

WHO IS THE "OWNER"?

IN the complex dealings with property which so constantly occur where there is a lease and an under-lease of the same premises, confused by assignments from both lessee and under-lessee, it is often very difficult to find out who is the "owner" within the meaning of the statutes as the person liable to the local authorites for any nuisance. This was well shown in a recent case that arose about a public-house in Camberwell, and in which the brewers, Truman, Hanbury, Buxton, and Co., had been made liable for certain structural nuisances to the property by order of a police magistrate, as being the "owners" within the meaning of Section 141, of the Public Health (London) Act, 1891. This decision had been confirmed by Quarter Sessions, from which it now came up to a Divisional Court by way of appeal. The various interests in the property stood in this way. The brewers, the appellants, were assignees of the original lease for the remainder of a term of about 39 years from 1885, and the occupier was assignee of an under-lease for the same term, less a few days, which had been granted by the lessee. The same rent of £50 a year paid by the occupier to the brewers was by them paid over to the lessee, so that they got nothing out of the property as rent. The original lessee had been paid a premium when granting the under-lease, and the present occupier had paid a larger one on his assignment.

In this state of things the question for the High Court was whether the brewers had been rightly convicted as "owners" liable to abate the nuisance under the statute. The section defined an "owner" as the person receiving the rack rent of the premises; but as to this the judges held that none of these parties came within that part of the definition. But then the clause went on to say "who would so receive the same if the premises were let at a rack rent." Now, as the judges of the Divisional Court pointed out, the brewers, as assignees of the lease, subject to the existing under-lease, could not receive any more than the £50, which they in their turn paid over, and they could not, therefore, be the owners; but the occupier, who chose to use the place himself, could let it if he liked, and he would be able to do so at a rack rent. Therefore he was the only person who, if the premises were let at a rack rent, could receive that rental, and so, besides being the occupier, he was also, legally speaking, the owner, as having the largest substantial interest in the property. The conviction was therefore quashed as against the brewers, and the assignee of the under-lease was declared to be both owner and occupier, and therefore responsible for the nuisance.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

T. and M.—Light and Air.—Prescription Act.—The time is still 20 years, and it has not been reduced. The Act to which you refer was passed in 1874, and reduces the time within which actions for the recovery of land, &c., must be brought from 20 years to 12 years. It is thus a statute of limitations, and has nothing to do with the period of prescription for easements.

Chain.—Appraiser.—License.—The law has not been altered, and the appraiser's license can be obtained for £2 per annum at the Inland Revenue Offices, Somersrt House. That should be sufficient for all the purposes you mention.

J. B. F.—Stone.—Building.—Dispute.—You seem to have a fair claim, upon the facts stated, especially as the letter received would most probably be held to be a compromise up to its date. But there is really no legal question involved that can be answered here. An action should be brought, and then the claim will probably go to arbitration, or be met by some sort of arrangement of compromise.

◆

At Ilkley, on Friday, Mr. F. H. Tulloch, M.I.C.E., one of the Local Government Board inspectors, inquired into an application by the Ilkley Local Board for sanction to borrow £2,600 for improving and enlarging the gasworks recently acquired at a cost of £59,168 6s. 10d.

The excavations which are going on at the cemetery of St. Emilien, Nantes, have already led to discoveries of ancient stone coffins, some of them being highly decorated. A pagan temple evidently stood upon this spot before it was converted to Christian uses, and traces of the foundations have been brought to light.

WATER SUPPLY AND SANITARY MATTERS.

Glasgow.—At a meeting of the Sewage Committee of Glasgow Police Commissioners on Monday, approval was given to a scheme prepared by Mr. M'Donald, the city engineer, for the erection of sewage purification works at Dalmuir, similar to those at Dalmarnock, for dealing with that part of the sewage of the city on the north bank of the Clyde not touched by the east-end works. The scheme proposes that the greater part of the drainage area to be dealt with, covering 4,500 acres, shall be carried in a gravitation sewer, without pumping, to the corporation lands of Dalmuir, and there purified; and it is also proposed that the lower levels of Glasgow and Partick, extending within the city boundary to 800 acres, be pumped into an outfall sewer at a station on the Kelvin.

Halifax.—A scheme for dealing with the bulk of the sewage of the borough is to be brought before the next meeting of the Town Council. The council will consider a resolution to apply for the sanction of the Local Government Board for power to borrow £8,000, for the purchase of 10a. 3r. 1p. of land at Salterhebble, for sewage filtration works, &c. Salterhebble is at the lowest part of the borough, and so placed that 7,689 acres out of 8,209 acres, being the area of the borough, are drained to that point. There are to be settling tanks and precipitating tanks for chemical treatment of 3,000,000 gallons in 24 hours. This scheme is estimated to involve an outlay of £21,841 10s.

Upper Airedale.—Mr. Tulloch, M.I.C.E., of the Local Government Board, held an inquiry at Eastburn, on Friday, as to an application from the Keighley Rural Sanitary Authority for power to borrow money for sewering and sewage disposal at the villages of Sutton, Sutton Mill, and Eastburn, and disposal works for the village of Steeton. Mr. R. B. Broster, the engineer, explained that in Sutton, Sutton Mill, and Eastburn, with a total of 534 houses, the daily sewage from an estimated population of 2,670, was estimated at 80,100 gallons per day, and this it was proposed to treat on a four-acre site, the total cost of the undertaking being £6,476 9s. 3d. Steeton had already constructed a sewerage system, and a field had been purchased adjoining the Aire, the cost of the scheme being £1,546 15s. 9d. Both systems would be on the principle of intermittent downward filtration.

CHIPS.

The statue of Edmund Burke, which has been presented to Bristol by Sir W. H. Wills, will be unveiled next month by Lord Rosebery. It has been cast in bronze by Mr. Havard Thomas, and placed in position on its pedestal of Scotch granite by Messrs. W. Cowlin and Sons, of Bristol. The statue, which is 9ft. 6in. in height, and is raised on a pedestal some 14ft. above the roadway. It faces the Harbour at St. Augustine's parade. The orator is represented in the dress of his day, and in the act of addressing an audience.

The custodiers of the National Wallace Monument journeyed to the Abbey Craig at Stirling on Friday, and inspected several improvements which have recently been made on the monument. The most important of these is a series of four indicator maps placed on the very top of the monument, showing all the interesting features of the landscape, and which will be of advantage to the numerous visitors who annually visit this spot. The maps were all executed by Mr. James Shearer, Stirling.

An organ, built by Mr. Banfield, of Handsworth, was opened on Friday at the Congregational Chapel, Union-row, Handsworth.

At the last meeting of the Aberdeen Harbour Board it was decided to extend the wharf on Regent Quay (Upper Dock) by 410ft. and to erect a shed 22ft. in length by 35ft. in width. The estimated cost is £5,227. The wharf on the south side of the basin will also be extended by 260ft.

On Tuesday week Mr. John Melrose, builder, Leith, who had gone to Crieff with a friend on the previous day for rest and change, committed suicide in his bedroom by inflicting a wound in his neck. Mr. Melrose had been in business in Leith for about 25 years, and was at one time manager of the Sailors' Home. For many years he conducted a Sunday school in the town, and took an active part in the affairs of the session of North Leith Church, of which he was one of the oldest members.

A church erected at Bridgend, Perth, by the Perth United Presbyterian Church Presbytery, was formally opened last week by the Rev. Dr. Smith, Edinburgh. The church is seated for 550 persons, and is estimated to cost £3,500.

The Eccles Town Council have applied to the Local Government Board for power to borrow money for the provision of a town's yard for the borough. Plans have been prepared by the surveyor (Mr. A. C. Turley, C.E.), and the work is estimated to cost about £7,000.

Our Office Table.

The three chief provisional autumnal art exhibitions, at Manchester, Liverpool, and Birmingham respectively, were opened on Monday. They include, as usual, many of the most attractive pictures shown this summer at Burlington House and the New Gallery, and a number of fresh works of interest and value. The twelfth exhibition at Manchester contains Leighton's "Spirit of the Summit," Watts's "Man who had Great Possessions," Stanhope Forbes's "Quarry Team," Hacker's "Temptation of Sir Percival," and Holman Hunt's "Importunate Neighbours;" landscapes by MacWhirter, Murray, and North; seascapes by Henry Moore, Henry Summerscales, and Brett; a military portrait group by Chevallier Tayler; decorative subjects by Grieffenhagen, Poynter, and Brangwyn; and *genre* pieces by Morris, Leslie, and Dendy Sadler. The best works of the Glasgow school are Lavery's "Le Soir," and "A Lady in White" by Mouat Loudan.

At the Walker Art Gallery, Liverpool, Watts's "Eve" and his portrait of Walter Crane are easily first, and other well-known works are Henrietta Rae's "Psyche at the Court of Venus," Briton Riviere's "Beyond Men's Footsteps," lent by the Chantrey Trustees. The weird Academical study of "The Sea Maiden" ennetted by fishermen, by Herbert Draper, and T. C. Gotch's "Child Enthroned" will attract much attention. The architectural subjects include two interiors of French Cathedrals—Rheims and Lyons—by Wyke Bayliss; "Greenwich Hospital," by T. B. Hardy (all three in water-colours); and two views of "Whitby"—one by Terrick Williams and W. Llewellyn. Impressionist works are contributed by Grieffenhagen, Hitchcock, W. Stott (of Oldham), and Robert Fowler. Well-known pictures are "Le Roi s'Amuse," by W. F. Yeames; Val Prinsep's sensational "A Versailles," and MacWhirter's "Flowers of the Alps."

At the Royal Society of Artists, Birmingham, a notable work is Holman Hunt's brilliant "May Meeting on Magdalen Tower, Oxford"; and others are H. S. Tuke's "Autumn Blue" (a loan from the Chantrey Trustees), Hacker's "Circe," J. C. Hook's "Before Sundown," and Bramley's "After Fifty Years." Two views of "St. Ives' Bay" are shown by Moffat Lindner, and the portraitists include Alma Tadema, Herkomer, Sargent, and Glazebrook. Alfred East's "May Morn" and other landscapes by Parsons, Walter Langley, Fullwood, E. R. Taylor, and Clarence Whaite are worth attention. Watts is represented by his "Greek Idyll," from the New Gallery this summer, and Leighton by the head and bust of a little girl. The water-colours are especially strong at Birmingham this year.

The art gallery which the corporation of Blackburn have added to their museum and library buildings was opened on Friday with a loan collection of pictures, the aim being to form a permanent collection of pictures for Blackburn. The nucleus of such a collection already exists in the works given to the town by the late Mrs. Dodgson, Mr. Ainsworth, Mr. W. H. Hornby, M.P., and others, and in a few pictures recently purchased by the committee themselves. The latter include Marcus Stone's "Two's Company, Three's None;" "A Fine Day in Autumn, North Wales," by B. W. Leader; and also the popular picture by Alfred W. Strutt, entitled "Move On"—a policeman issuing his commands to a coster-woman whose donkey has just upset her cart of vegetables and fruit. The loan collection includes some 300 pictures, representing many schools of contemporary English work. Sir F. Leighton is represented by "The Last Watch of Hero," lent by the Manchester Corporation, and two small studies sent by himself. G. F. Watts has lent "Death Crowning Innocence." Mrs. Thwaites lent Sir John Millais's "A Deserted Garden," Rosa Bonheur's "The Horse Fair," the late Edwin Long's "Diana or Christ?" "The Interior of the Duomo at Milan," by David Roberts, and "Worn Out," by Thomas Faed. "A Spate in the Highlands," by Peter Graham, has been lent by Sir W. C. Brooks. Among other notable works are "Balaclava," and "Listed for the Connaught Rangers," by Lady Butler; Professor Herkomer's "Hard Times" and "The Last Muster," A. Hacker's "The Annunciation," "The Passing of Arthur," by Frank Dicksee; "News of the Spanish Armada," by Seymour

Lucas; the late Keeley Halswelle's "Royal Windsor;" J. W. Waterhouse's "Danae;" Clarence Whaite's "Thirlmere," and a fine example of Joseph Israels. The collection also includes two small Landseers, pictures by Colin Hunter, M'Whirter, Briton Rivière, W. P. Frith, G. D. Leslie, Goodall, Ansdell, Linnell, sen., Henry Moore, E. M. Ward, P. R. Morris, the Hon. John Collier, Sir John Gilbert, G. A. Storey, and C. Napier Hemy.

The excavations carried out during the past season at Abæ, in Phocis, by the British School of Archæology, have—says a correspondent of the daily press—yielded results of considerable interest. The site of the ancient sanctuary has been explored, as well as that of a later temple, erected by the Emperor Hadrian. These buildings appear to have stood within a sacred inclosure, surrounded by a wall of polygonal masonry. The foundations of both temples have been laid bare, as well as those of a long double stoa. Inside the *temenos* were found some bronze bowls of Cypriot and Phœnician workmanship, dating from the 6th century B.C. Fragments of an inscription recording the restoration of the older temple in Roman times were also discovered. Excavations at the neighbouring site of Hyampolis were rewarded by the discovery of a number of inscriptions dating from late Greek and Roman times. The explorations at Abæ and Hyampolis were begun under the direction of Mr. Ernest Gardner, and completed by Messrs. Bather and Yorke. A member of the school has gone to Alexandria, where a site adjoining the ancient mosque below the fort of Kom-el-Dik, long identified by tradition with the site of the tomb of Alexander, will be excavated.

At the recent meeting of the American Association for the Advancement of Science, a paper was read by Professor Thomas H. Norton, a Cincinnati chemist, on "The Battle with Fire," in which he treated the great problem of lessening the annual destruction of property through conflagrations from a novel standpoint. Professor Norton recurred to chemistry for means of resisting fire, and many of his suggestions are very useful. He called attention to the valuable properties of the silicates, of hydrate of alumina, and of borate of magnesia as applications for rendering woodwork uninflammable, arguing that if such applications cannot make wood fireproof, they at least delay its burning, and so give time for escape and the arrival of fire-engines.

At Wednesday's session of the Trade Union Congress being held this week in St. Andrew's Hall, Norwich, resolutions were passed pressing upon the Government the necessity of at once re-introducing the Employers' Liability Act Amendment Bill, and stating that, in the opinion of the delegates, it is highly desirable that competent practical inspectors should be at once appointed to supervise the construction of all public works requiring the sanction of Parliament. The Parliamentary Committee were instructed to take steps to make employers liable to workmen for loss and damage of tools while on their premises by the occurrence thereat of a fire.

A meeting of United States exporters of hardwood lumber was held at Roanoke, Virginia, on July 24, and a permanent organisation effected under the style of the Association of American Timber Exporters. Coleman Rogers, of Cearfoss and Rogers, of Hagerstown, Md., was elected president, and H. N. Saxton, jun., of Saxton and Co., of Knoxville, Tenn., secretary and treasurer. A number of firms were represented, and the question of railroad and ocean rates was discussed. A standard of inspection and measurement to govern export shipments was also considered. Considerable criticism was offered at the rough handling lumber shipments received at the hands of the steamship companies. Several other important matters were discussed at length; notably the depressed condition of the European markets, the cause and the methods for relief. A number of letters from prominent foreign firms were read, condemning the manner in which the European markets were being flooded with consignments from shippers entirely ignorant of the requirements of the export trade.

At St. Pancras Vestry meeting on Wednesday the General Purposes Committee reported that, in answer to a request from the vestry to the London and North Western Railway Company that the latter would expedite the construction of the proposed public foot-bridge over the railway at Gospel Oak to Parliament-hill Fields, the Company stated that the bridge was not to be built by them, but by the London County Council. The committee had understood that there was an arrangement between the Council and the company whereby the latter should erect the bridge, and the Council pay £2,400 towards the cost, the company paying £175, and the St. Pancras Vestry undertaking to form the southern approach to the bridge. Mr. Wetenhall, L.C.C., explained that he had been in correspondence with the engineer of the London County Council on this subject, and learnt that the Council had been awaiting since January last the receipt of plans and specifications from the railway company, which had only just come to hand. The engineer would report on them at the first meeting of the Council's Improvement Committee. The arrangement with the railway company was that they should do the work, and the letter from their secretary to the vestry was, the engineer declared, "an attempt to depart from that arrangement."

CHIPS.

The name of William Henry Waterman, of King's Arm's-yard, Moorgate-street, E.C., architect, appears in Tuesday's *Gazette* in the list of adjudications in bankruptcy.

A new school for girls and infants was opened at Polruan, Cornwall, on Monday. It has cost £1,300, and has been built by Mr. N. Panter, of Polruan, from plans by Mr. William Swift, of Truro.

A convalescent home is in course of erection at Colchester, as a branch of the Middlesex Hospital. The contractors are Messrs. H. Everitt and Son, of Colchester, whose tender was accepted at £18,475.

A scheme is afloat for constructing a canal between Marseilles and the Rhone. The length is 34 miles, of which about 4½ will be tunnelled underground. The average depth is 10ft. between Marseilles and Port de Bouc, and 6½ft. the rest of the way. The total cost is estimated at £3,200,000.

At Hurst Hill and at Lower Gornal, in the Sedgeley school board district, buildings to accommodate 350 and 450 children respectively, from plans prepared by Mr. A. P. Brevitt, architect to the board, have been erected by Messrs. T. Jones and Sons, of Sedgeley, and Messrs. T. Tildesley, of Willenhall. The cost of each of the schools is little short of £4,000. Both buildings were opened on Monday.

The students from the Glasgow and West of Scotland technical school were successful in the recent South Kensington examinations, gaining a bronze medal in the National competition, and various other prizes.

The large painting of "The Glaciers of Rosenlui," by the late Vicat Cole, R.A., has been added to the South London Fine Art Gallery, Reading-room, and Lecture-hall, Camberwell.

It is proposed to form a local company for constructing a new pier at Minehead, at the back of the existing one, and available for any state of the tide. The estimated outlay is £7,500.

The members of the Northern Architectural Association will make an excursion to-morrow (Saturday) afternoon to Blaydon and Axwell Park.

The single line of railway from Dumfermline to Charlestown and Limekilns, which has hitherto been used for the carriage of minerals only, was opened on Saturday for passenger traffic.

Between 50 and 60 members of the Bradford Historical and Antiquarian Society journeyed to Malton on Saturday afternoon to inspect the many objects of antiquarian interest in and about that old town; but mainly to visit the fine Gilbertine Church of St. Mary, Old Malton.

From time to time various schemes have been suggested for providing Lynton with railway accommodation. The latest plan embraces a line from Barnstaple by way of Goodleigh, Chelsham Bridge, Bratton, Blackmore Gate, and Parracombe, to Lyn Bridge, and the cost is estimated at £70,000.

For the erection of the Wintringham higher grade school at Grimsby, the school board of that town have accepted the tender of Messrs. Hewins and Goodhand, of Grimsby, at £8.572 10s. The total cost of the school, including site, architect's fees, and furnishing will be £11,900.

A new gasometer has been erected by the gas company at Bourne, Lincolnshire. It is telescopic, on Gadd and Mason's principle, without guide framing. Its capacity is 40,000c ft. The inner lift is 42ft. 6in. in diameter, by 14ft. in depth. The outer lift is 44ft. 6in. by 14ft. in depth. On the outside of the inner lift are five spiral guides of steel rail, fixed at an angle of 45°. The guide-rollers of the outer lift work upon these. The work has been carried out by Messrs. R. and J. Dempster, Newton Heath, Manchester.

Trade News.

WAGES MOVEMENTS.

Bolton.—A largely-attended meeting of the Bolton and District Master Builders' Association was held on Friday, and it was decided to lock out the whole of the men engaged in the several branches of the building trade at once, with the view of bringing to an end the strikes which have been proceeding for some time in the plumbing, bricklaying, and stonemasonry branches. The employers assert that the men's unions have become so aggressive in regard to certain details of work that the lock-out is necessary. Over 1,000 men are directly affected.

Glasgow.—The operative masons and stonecutters of this city are fully employed, and from 500 to 600 additional masons and builders could easily find employment. Notwithstanding the depression in other trades, master masons have been short of men for a considerable time now, and there is a standing difficulty in procuring a sufficient number of men to carry on the various works in process of erection so as to fulfil contracts. Besides a large number of tenement buildings, there is unusual briskness in erecting large structures in the city. The standard for the year ending April next is 8½d. per hour. Notwithstanding the great increase of the city, it is said that in 1874 and 1875 there were more masons, builders, and hewers than there are at present.

Isle of Wight.—The bricklayers and labourers who have hitherto been working for Messrs. Garlick and Horton, of 43, Sloane-street, Chelsea, the contractors for the lunatic asylum works at Whitecroft (2½ miles from Newport), now being built at a cost of £49,000, came out on strike for an advance of a penny an hour. The bricklayers in the employ of the contractors for the barracks at Parkhurst have also struck for a like reason. The amount paid to bricklayers on the island is 7d. an hour, to which it was advanced at Whitecroft from 6d. in July. At Southampton the rate paid is 7½d., and at Portsmouth 8d. The strike has since ended at Whitecroft in a return of the men at the old rates.

Paisley.—A strike of plasterers took place at Paisley on Monday, owing to the masters refusing a demand made by the men for an increase of ½d. per hour, which would bring their wage up to 8½d. per hour, equal to the rate in Glasgow. The men also ask for a guarantee that a further increase of ½d. be given in March next. The masters refused the advance, on the ground that the state of trade did not warrant it, and referred the men to an arrangement made in March last, whereby the present wage was to continue in force for a year.

Among the Acts which received the Royal Assent at the close of last session was the Quarries Act, which protects workers in quarries by placing them under the supervision of inspectors of metalliferous mines, and extends certain provisions of the Mines Act to workers in dangerous quarries.

Several projects are on foot for new buildings at Morecambe, which ought to make work plentiful in that watering place during the next few months. They include a pleasure pier with pavilion for 1,500 persons at the west-end of the town, opposite Regent-road, the rebuilding of the Queen's Market and fancy bazaar, the erection of new offices by the Lancaster Banking Company, a Catholic church, and new hotels at the west-end and in Lancaster-road.

Foundation-stones of a Wesleyan Chapel and school were laid at Boldon Colliery on Friday. The buildings will be Gothic in style, and erected in red brick with stone dressings. The chapel will be seated for 300 persons, and the schools will accommodate 300 scholars. Messrs. T. A. Page and Son, of South Shields, are the architects, and Mr. Robert Allison, of Whitburn, is the builder.

The Watlington (Oxon) School Board, in compliance with the urgent request of the Education Department, have arranged to make important enlargements of the board school buildings, and plans, sections, and specification have been prepared by Mr. R. Spyer, architect, of the Market-place, in the above-mentioned town. Tenders for these works are being advertised for.

The opening of the new City of London School for Girls, founded by the late Mr. W. Ward, will take place on Thursday next, the 13th inst. The school, which is situated in Carmelite-street, off the Embankment, has been built at a cost of £20,000, including fittings. It has a frontage of 71ft. 6in., and a depth of 51ft. 6in., is five floors in height, and will give accommodation for 300 girls. The façade is in Portland stone, and Anglo-Italian in style. The architect is Mr. Andrew Murray, the City surveyor, and Messrs. Atherton and Latta were the contractors. We illustrated the building by a perspective and plan in our issue of Dec 2, 1892.

CHIPS.

The Pershore Rural Sanitary Authority have instructed Mr. J. E. Willcox, C.E., of Birmingham, to prepare plans and specifications, and obtain tenders for the works of water supply at Wyre and Bishampton.

The Bishop Auckland Local Board resolved on Tuesday to apply to the Local Government Board for leave to borrow a sum of £11,000 for the carrying out of a sewage-disposal scheme.

A great fire occurred on Saturday at Fyne Court, Broomfield, about six miles from Taunton, and resulted in the destruction of a considerable portion of one of the finest and most important mansions in Somersetshire. The central portion of the house, its oldest part, was destroyed; but the pictures and most of the furniture and books were saved. The damage is estimated at £4,000.

About £14,000 have been spent by the City Corporation in building new offices at Guildhall and generally improving the accommodation for the staff of officers. The work, which has included the building of new quarters for the town clerk's, chamberlain's, and surveyor's staffs, has extended over two years. A sum of 200 guineas has also been expended in fitting the main entrance with new oaken doors, which have been designed by Mr. Andrew Murray, the surveyor to the corporation. The doors are of 15th-century design, and harmonise with the other work at Guildhall.

Mr. Arthur Montefiore, hon. secretary of the Jackson-Harmsworth Polar Expedition, who is better known to most of our readers as the secretary to the Society of Architects, has just returned to England from Archangel, vià Moscow. He states that the latest intelligence received of the condition of the ice between that port and Franz Josef Land is favourable to the advance of the expedition.

The waterworks committee of the Manchester Corporation contemplate inviting the Prince of Wales to open their great works at Lake Thirlmere next month. The heavy rainfall has raised the water to a level that makes it inadvisable to keep all standing till next spring or summer, and therefore the opening will not be deferred, as was lately proposed.

At a meeting of the directors of the Highland Railway Company, on Wednesday, it was resolved to make application in the ensuing session of Parliament for powers to construct a line of railway from Inverness to Spean Bridge and Fort William. The new line, which will be 58 miles in length, will cross the Caledonian Canal at Bona Ferry, and will keep to the west side of Loch Ness to Fort Augustus, and again crossing the canal, will run along the eastern shores of Loch Oich and Loch Lochy to Fort William. The branch line from Gaerlochy to Spean Bridge will form a junction with the West Highland Railway.

At the Wallasey local board offices last week, a Local Government Board inquiry was held by Mr. Thomas Codrington, M.I.C.E., Inspector to the Board, into the application of the Wallasey local board to borrow the sum of £38,000 for the purpose of extending the Marine Promenade from the Magazines to Rock Point, New Brighton. Mr. Danger, clerk to the local board, said that the board were desirous of extending the promenade from Marine-terrace to Egremont Ferry. The length of the proposed extension was 3,700ft., making, with the work already carried out, a distance of a mile and a half. The width would be 45ft. It was intended to carry a sewer along the whole length of the promenade.

The Walsall Union Rural Sanitary Authority have called in Mr. J. E. Willcox, C.E., of Birmingham, to prepare schemes for the sewerage and sewage disposal of the districts of Pelsall and Rushall.

A portrait of the late Alderman James Park, the second mayor of Bury, Lancashire, was formally presented to the corporation of that town yesterday (Thursday), and was hung on the wall of the council chamber, with other portraits of local men.

BILLS OF QUANTITIES & PLANS.

T. PETTITT and CO. Lithograph Bills of Quantities with the greatest expedition. Accurately copied from the draft in clear hand. Orders from the country returned by evening mail on the same day. Terms on application. Also Plans of Building Estates and General Plan Work at very reduced prices.—T. PETTITT and CO., Lithographers, 28, Frith-street, Soho, London, W. Established 50 years.

DOULTING STONE.
CHARLES TRASK & SONS.
DOULTING, SHEPTON MALLET.
London Agent:
E. A. WILLIAMS, 16, Craven Street, Strand, W.C.

FAMBRINI & DANIELS,
Manufacturers of IMPERISHABLE CONCRETE MASONRY for
CORNICES, STRING-COURSES, MODELLED PANELS,
And Every Stone-Work Requisite.
LANDINGS and **Plain** or **Moulded** and **Mitred STEPS**, durable throughout.

VOL. LXVII.—No. 2071.

FRIDAY, SEPTEMBER 14, 1894.

THE EVOLUTION OF THE BOARD SCHOOL.

"IF we cannot help making mistakes," said Goethe, "we must at least take care to build none." The aphorism is reasonable enough, but to follow it is not quite so easy as it looks. Its observance has proved too hard even for the combined wisdom of the nation, as concentrated for many years past in the Education Department. The London School Board, too, have, at any rate till lately, found it among the things that were too high for them, as their own architect, Mr. Bailey, not long since admitted. With country school boards the case seems to have been even worse. For years model plans were issued by Government authority. They were more or less closely copied all over the kingdom. School managers came to look upon them as types which it was perilous to tamper with or deviate from; and yet we are now told in so many words that if these very plans were submitted to the authority which formerly issued them, they would be at once and unhesitatingly condemned.

The public naturally ask who is responsible for this state of things. If half the school buildings in the country were more or less unfit for their purpose, somebody, it is assumed, must be greatly to blame. But this is by no means certain. Parents do not blame their tailor because the clothes which fitted a boy at ten fit him no longer at twelve or fourteen. If they had been made to suit him when he had reached the latter age, they would have been useless to him till he did. So it is with many of our school buildings. Elementary education, like the children it deals with, has been, and is, in a state of rapid growth. It has got too big for its early integuments; but there was a time when nothing more advanced would have fitted it so well.

Fifty or sixty years ago elementary schools were worked on a very simple system. As many children as possible were brought together and shut up in a large room. At one end of it was the master's table. There were a number of forms and desks in front of him, and in most cases whatever was taught, he taught himself. His only assistant was a cane or a ruler. Those details in a lesson which he could not explain he sought to instil into the pupils' minds by a forcible application of the lesson-book to their heads. But, as a general rule, explanations were neither asked for nor given. What was learned was learned by rote. The children in a body repeated line after line at the tops of their voices, and when they had done so for a sufficient time they were supposed to "know their lesson." This sort of training did not do much for their minds. But it was an admirable exercise for their lungs; and in country places the learners, after two or three terms, became highly qualified to sit on walls or gates, and scare the birds away from the corn.

The Lancasterian system was an advance on this. There was still only one large room, with the master stationed at the end of it. But he was now assisted by a number of the more advanced scholars under the name of "monitors." The middle of the room was filled with benches and desks, but a wide space was left along each side between the seats and the wall. In this space, at intervals, semicircles 5ft. or 6ft. wide, were marked on the floor. The base of the wall formed the diameter of each semicircle, and its circumference was permanently outlined by a piece of hoop-iron, bent to the shape, and nailed down. The monitor stood within the space. On the wall behind him were maps, reading lessons, or problems in arithmetic. The class stood round with their toes touching the curve, and read, or asked and answered questions about the subject of the diagram. There were thus five, ten, or sometimes more classes, all receiving instruction in different subjects in the same room and at the same time. Discipline was better observed than it had been, for the Roman maxim, "Divide and govern," applies to schools as well as to nations. But the noise was intolerable. There was a worse confusion of sounds than in the old days of learning by rote. A good deal of useful education was given, but it was given under conditions which were very "wearing," both for teachers, monitors, and children. It was with the Lancasterian system, however, that school planning, as an art, seems to have made its first beginnings. Almost anything with four walls and a roof served to shut in the herd of children who, in the early part of the century, constituted an elementary school. But on the Lancasterian plan a room of one shape began to be better than a room of another. Considerable width was wanted to allow for the half-circles of children who formed into groups along the side walls; and some thought had to be given to the arrangement of windows and wall-spaces, that there might be places to hang the diagrams in and light to see them.

As the "monitor" system gradually died out, and the "pupil-teacher" system came in, an entirely different type of building suggested itself. The schoolroom grew longer and narrower; for the seats, instead of being placed in the centre and facing to one end, were now set along one side, looking to the opposite side. Three or more rows of long desks, divided by narrow alleys, came into fashion. The windows were generally behind them, so that the scholars' faces were in shadow, and the teachers had the light full in their eyes. At about this stage it began to be recognised that a classroom attached to the school was a valuable appendage. It generally opened out of the school, and some little disturbance inevitably occurred as the children entered or left it. Here, too, the windows were sometimes behind the desks, sometimes at the right of them, and sometimes on the left. The model plans issued by authority at this period exhibit all these varieties of lighting, and show the schoolroom sometimes dark at both ends and sometimes lighted. In one belief, however, everybody seems at this period to have agreed—namely, that the essential thing for an elementary school was one large schoolroom. The classes in it were thought to be sufficiently divided from each other by curtains.

From then till now the tendency has been to use more and more classrooms. Yet a room which will hold all, or most, of the pupils in each department is also wanted. An obvious resource was to divide the main school into classes by movable partitions, so that all could be thrown together easily, and could easily be sundered again. And this plan seemed good until the unpleasantness of lighting the desks from behind was fully recognised. Gradually it became a rule that classrooms should be lighted from one side of the children, not mainly from behind them, and still less from the front of them. A little later it was made an object to get this light from the left, because then, as every architect knows by daily experience, the shadow of the hand does not darken the slate or paper on which it is at work. But general schoolrooms are too long to be wholly arranged on this principle. The desks at one end may be lighted from the left, but not those at the other end, and not those in the middle. In this lies the weakness of the long schoolroom. It is still in favour here and there, but its days are apparently numbered.

Within the last 20 years schools have been built—and large and cleverly-designed schools, too—where the chief windows, in parts, are in front of the scholars as they sit at the desks. This is generally allowed to be the very worst direction for light. The teacher, with his back to a window, is only seen as a dark *silhouette;* and any objects or diagrams set before the class are almost invisible to them. They write in a glare, and the sunshine, when there is any, is reflected from their books into their eyes, so that in such a position they see nothing perfectly. This arrangement, then, being excluded, there remains, in a long schoolroom, a left-hand light to the desks at one end, a right-hand light to the desks at the other, and a back light to those between them. When the building is but one-story high, it might be possible to invent arrangements by which the classes had a left-hand light in every part of the long room. Something in the nature of transverse clerestories would effect this, though whether they would effect it satisfactorily may be doubted. Probably their windows would, necessarily, be too high up; and, if so, the scheme would be no improvement on the present ones. But where there are two or more floors, one above the other, nothing of this sort could even be attempted; and, on account of the expense of building land in towns, a multitude of schools have to be built with floor over floor.

The primitive school, and especially the rural school, did not lay itself out much for the comfort of its occupants. The entrance often had no porch, and the interior no fireplaces. Their absence was seldom complained of. There was a general feeling abroad that a school ought to be uncomfortable. Mr. Bumble, as we know, objected to "pompeying boys," and public opinion was on Mr. Bumble's side. Fathers remembered what they had gone through in their own childhood. The floggings, and the freezings, and the narrow forms without a back were the things which, as they believed, had "made men of them," and they wished to hand down these advantages, undiminished, to their posterity. The progress of luxury, however, went on in spite of protests. The schoolroom acquired a stove—a doubtful improvement, for those who stood near it were in a tropical temperature during working hours, and naturally took cold when they went away. Other modes of heating were tried in course of time—hot air, hot water and steam, as well as ordinary open fireplaces. Heating brought draughts, as it always tends to do, and how to get rid of these was the next question. There was no getting rid of them while staircases opened into schoolrooms, and schoolrooms opened into the external air. So lobbies and corridors were called for. The early staircases, again, were awkward and sometimes unsafe. They did fairly well for boys and girls, when there were not too many of them, but they were unpleasant for the local board or committee when they visited the establishment, and they were very literally a stumbling-block to that important personage, the Government Inspector. In large schools they were a real source of danger. A rush of several hundred children might take place, and then dark corners and unsuspected steps might mean broken limbs or instant death. So it has come about, in the course of years, that school staircases have developed into some of the safest staircases that are built—with wide treads, low risers, unbroken landings, good light, and division-walls instead of well-holes.

The schoolroom of 30 or 40 years back was surrounded in great part by hat-pegs. They took up wall-space which was wanted for other purposes, and even this was not the worst of them. In wet weather they were occupied by steaming rows of cloaks and coats, which added their own peculiar odour to the mixed scent of pomatum and fish-oil which then characterised a working-class school. The pomatum, of course, had been applied to the children's heads; the fish-oil was the favourite dressing for their boots, especially at rainy times; and the combination of the two was bad enough to bear, even without the vapours from slowly-drying clothes. But these, again, were amongst the things without which no working lad's education had been held complete. Outside cloak-rooms would have been thought an unpardonable piece of extravagance. They have come by degrees. Clothes-pegs were first removed to corridors and passages; then a piece of the passage was wholly devoted to them; and, finally, we have the number, the height, the distance apart, and the lighting worked out for everybody in the Education Department's rules.

As to ventilation, matters have hardly gone on so successfully. The present rules are good as regards the putting of windows near the ceiling, and as to getting cross-currents in summer time by open sashes or casements. But they advise "a separate air-chimney to each room, carried up in the same stack with the smoke flues." Why in the same stack? If it is for the sake of the warmth, then this warmth will fail when fires are given up for the year, and the ventilation will be imperilled in spring and autumn, when the air is too cold to allow of open windows. To put air-flues in a smoke-stack is to run the risk that smoke at times may come down them, and there is no obvious advantage to counterbalance this risk. It is true the rules say, and say rightly, that "an outlet should have motive power by heat or exhaust." But if it has this, there is no need to rely on such warmth as may come to it from contiguous flues; and motive power can be applied to air-shafts equally well, whether they are in a chimney or out of it.

The progress in sanitary arrangements need not be detailed here: it is part of the general progress in this subject made during the last half-century. Perhaps much special progress in this department may yet have to be made by schools in particular. The elementary school still tends to be a kind of circulating library of infantile diseases, distributing whooping-cough and measles, if not scarlet fever and diphtheria, to the surrounding neighbourhood. Some day it may be discovered how to prevent this. The school building will then have new arrangements or new appendages, and future times will look back on the buildings of to-day as we look back on those of our great-grandfathers. But this is a novel subject. It will first have to be dealt with, not by the architect, but by the physiologist or the microscopical explorer. In the mean time, the most conspicuous tendency in school arrangement is the tendency to multiply class-rooms and to give up long schoolrooms. The central hall is the feature of the day. No doubt it is a great convenience, but it is also a great expense. In these times, countries, like individuals, need more and more to think about cutting down expenses: and, from motives of economy, it may become necessary to cut down the central hall. As matters stand, however, the hall, with its consequent scheme of grouping, is looked upon as "the long result of time," the highest product of thought directed to school planning. It may be so. We may have reached a point beyond which improvement will be difficult, but it is a standing weakness of human nature in every age to think its latest improvements perfection, and its latest changes of opinion final.

ARCHITECTURAL STUDENTS.

THERE are two kinds of architectural students: those who desire to attain to the position of "architect," or to tack "F.R.I.B.A." after their name with as little preparation and delay as possible; and those who wish to make the necessary knowledge their own, and to become masters of the art. To the former the desire to be called and thought of as "an architect" is the chief impulse; to the latter the professional achievement is nothing compared with the real aim and objects of architecture. It is needless to say which is the right and true motive. Our Correspondence column very frequently and fairly gauges the objects and ambitions of students and would-be architects and engineers. A very common kind of question put to us is, "What is necessary to take the title of an architect or a civil engineer?" Or, "What is necessary to entitle me to call myself 'architect' or 'C.E.'?" A week or two since a question of the latter kind was asked in our "Intercommunication" Column, and they are repeatedly occurring. In the rush to enter a profession, not so much from any natural liking or aptitude for it, as from the necessity of making a choice or a living, a large number of young men proceed from this motive. Parents urge their sons to make up their minds, and the first idea of the young man is to enter into the profession as soon as possible. Others who have been fulfilling the duties of assistants, and who have learnt something of building routine, are often anxious to make a start on their own account, and if they can get any initials attached to their names they are satisfied. The ambition is very natural and very praiseworthy, though in a large number of cases their mistake of the vocation is soon realised. What to study? What books to read? are the too plain indications that these students are helplessly at sea, and have not comprehended the real bearing of their calling. They drift about from pillar to post aimlessly, catching at one thing, then at another, without any purpose or object. Drawing has occupied their attention during office or leisure hours; they have, perhaps, copied specifications, and tried their hands at details or quantities; all the while they have failed to perceive their proper course, or the real object of architecture. Between "squaring" dimensions, tinting plans and elevations, copying specifications, the youthful pupil is in a perfect "fog" as to what the architect is expected to know. These things are so apparently disconnected and singularly out of "gear" in the mind of the tiro, that he cannot exactly see where he is. We cannot wonder at the query put by a correspondent to us the other day, "Whether it is absolutely necessary that I should be articled?" or whether the profession cannot be learned by books and "coaching"? To many, office work is mere drudgery, beyond which they see little that is encouraging; to more intellectual youths in connection with day and evening classes, such as those of King's College or the Architectural Association, it is a preparatory training of much value. The desire for a "royal road" to the profession is just now a prevailing one, and there are hundreds of students who would rather go by the shortest road—if any were open to them—than submit to a five years' pupilage. The age in which we live is for "short cuts"; even literature is beginning to be fragmentary and scrappy, till we fear in a few decades from now real classical authors will seldom be read. It is the same with everything. The "coach" and the cramming system supply the place of pupilage and the college course; everything is learned in a pick-and-choose sort of way, much to the deterioration of the professional man. Upon educationists is the responsibility laid, and it is for them to try and stem the prevailing habits. In the medical, legal, and architectural professions we hear the same cry, "Full to repletion; keep back the crowd. Make entrance more difficult." In the two first we know, as a fact, the qualifications have been increased and the examinations made stiffer. The effect of this is to increase the tendency to "cram," to invent methods of overcoming a long course of study. It will also, we fear, do another thing: it will make pupils anxious of evading articleship, for they will naturally think, if they have to go through a course of study and lectures before they can pass, they might as well reserve their study and money by not entering an office. Hence the very natural question that has been put to us of late by more than one student, "If it is absolutely essential to be articled?" If they can go through a course of instruction at King's, University College, at the City of London College, or elsewhere, and obtain all that is necessary to pass an Institute exam., why should they spend three or five years in an architect's office, and pay a heavy premium? Such is the course of reasoning adopted by a great many who wish to enter the profession.

The perfunctory way of making an architect is also observed in the method of study. Let us take, for example, the class of young men who wish to be admitted in the easiest manner and by the quickest road, but who have no real idea of the aim and responsibilities of the vocation. We find them asking such questions as to the kind of books to read, as if any quantity of reading will make them qualified architects. The candidate that has benefited by reading is one who knows something of the practical every-day work of the architect, who has set his mind over plans and sections, has seen a little of actual building and has sketched old work. These men seldom ask such silly questions as which is the best book to learn Gothic or Renaissance architecture and details, for they know that the best instruction is gained by observation and careful sketching of details, and that the most the textbooks supply is the names and dates of examples and their cursory characteristics.

The tiro who enters a technical or architectural school straight from his home or his college is without any idea of building, and takes to his lectures and his books very much as a boy enters an office. It is all foreign to him. After a few months' instruction he is still a long way from understanding the duties of an architect's calling—how to prepare a design or write a specification. And why? Simply because the office and the workshop are still strangers to him. He may have made technical drawings of brickwork, of carpentry and joinery, of masonry, of iron roofs and floors in the same perfunctory fashion as he learned to copy his writing-lesson at school.

Book work and practical work are two of the relative factors in the student's life; but for some reason or other they are generally divorced. Many a student thinks he can learn everything from books. The recent remarks of a medical authority to students in that profession are applicable to the architectural student. The elementary textbook ought to be used as the skeleton of his knowledge; the student ought to endow it with tissues and life from his own personal observation, by practical school courses and visits to buildings. A mere dry study of textbooks is of little value, except to furnish the mind with names and definitions, and yet the ordinary student regards the textbooks in the light of something to be read through, and committed to memory as quickly as possible. No wonder the pupil undervalues the textbook, and looks upon it much in the same manner as the schoolboy does his Murray or his Eton Latin Grammar. They are looked upon as "dry-as-dust" manuals, and the more elementary they are the more difficult they are to grasp or comprehend. Instead of being used as a "skeleton of knowledge," which they simply are, to be clothed by his own experience, the student cannot see any use or value in them, as they do not supply his needs. But the student of a practical order of mind, who has served his time in an office, can utilise the elementary textbook; he reads into it his own experience, and he begins to read it with some interest. A good advice given by an eminent physician to his class is to write his own textbook by grafting his practical work on to an elementary manual, and to revise his knowledge before entering for an examination by the light of a first-class textbook. Every student can do this; if he has any love for his work at all, he will take an interest in filling up the outlines and dates of a manual on styles with his own notes and sketches, and his scientific textbooks with remarks of his own derived from practical knowledge, or from other authors. The Institute rightly insists on the necessity of making reading thorough by supplementing it by the taking of notes and sketches, and by information under various heads from different authorities. The continuous use of a notebook is enjoined on the student, in which he should write down, in his own words, the principal parts of the books under study, and also supplement these notes by sketches from all available sources (notes on one page, sketches on the opposite page). The accurate sketching of old work in plan, elevation, construction, and detail from memory is equally valuable, thus bringing eye, brain, and hand into exercise. In this way the student can be made to enter into the spirit of the art. The note and sketchbook are the only true tests of the student's knowledge; they serve to indicate the extent of the knowledge he has made his own from lectures and reading and observation, and serve to mark him off from those who pursue the course-and-cram system, and desire to become architects in name only. We are inclined to think, despite the advice of teachers at official head-quarters, that the "course-and-cram" system is now most in favour amongst young men who desire to assume the *rôle* of architect or engineer. Like the clinical work of the medical student in the hospital wards, the practical work on buildings must go hand in hand with books and lectures.

Perhaps there is another distinction between the two aspirants we have been considering, and one that lies deeper than methods of study. The novice who is in such a hurry to take the name of architect is often a more receptive man than he who is in earnest to prove his qualifications and credentials. He learns by rote quickly, has a capital memory, and, with the help of a little "coaching," is sure to pass any examination. It has been pointed out by all authorities on teaching that the receptive man quickly learns and benefits by teaching, which only arouses opposition in the critical man, and this explains the reason why so many of those who have passed examinations with credit frequently fail to exhibit any talent in actual practice. In every profession there are examples of this fact; but in architecture we find designers of very feeble buildings able to go through their examination with conspicuous credit. Between the critical faculty necessary to select good forms and to arrange plans upon logical data, and the mere receptive ability to collect facts and work out formulæ, a great gulf is fixed. The one order is perceptive—it can discriminate between good and bad, can think out a problem of design, while the other can only gather and grope its way between conflicting opinions. The first can invent, the other only collect and classify; hence we find that copies and poor compilations of existing buildings are the rule rather than the exception.

REPAIRS TO BUILDINGS.

THE periodical repair of buildings is one of those matters which are intrusted largely to the trades. The architect is sometimes called in to prepare specifications of what is necessary to be done, and these relate mainly to structural repairs as well as to those of a superficial character, like painting and decoration. The subject is one dearer to the surveyor than to the architect in its quasi-legal aspect, and every provincial practitioner whose practice is of a general character must have at one time or another have been called upon to draw out specifications for repair of premises, and to define what a dilapidation really is. Lawyers have invested the question of dilapidations with a degree of verbal obscurity which has to be mastered before anyone can presume to say what a dilapidation is. Between accident and wear there is a distinction to be drawn; fair wear without accident is declared to be not a dilapidation, so that if one sees a very worn staircase with its treads and nosings nearly worn down to a fine edge in front, it cannot be called a dilapidation, whereas if there is any "degree of accident" it is one, as, for instance, if the "nosing" of any step is broken, it is taken as a dilapidation. In all cases "reasonable wear" is excepted in the covenants of a lease, though how the word reasonable is to be taken is not very obvious. Repairs also are "substantial" which relate to structural parts like walls, floors, and roofs, and "tenantable" such as fittings or fixtures, windows, doors, ironmongery, plastering, painting, papering, &c. Of course, in every case the dilapidations are more strictly defined by the covenants and conditions. There are a great many things which the tenant or lessee is supposed to do under a lease, which few ordinary people who take houses know anything about. Neglect of repair in time to save any part of the premises is justly visited on the tenant; thus, if a tenant neglect to repair any slating, tiling, or roofing, and by his default the plastering or papering or woodwork internally is injured, he is responsible. Also, if he neglects to replace a rotten joist by which the floor sinks and is damaged, he is in like manner responsible. But if the roof gradually gets impaired, so long as it is weatherproof it is not a dilapidation; and if the beam or joist, though decayed, still supports the floor, he is, in the same manner, exempted from repair. And it is the same with other things like painting; if any decay arises owing to the neglect of painting, it is a dilapidation. The common phrase, "wear and tear excepted," therefore, must be taken with certain limitations; for wear and tear may pass beyond the limits of moderation and become positive neglect, so that the premises begin to suffer thereby. The architect or surveyor will always have some nice distinction to draw in asserting whether such-and-such a fitting or covering has gone beyond wear and tear. Very ambiguous are the terms under which he has sometimes to act. The liabilities of tenants have been over and over again brought before the Courts, and are so largely dependent on the stipulations that it is almost impossible to lay down any general rules. Where no stipulations exist, or where no covenants are inserted in the lease, the law still holds the tenant liable for the common covenants to "repair, maintain, and uphold." The contract is implied not to commit waste, but exercise "reasonable care, and use premises in a tenant-like manner." Elmes, in his work on "Dilapidations," an able authority, very fairly interprets the mind of the law in his day when he says it is so notoriously the duty of the actual occupier to "repair, sustain, maintain, and uphold the premises, and so little the duty of the landlord, that even without an agreement or covenant to that effect, the landlord may maintain an action against his tenant for neglecting such duty on the ground of the injury done to his inheritance." The Courts now are a little less exacting on the tenant where there is no express contract to repair, and it may be affirmed that under such circumstances the tenant will only be held liable for those accidental dilapidations which we have before indicated. The obligations of tenants under leases are certainly not understood as they ought to be. In his own interest a tenant ought to be sure that he does not make himself liable for the neglect or waste of his predecessor, and he can do this only by employing a competent architect or surveyor to find out whether the premises are in fit and proper repair, or ascertain at least their real condition, so that at the determination of the lease any dilapidations or neglect may be ascertained, and any disagreement avoided. How many a helpless lessee has been subjected to an action for dilapidations due to neglect of a former tenant!

There appears to be much uncertainty about the usual phrase of "good, tenantable repair." In a recent case tried in the Court of Appeal, "Proudfoot *v.* Hart," Justice Cave said that "tenantable repair" extends to commissive and to permissive waste, and "that a tenant must not only make good the damage going beyond mere ordinary wear, which is done by himself and his family and servants, but that he must also make good the damage which is done by other causes, such, for instance, as a casual storm which takes off a slate from the roof, or a stone thrown from the outside which breaks a window." If the tenant neglects to do these things, and the result is that further damage is caused to the structure, then he must make good that damage also, because it comes of his not performing his covenant to do tenantable repairs.

Papering and painting are considerable items in most tenancies. The same judge laid it down, as to papering walls, that a tenant was not obliged to put new paper on the walls simply because the old paper had become worn out—a dictum which is perfectly reasonable. However, we know that repairs required by lessors under this covenant generally include repapering. Again, with respect to painting woodwork, the tenant is generally required to repaint throughout; but according to the decision in this case, he is not bound to do so where it is only required for the purpose of decoration. Woodwork that is simply painted when he enters the house, and the paint wears off during his tenancy, causing injury to the woodwork, he is liable to repaint on the ground of permissive waste; but if no damage is done to the woodwork he is not liable, for such wearing-off simply would come under the designation of "wear." And the same rule is applied to whitewashing ceilings which may become black during the course of the tenancy. The same decision applies to walls, floors, doors, and windows. Generally it is held the tenant is bound where there is a breakage; but he is not bound when a portion of the structure has become absolutely worn out and necessary to be replaced. He undertakes simply to patch the work up so long as it is right and reasonable that it should be patched up, but no longer. When it can be patched up no longer, the tenant is not bound to put in anything new, or to pay any proportion of the cost of putting in the new thing. The decision which we have cited was contrary to that which the official referee had given, and we do not hesitate to say that it is contrary to the view held by many eminent surveyors.

From what we have said, there is little question that the law takes a less stringent view of the lessee's obligations than it was wont to do when Elmes wrote his book. We remember several instances in which the tenant, under his lease, has been called upon to reinstate portions of the structure, like decayed floors and roofs, and where damages have been awarded to the lessor in respect of cost incurred by him in repapering walls, repainting the internal woodwork, whitewashing, &c., where the paper, paint, and whitewash had been simply worn out during the tenancy. Unless this natural wear can be shown to have resulted in the permissive waste of the fabric, the law is clearly as the decision above given points out.

FILTRATION.*

As the country increases in population, and the drainage areas of many of the streams and other sources of supply are gradually utilised for the habitations of mankind, the question of obtaining a water supply free from disease producing germs and other objectionable matter, vegetable, animal, or mineral, is of increasing importance, particularly in the densely populated districts of the Eastern and Central States. When it is possible to obtain an artesian supply, virtually free from animal matter, it is a fortunate circumstance. The removal of such slight vegetable and animal growths as may from time to time occur is an easy matter. But many "ground-water supplies" from shallow, open, or driven wells are little better than those from contaminated streams. When a place is so situated that it must depend for its water supply on drainage, and dotted with farmhouses, barns, stables, &c., with here and there a village or hamlet, the only absolutely safe way for the town or village to remedy the evil is to purchase the entire watershed and allow nothing to live on it. This will eliminate most disease-producing germs, and subsequent filtration will remove nearly all the objectionable matter, organic or otherwise. It is quite true that at present there are many places where the supply is not subject to such contamination, but will they remain so for a reasonable time? As the expense of purchasing an entire watershed would bankrupt almost any place, it must accept the contamination as an unavoidable and permanent condition, and, like such cities as have an impure ground-water supply, they should provide for as perfect purification as is possible for a reasonable though perhaps great expenditure of money. If I am correctly informed, filter galleries were used in India 600 years ago, and it is a well-known fact that the Egyptians and the Orientals placed aluminous rocks in their water-jars in order to remove the impurities; that in England, France, Germany, and other countries, sand filters in one form or another have been, and are now being, used with more or less success; that the proper application of metallic iron at Antwerp and other places has increased the efficiency of the filter, and many of the old filters used in New England for clarifying the water for manufacturing purposes embodied many of the principles now recognised, and alum, iron, and other chemicals were used. A rotary air agitator in place of an air-pump was used in connection with alum in the year 1846 at Norwalk, Conn., by a hat manufacturer, but the use of alum was soon discontinued on account of its bad effect on fine colours. The numerous pressure and gravity filters of the present day, which may not or may use coagulants or precipitants, and the many natural and artificial filter-beds and those that depend upon chemical change of the matter in the water, are not the product of the chemist or biologist, but the results of the combined efforts of each, perfected mechanically by the engineer. Each one has its merits. In some cases one will do what the other will not. In other instances either would do. In the latter event first cost, running expenses, and cost of maintenance should determine which is best to use. It hardly seems necessary to refer to filters using sponges, charcoal, or coke breeze, either alone or combined as a filtering medium. While with proper attention they have done good work, the voids become filled up with sediment, and any sudden change in the velocity of the water tends to drive this matter through the filtering medium, to the great detriment of the filtrate. Such filters need most careful attention, or better yet, should not be used at all. It would seem as if coke filters should have merit, for with proper attention they effect a decided reduction in the amount of organic matter in the water. It is thought its action depends upon the metallic iron present. When the coke has been fully used as a filtering medium, it can be dried in a few hours and used as fuel. In many filters using a silicious medium for a filtrant, the water is first treated with a precipitant or coagulant.

On account of its cheapness and efficiency alum is given the preference. If just enough of this could be used to coagulate the foreign matter, there would be no better way of reducing the impurities in the water to a form in which they are readily retained by the filter. Unfortunately no one has yet found a way of adding just the right amount at all times, as the impurities are constantly varying in quantity. The amount of alum sufficient for one week may be largely in excess the next. As is sometimes the case, the filtrate contains 12, 14, and even more grains of alum per gallon. A small amount of this will kill a fish, and less than one ounce has been known to kill an adult human being. Its use in bread-making was prohibited by law in England years ago, as it was conclusively proven that its use, even in small quantities, is conducive to severe derangement of the digestive organs. It is not the object of this paper to discuss the merits and demerits of any of the filters on the market, as the representation of the different companies here present are better able to do so. If an occasional statement should seem prejudicial, it is not intended as an adverse criticism. While several failures have occurred, many of the filters are doing good work, and each year shows a marked advance in the elimination of disease-producing germs. The same is true of filter beds, and after a partial failure at Berlin and other places, to America belongs the credit of having demonstrated that by proper filtration through sand, without the aid of chemicals, typhoid fever and other disease-producing germs can all be eliminated from drinking water for a reasonable cost. Filter beds in this country seem to have few friends and many enemies, but after considerable experience with them I am forced to believe that they not only have merit, but are deserving of as much consideration as any one of the pressure or gravity filters. In many cases a plain dyke of sand and gravel has answered the purpose. At Waterville, N.Y., population 1,500, the water at times is highly charged with vegetable matter and much clay in suspension. After passing through a dyke it is made perfectly clear and wholesome, and never, to the best of my knowledge, has any fault been found with the water in town. The dyke cost 1,500dol., and has been in operation since 1888. The cost to clean it has been about 20dol. per year, which, added to the interest on the investment, would make the total cost 80dol. per year, or $5\frac{1}{3}$ cents per capita. At Bethel, Conn., population 2,500, the water was highly contaminated with vegetable and animal matter. Its odour was very offensive; in fact, the supply was so bad that it could not be used for drinking purposes, or in the manufacture of hats, which is the largest industry at Bethel. Something had to be done, but bearing in mind the injurious effects of alum on fine colours it was decided to employ some method not involving the use of chemicals. Accordingly there was designed for them a simple filter properly underdrained, with a submerged well in one corner. The gates were so arranged that water could be drawn down to the bottom of the filter bed and the air allowed to circulate through it; thus one filter bed was made to possess all the advantages of intermittent filtration, and, in addition to the advantages of nitrification, thus gained the action of the sun in drying up the sediment on top of the bed, saved much work in scraping the surface, for after a few hours' exposure the sediment peeled up and dried, and upon refilling with water it floated ashore. It was calculated to, and does, filter 300,000 gallons per day at the rate of 5 gallons per square foot per hour, or 5,227,200 gallons per acre per day. The total cost of the improvements, including a long dam for increased storage capacity, was about 6,000dol., but only 300dol. can be charged as the cost for filter. The cost to operate, including removal of sand, is 50dol. per year, which, added to interest on investment, makes 170dol. per year, or $6\frac{8}{10}$ cents per capita. Analysis shows that over 94 per cent. of the organic matter is removed by filtration. The lowest estimate we had for a filter using alum was, first cost, 3,200dol., and the running expenses estimated at 1·85dol. per day, of which 60 cents was for alum and 1·25dol. was for attendant. It will be seen that this added to the interest on investment would have made a total of 803·25dol. per annum, therefore the Bethel has saved each year since 1890 633·25dol., or over 25 per cent. per capita per annum, in using the filter-bed instead of the cheapest mechanical filter offered. At Nantucket, Mass., in 1892, a filter-bed, similar in principle to that of Bethel with minor conditions, was constructed. The water supply here is taken from a pond with no visible inlet or outlet, and the water seems to percolate into it from the sandy territory surrounding it. About every other year they are troubled with vegetable growth for about three months, generally in August, September, and October. The analysis given in the table printed herewith will show the purification effected when the trouble was greatest—viz., on August 14, 1893. It will be noticed from the analysis, first, that 68 per cent. of the organic matter as presented by the albuminoid ammonia was removed; that 13 out of 16 genera present were filtered out; that crenothrix and anabaena spores were absent in the filtered water, while out of a total of 216,000 anabaena per 100 cubic centimètres, but 3,600 remained, or $98\frac{1}{3}$ per cent. were removed. The iron was reduced eleven-twelfths, but this is probably because the organisms removed contained much iron, though aëration no doubt had considerable effect. If we except September 22, when, for some unaccountable reason, the organisms, if the analyst did not make a mistake, remaining in the filtered water were the same as in the unfiltered, an average of 96 per cent. of the micro-organisms were removed during the season of three months. The average amount of organic matter removed as represented by the albuminoid ammonia was 65 per cent. One strange thing at Nantucket was that occasionally an odour could be noticed in the filter water. It was observed, however, that as the aëration was increased and the temperature reduced, it became much fainter. It is the intention to carry out the original plans to the letter this season, and, first, to construct a submerged well, so that the filtered water can be protected from heat and light; and second, to cover the stand-pipe so that it will be light-proof; and third, to take the air from an adjacent ice-house, instead of from the hot engine-room, as at present. The total cost of the plant was 4,500dol., and it cost 90dol. per annum to operate. The sand used would pass 40,000,000 gallons per day through 1ft. under 1ft. head. At Lawrence, Mass., a filter bed $2\frac{1}{2}$ acres in area is in successful operation. In its design the engineer has shown considerable ingenuity and considerable study. It is designed to filter at the rate of 2,000,000 gallons per acre per day. The finest sand used will allow 50,000,000 gallons per

* Paper read before the Minneapolis convention of the American Waterworks Association by James B. Rider, of New York.

acre to pass through 1ft. of it under 1ft. head. It has successfully removed, when working at above rate, $98\frac{33}{100}$ per cent. of all bacteria, and though it has been in operation only since Sept. 20, 1893, the marked decrease in deaths from typhoid fever from a total of 43 for eight months in past years to 17 for the present, shows how near perfect the filter must operate, especially when it has been shown that nine out of the 17 that died had frequently drank of the unfiltered water. The death-rate from typhoid fever was in reality, therefore, reduced nearly 82 per cent., while the organic matters, as represented by the albuminoid ammonia, of which 15 or 20 per cent. is in suspension, was reduced 45 per cent. It cost about 75,000dol., but had other than home labour at 2dol. per day been employed in construction, its cost would not have exceeded 50,000dol. The cost for maintenance, as estimated by the superintendent, Mr. Salsbury, is as follows: Interest on 75,000 dollars at 4 per cent., 3,000dol.; cost for cleaning bed and replacing sand, 3,000dol.; total, 6,000 dollars, or 12 cents per capita per annum. The superintendent states that, to provide for a 7,000,000-gallon mechanical filtration plant, a filter company wanted about 60,000dol.; but assuming they could get one at the low price of a 5,000,000-gallon plant for 30,000dol., the interest on this sum would be 1,200dol. per annum, which, added to the cost for coagulant and attention, to say nothing of the water necessary for cleansing a 5,000,000 battery, would certainly make the cost for running a mechanical filter plant at Lawrence as much as it now costs the city. The above facts have been cited not for the purpose of showing that the filter beds are in all cases cheaper than mechanical plants, for they are not. And again, many are the conditions where a mechanical filter could be used and a filter bed could not. One thing is certain, that to-day many filter-beds in America are giving far better results than the old ones of Europe; also that a filter-bed properly cared for, as at Lawrence, Nantucket, Bethel, and other places, ceases to act entirely as a strainer; but by the admission of air, by the drawing down of the water to beneath the bed, chemical action takes place, and as Mr. Mills says in his report on the Lawrence filter: "There is nearly air enough in our drinking water to supply the oxygen which is necessary to carry on the process of nitrification when the water comes in contact with the grains of sand which have nitrifying bacteria adherent; but the condition of the air which enters the sand by drawing the water out of it once a day caused a more complete burning up of organic matter in the water, which is the nitrifying process spoken of. The question may arise: If water contains so much air, why does not nitrification take place in a reservoir? The reason is that nitrification will not take place unless the water with the air comes in contact with certain bacteria, which in some unknown way cause the process to be carried on. These bacteria attach themselves to the grains of sand of the filter, and remain there, and when air is present they can in a short time cause the nitrifying process to be carried on so completely that nearly all the organic matter in the water is burnt up, and with this burning the disease germs in the water are killed." Recent investigation has proven beyond question that where a filter bed is not forced to filter beyond more than, say, 8,000,000 to 10,000,000 gallons per acre per day, that most micro-organisms are retained in the upper portion of the bed and do not pass down into it. It has been demonstrated that the cost of cleansing is not great, and that the cost of construction under favourable conditions is not greater than that of a mechanical plant, and frequently it is less. In short, all that has been said against filter beds and mechanical filters is not true. Both have done good work, and ofttimes poor, but to-day there is no excuse for having a poor filtrate from either. In relation to mechanical filters using a silicious medium, one thing is certain: that is, that such of them as use a proper coagulant and precipitant can with safety filter at a more rapid rate than those which do not, and if the filter companies will insist on having plants large enough, no matter if the cost is increased to the user, it would be seldom that the chemist could find more than a trace of the coagulant or precipitant in the filtered water. The great efficiency of filter beds and mechanical filters has been so thoroughly demonstrated by experience, that there is no excuse for any community to longer use unfiltered water. After an experience with 40 waterworks, the writer and his father have decided not to build another without a proper filtration plant. No matter how careful an engineer may be, if the water is bad at any time, he is blamed for it. Very few supplies are such that they cannot be improved by proper filtration. Again, you do not know even with good water what day you will be troubled with "purging." At Chester, N.Y., "purging" never occurred at Walton Lake until the first year it was used as a source of supply. At Norwalk, Conn., they have two reservoirs a quarter mile apart. In the upper one purging never took place until last season, while in the lower one, with the same water, it occurred annually until last year. At Orange, N.J., as in many places with new reservoirs for the first few years, they had the same trouble, but of late they have not been annoyed. From a business standpoint, filtration is necessary from the first day water is introduced. A system of waterworks must have friends and consumers or it cannot live, but a people cannot be expected to discard their wells and cisterns for a contaminated or objectionable supply. In several small places where waterworks have been constructed, if nearly everyone was not a water taker the works would be a financial failure. In conclusion, while the arguments would to a certain extent commit the writer to filter beds, let it be fully understood that such is not the case, and as proof of this will say that, with two plants that he now has under construction, in one case is providing for a filter bed, and in the other a mechanical plant. Above all there is in this life for a man is contentment; without health this is impossible, and no community can be healthy while drinking bad water.

DESIGNING OF STEEL BRIDGES, THEORETICAL AND PRACTICAL.—VIII.

THERE are a few points in which the difference between the designing and construction of steel and iron bridges is so marked that attention must be drawn to them. They concern the quality of steel used for different parts of the same structure, and have an especial reference to riveting, which we shall point out in its proper place. In the case of ordinary iron girders, trusses, and bridges, it is a common practice to specify one description of cast or wrought iron for all the parts of the design, with the exception of the bolts and rivets. In steel bridge girders and roof trusses, this licence is not permitted. According to the position of the various members of a compound or built-up girder, and the amount, as well as the nature, of the stresses to which they are subjected, so must the quality of the steel employed possess special powers of resistance. When the great cantilever or continuous girder railway bridge was built over the Mississippi at Memphis some two or three years ago, three descriptions of steel were required in the specification. A high-grade steel was demanded for the booms, chords, and all the principal members of the trusses; a medium quality for the longitudinal, cross and other platform girders, and transverse and diagonal bracing, and a soft steel for only the rivets. The following table gives the strength in English tons and decimals, and some other particulars of the different qualities of steel employed in the Memphis bridge:—

TABLE I.

Description.	High Grade.	Medium.	Soft.
Maximum ultimate strength	35·04	32·36	28·12
Mimimum ultimate strength	30·80	28·57	24·55
Minimum elastic limit	17·85	16·52	13·40
	per cent.	per cent.	per cent.
Maximum elongation in 8in.	18	22	28
Minimum contraction	38	44	50

It should be observed with reference to the above Table I., that whereas the differences between the ultimate strength and elastic limits of soft and medium steel is approximately double that existing between the medium and the high-grade qualities, the minimum elongation and contraction do not follow the same law, but approach a great deal nearer a constant difference.

It is clear, therefore, so far as regards simply the ultimate tensile strength of the material, the harder it is the better. It must be borne in mind one of the principal reasons for employing steel in preference to iron in constructive works, is that it admits of a higher unit stress being imposed upon it. Consequently less material is required, which means less weight, or, more correctly speaking, a less proportion of dead or useless weight between the structure itself and the load it has to carry. Such being the case, it may be fairly asked, Why not almost use steel of a medium or high grade, as in Table I.?—and so secure at once the highest unit stress and the greatest amount of economy at one and the same time?

This is just the point respecting which engineers and architects are not altogether *d'accord.* Some consider it undesirable to specify for too high a tensile resistance in the steel employed for bridges and roofs, and instance the fact that cracks and other mysterious defects make their appearance in steel of this high-grade quality, from which the milder specimens are altogether exempt. Without taking into consideration the highest quality of the material, very satisfactory, trustworthy, and excellent results are obtained with a steel possessing a tensile strength of from 26 to 30 tons per square inch of sectional area. If we take the average of these two values, call it T, put F equal to the factor of safety, and S for the safe-working stress per square inch, to which the material is to be subjected, we shall always have—

$$S = \frac{T}{F}.$$

In Germany, very mild steels, possessing correspondingly low tensile powers of resistance, are used in the construction of boilers, in shipbuilding and metallic structures generally, on the plea that the milder steel is more trustworthy. This statement is, to a certain extent true; but if engineers are to adopt, for the sake of alleged greater reliability, a quality of steel which is endowed with a gradually decreasing tensile strength in proportion to its mildness, they will very speedily find that there is no economy in using that material at all. They had better go back to good wrought iron, which can still be obtained always well up to the old stereotyped Board of Trade working stress of five tons per square inch. It is just possible that the reason the German engineers not only advocate the use of these low steels, but, it must be admitted, act up in practice to their own recommendation, is that they are obliged to employ this quality, as they are either unable to turn out a higher class of steel which is trustworthy, or when they do, the cost is far too high to allow of its employment in ordinary constructive works. This supposition derives some support from the fact that steel of a higher tensile strength is made in Germany, but only under especial conditions, when it is expressly sought for, and the parties requiring it are not obliged to cut down the estimate too low. At the same time, it should be mentioned that there is equally a limit in the other direction, and that it is quite possible to have steel of too high, as well as of too low, a grade. A quality of material which would serve admirably for the manufacture of tools with sharp cutting edges would make but a very poor specimen of a rivet.

Before drawing the attention of our readers to the practical part of steel riveting, and those points in which it differs from wrought-iron riveting, we will proceed to the theoretical analysis of the joint for the flange-plates of the main girder of the bridge under design. There are three plates in each flange, but it is only necessary to consider the heaviest of them, which is $\frac{1}{2}$in. in thickness, against $\frac{3}{8}$in. for the same dimension of the other. It has been already stated that although there is a difference in the net sectional area of the two flanges, insomuch as the upper has three plates each $\frac{1}{2}$in. in thickness, while in the lower flange one of these is only $\frac{3}{8}$in. thick, no distinction will be made in the number of rivets required, or in the length of the covering-plates or wrappers, and the question of the effect of the holes upon the compression boom will be disregarded. Let A = the gross area of one of the flange-plates either at top or bottom, and let A_1 = the net area of the same plate. Put U to represent the unit stress—that is, the working stress per square inch of the net sectional area of the lower flange, or the one under a tensile stress, and let U_1 equal the same stress for the rivets. Make N equal the number of rivets required on each side of the joint, put *d* for the diameter of the rivets, and π for its universal value, then we have—

$$A_1 \times U = N \times U_1 \times \frac{\pi d^2}{4}$$

which gives the value of N, the number sought.

$$N = \frac{A_1 \times U \times 4}{U_1 \times \pi d^2} \quad \ldots\ldots\ldots\ldots \quad (1)$$

But if *b* and *t* = breadth and thickness respectively of the plate, then $A = b \times t$, and $A_1 = (b - nd)\,t$, the symbol *n* representing the number of rivet-holes in the same line of fracture in the cross-section of the plate, so that we may write—

$$N = \frac{(b - nd)\,t \times U \times 4}{U_1 \times \pi d^2} \quad \ldots\ldots\ldots \quad (2)$$

From the nature of the example, we find—

$$A_1 = (b - nd)\,t = (18 - 3 \times \tfrac{3}{4})\,\tfrac{1}{2}.$$

In the accompanying Figs. 11, 12, and 13, it will be seen that the absolute theoretical value for *n* is 2, taken through the line of fracture A – B; but is equal to 3 along the line CD, although one of the rivets does not really belong to the joint. For reasons already laid down, it is preferable to put it equal to 3, as there is then a margin allowed for the insertion of an odd rivet here and there, the exact position of which cannot be determined with complete accuracy until the structure is actually erected. There is in every bridge and roof a certain amount of external work to be done; brackets, lamp-fixings, gas-pipes, gutters, facia, and ballast boards, parapets, and very frequently accessories of an ornamental character in architectural designs, which must be fixed on to the main framing. In fact, there is nothing else solid enough to attach them to. It therefore nearly universally occurs that holes must be punched or drilled wherever they are needed, and whether they deduct one or more diameters from the original value of the gross sectional area A is a matter which is completely disregarded. It is, therefore, well not to put the value of *n* too small.

FIG 11.

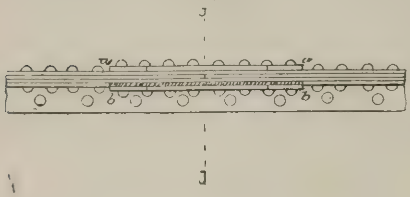

FIG. 12.

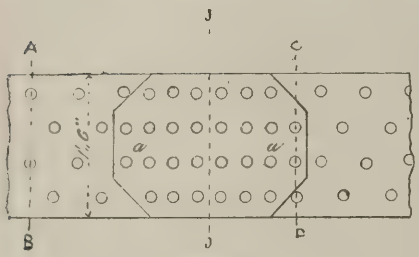

FIG. 13.

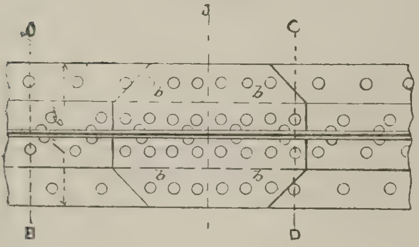

Returning now to our equation "2," and substituting the actual numerical equivalents for the algebraical quantities, we have the following:—

$$A_1 = \frac{(72 - 9)}{8} = 7{\cdot}87\text{sq.in.}$$

and also—

$$\pi a^2 = 3{\cdot}1416 \times 0{\cdot}5625 = 1{\cdot}7715.$$

Inserting these values in equation 1, we obtain, bearing in mind, that, from previous articles, U = 7, and $U_1 = 5$—

$$N = \frac{7{\cdot}87 \times 4 \times 7}{5 \times 1{\cdot}77} = 25 \text{ rivets.}$$

This number would be required, supposing the rivets were all in single shear; but they are evidently, so far as the jointed plate is concerned, in double shear, Figs. 11-13. Here we have a practical and noticeable difference between steel and iron riveting. In the latter the unit shearing stress of rivets in double shear is not twice the amount of that which obtains when they are only in single shear; but the correct ratio is 1·75 to 1. In the case of steel rivets the proportion is 2 to 1, so that in the joint in question 13 rivets will be sufficient, which can be obtained by the arrangement shown in the cuts, in which the pitch of the rivets is 3in. or one-half that of the regularly continuous pitch of the rivets uniting the plates, angle-irons, and web of the girder itself.

The joint J J is practically built up as follows:—One outer cover-plate or wrapper, *a a*, of the shape shown in the elevation in Fig. 11 and in plan in Fig. 12, and of a thickness of ⅜in. As there are plates of this thickness in the lower flange of the girder, short pieces can be readily supplied for the purpose, or otherwise they would have been made ½in. thick, the same as the plate they are intended to cover. The joint line J J runs between pairs of rivets that are ¾in. in diameter, which allows of a distance between the joint and the edge of the nearest rivet-holes of 1⅛in., or a diameter and a half, thus leaving quite margin enough. On the inner side of the joint, Fig. 13, a pair of wrappers, *b b*, each of which are about one-half of the outer wrapper in shape and size, are riveted over the flange-plates and angle-irons, and packing pieces, shown by hatched lines in Fig. 11, are placed between the wrappers and the flange-plates to give the former a flush bearing over the whole joint. Instead of this arrangement, the inside cover-plates are sometimes bent and cranked over the horizontal flange angle-irons, and in other instances the angle-irons are not covered; but the strips over the inside part of the plates are the only inside wrappers used. If the last-mentioned method be adopted, then the thickness of the outside wrapper and of the inside covering strips should not be less than that of the plate they joint. A glance at Fig. 13 will point out that if strips are used which cover the plates only, the angle-irons have to perform the duty of inside wrappers for a large portion of the joint, and therefore the thickness and consequently the sectional area of both outside cover plates, *a a*, Figs. 11 and 12, and also of inside strips, *b b*, must, when united, be sufficient to relieve the angle-irons of all stress on the supposition that the joint might fail by want of strength in the covers, inside and outside.

In the actual process of riveting up a steel bridge, the rivets, if of that material, cannot be heated to the intense heat to which iron can be subjected; but when they are to be "closed," must not be at a temperature higher than about that of a dull red heat. We state "if of that material" advisedly, because iron rivets were commonly used in the early examples of steel bridges, roofs, and other similar structures. Only a year ago, when the reconstruction of the Morand and La Fayetté bridges over the Rhône at Lyons was in progress, iron rivets were used instead of steel in one of the bridges, which, like the others, consisted of solid steel arched ribs abutting on cast-iron skewbacks. It was stipulated in the specification that the rivets for all these new bridges should be made of steel; but an exception was made in the instance alluded to on the grounds, alleged by the contractor, that the workmen engaged under him were not sufficiently acquainted with the process of steel riveting to be certain of doing good work. It is evident, therefore, that the operation demands a special kind of handicraft with which the ordinary iron riveter is not always acquainted. It would appear that steel rivets are more likely to fill the holes better than those of iron, for, as they are not "closed" at so fierce a heat, they will not contract, or, so to speak, shrink so much in cooling.

Referring again to Figs. 12 and 13, it is clear that the jointed plate is also held to a certain extent in its place by the regular riveting uniting it to the other plates, and the longitudinal angle irons. The whole case is quite distinct from the simple jointing of two plates in one and the same plane, and in which outside the area of the joint we have the gross area equal to the net; or, employing a former equation—

$$N = G = (b \times t).$$

A cross-section of the joint in Figs. 11—13 is shown in Fig. 14, in which *a a* are the outside cover-plates, *b b* those on the inside covering the horizontal angle-irons, and *c c* the packing strips inserted to constitute a flush connection for the whole interior part of the joint. We have now to consider the method of riveting up the cross-girders, the rolled joints, platform, and general erection of the bridge. There would be no difficulty in a bridge of only 60ft. in span, in building it upon one or other of the approaches, and then launching it on to its permanent site; but, on the other hand, if it were permitted to put up a temporary scaffolding underneath, the contractor would probably prefer the latter expedient.

FIG 14

WAGES AND HOURS IN LIVERPOOL.

THE city council of Liverpool received at their last meeting the following return comparing the hours of labour and rates of pay in the City Engineer's Department compared with those recently issued by the National Association of Master Builders:—

CITY ENGINEER'S DEPARTMENT.

	Average hours per week.	Wages summer and winter.	
		Day.	Week.
		s. d.	s. d.
Masons	53·3	5 6 to 6 6	33 0 to 39 0
Bricklayers	53·3	6 2	37 0
Carpenters and joiners	53·3	6 0 and 6 4	36 0 and 38 6
Plumbers	53·3	5 8	34 0
Masons' labourers and bricklayers' labourers	53·3	3 6 to 4 6	21 0 to 27 0

NATIONAL MASTER BUILDERS' ASSOCIATION.

	Hours per week.		Wages per week.	
	Summer.	Winter.	Summer.	Winter.
			s. d.	s. d.
Masons	49·5	44·5	37 1·5	33 4·5
Bricklayers	50	47·5	37 6	35 7·5
Carpenters & joiners	50	47·5	35 5	33 7·75
Plumbers	50	47·5	37 6	35 7·5
Masons' labourers and bricklayers' labourers	50	47·5	20 10 and 22 11	19 9·5 and 21 9·25

At Brownlow-street Central Store Yard, the hours throughout the year are 55½ per week. Men working underground are paid 6d. per day additional to above rates.

Mr. Boulnois, the city engineer, reported that nothing more than a general comparison could reasonably be made between the wages paid in the City Engineer's Department and by the Master Builders' Association, as the Corporation workmen are paid the same wages in the winter as in the summer; the men receive 6d. per day extra when working underground, and practically the Corporation give constant work and other advantages.

"THE DELL," NORTHFIELD, WORCESTERSHIRE.

THIS house stands about 30 yards from the road at the top of a large dell surrounded by oak-trees. It has been carried out in local bricks and tiles by Mr. D. Edwards, builder, Bank Green. The lead lights by Messrs. J. R. Lee and Co.; iron casements by Messrs. Hope and Sons. The hall is panelled to the height of about 4ft. The downstairs rooms have beamed or moulded plastered ceilings. The hall is so planned that it can be shut off from the rest of the house, and so form a third room. The architects are Messrs. T. W. F. Newton and Cheatle, 121, Colmore-row, Birmingham.

HOUSE SANITATION AND THE CONSTRUCTION OF WORKMEN'S DWELLINGS.

At the closing meeting of the International Hygenic Congress at Buda-Pesth, held on Friday, an animated controversy took place in a combined meeting of two sections in reference to the construction of workmen's dwellings. The discussion was initiated by Professor Corfield, of London, who submitted a series of resolutions asserting, first, that the general health of the population was improved and the spread of disease prevented by the frequent removal of all foul matter and a copious supply of pure water; secondly, that the paving of streets should be smooth and, as far as practicable, impervious, so as to facilitate cleansing and prevent the contamination of the subsoil; thirdly, that the access of damp air and moisture to houses should be prevented wherever necessary by means of an impervious basement floor, and a damp-proof course in the walls; fourthly, that house drains should be watertight, and should each be provided with a disconnecting trap to prevent the access of foul air from the sewer, and should be freely ventilated; fifthly, that street sewers should be ventilated in such a manner as to prevent foul air entering houses and streets, and should be well flushed so as to prevent the accumulation of foul deposits; sixthly, that the minimum width of streets should be 40ft. between the houses, and that the houses should not be higher than the width of the street in which they are situated, nor built back to back; seventhly, that regulations should be made by public authorities with a view to enforcing the practical application of the principles here laid down. These proposals gave rise to a heated discussion. Mr. Arthur Cates, of London, objected to the limitation of the heights of houses to the width of the street. Other members of the section strongly opposed the declaration against houses built back to back. The fourth resolution, dealing with house sanitation, was also warmly contested on the ground that it would prevent further experiments in sanitary science, and that the disconnecting trap itself, which diminished rapidity of flow, was unscientific. The Continental delegates were disposed to think that the British did not take a broad enough view of the question of sanitation, and suggested the appointment of a committee to formulate new resolutions. Professor Corfield, replying to these objections, said that his calculations had been subjected to most contradictory criticism. Some thought them too general, others too detailed. As he could not consent to his resolutions being emasculated, he begged, with the consent of his seconder, Dr. Pistor, of Berlin, to withdraw them. This was accordingly done. Mr. Thomas Blashill, the superintending architect to the London County Council, subsequently explained to the section, with the aid of drawings and a plan of the block, the associated buildings and artisan dwellings now being built by the Council at Blackwall and elsewhere in the Metropolis. He said that they were intended chiefly for artisans, messengers, and other workmen earning an average wage of 21s. a week. The average cost to the County Council would be about £80 per room. This was more than had been spent previously on construction, but the cost of building had greatly increased in London during recent years. The Council had the power to borrow money at 2¾ per cent., and they intended to let these buildings at a rent yielding only about 3 per cent. on the cost.

COUNTY LUNATIC ASYLUMS.

By George H. Bibby, F.R.I.B.A.

INTRODUCTION.

The general treatment in mental disease had formerly little purpose beyond the aversion of the danger that might arise to the sane from the uncontrolled roaming of such as were mentally deranged, or the requirement for the preservation of public order. Some were confined in hospitals, others in penitentiaries and workhouses, and usually in most wretched apartments. To treat them as patients was a thing unthought of: the great aim was to render them harmless—a method said to have been adopted from a mistaken notion of their excessive bodily strength. This was frequently effected by very rough measures. The unfortunate creatures, often oppressed with chains, pined away behind iron bars in wretchedness and filth, in the endurement of tortures and lashes. The remaining traces of humanity could not but disappear, and whoever once crossed the threshold of an asylum was considered lost.

When at length it began to be considered a requisite that asylums should be new and specially erected institutions, in many countries men hesitated at a prospect so expensive as the erection of several large establishments, with complicated arrangements and increased medical superintendence. They could not, however, return to the former system of mingling all the insane, but perceived the necessity of separating the various classes.

A very large number of the insane are brought under treatment far too late. In its first stages insanity is frequently curable, and on its appearance help against it should be sought without a day's delay, since every hour adds to the difficulty of cure, and after a delay of two or three months, relief (perhaps a long relief) may indeed be obtained, but cure may have become nearly impossible.

These facts are, however, far better known and understood than was the case some twenty-five years ago, and one result is that a far larger proportion of the population are under asylum treatment; but the increase of insane patients arises from various causes beyond the inclusion of a class who were formerly neglected, under unsuitable private care, wandering about the country, or indiscriminately mingled with the workhouse inmates, and merely classified as paupers—as is still the case in many districts in England, Ireland, and Scotland.

The special importance of the subject to architects will be perceived if it be remembered that there are in England alone no less than 170 asylums (public and private), and that some of these have cost (exclusive of land and furnishing, &c.) so much as £500,000, the price per patient varying from £80 to £250, or £300 in special cases.

In Scotland there are about 50 asylums (including lunatic wards and poorhouses), and there are 42 asylums in Ireland, where, however, there are also no less than 4,334 lunatics and imbeciles confined in union workhouses. Many of the asylums in Ireland appear to be wholly insufficient for their purposes; for instance, the Richmond Asylum, near Dublin, is so overcrowded as to act most injuriously on the patients' health, and materially lessen the prospects of their recovery, and to disorder every department of that institution. In this asylum the female observation dormitories are (or were lately) so overcrowded that not only were the beds placed side by side, but mattresses have had to be placed on the floor to provide for additional patients! In view of the constantly-increasing numbers of the insane, of the utter unsuitability of many of the older asylums (and some of the more recent), there appears to be a great probability of extensive asylum works in all parts of these islands, and of considerable work for architects and the building trades.

In actual practice, the architect who is intrusted with the erection of a large asylum will always find it of great importance to have facilities for consulting from first to last a well-experienced medical officer, and it would be well, when a new asylum is projected, that the medical officer should be appointed to the asylum before it is erected. If this were always done, much loss and trouble would be avoided in alterations, &c. In times past I well recollect (although nearly 30 years since) a great medical authority on the subject of insanity taking a temporary seat in an architect's office, and performing draughtsman's work as an expeditious mode of conveying his views and instructions to the architect. This gentleman was one of the most accomplished medical superintendents of the day, but ultimately is said to have become a remarkable example of the fact that continued and close contact with the insane is an occasional source of absolute danger to the mental powers of the sane, and suggests the advisability of an architect so arranging his plans that the apartments for the officers when off duty shall be so disposed as not to be within sight or hearing of the patients.

In no class of building can an architect make himself more felt as a lasting benefactor to the occupants than in a lunatic asylum, and, in order that he may be armed with every probability of success in arranging his plans, he must to some extent study the ways and mode of life of those for whom he provides. It is most desirable, therefore, that he should have an intimate knowledge of the position of the medical superintendent, for this very knowledge must influence his ideas in the planning of the buildings.

Architects who will not endeavour to bring their asylum plans into conformity with the desires of an experienced medical superintendent are likely to regret their omissions before the end of the work; but of course, in absolutely architectural matters the architect should take precedence.

A modern county asylum has been in some respects compared to a general infirmary; the differences, however, are more noticeable upon an internal than an external view. With regard to the patients in hospitals, most of these are in bed both by day and night; but in asylums the majority are employed or distributed about the day-rooms, &c., during the daytime. An infirmary does not require many single-bedded rooms, while in an asylum—according to some authorities—at least one-fourth of the patients should be accommodated in rooms having only one bed. These conditions render the designing of an asylum a very much more complicated work than for a hospital.

Many of the county and private asylums of this country are situated in finely laid out grounds or parks, and the luxurious arrangements, comforts, and pleasures which are provided for the pauper-patients are often in very striking contrast with the surroundings of their sane relatives, many of whom may be living a miserable existence, the result perhaps of the former drunkenness, vice, and improvidence of an asylum inmate.

The housing of the pauper-insane has hitherto been more costly, in proportion, than for any other section of the poorer class. The cost of the land (of which, at least, 100 acres are requisite for an asylum for 1,000 patients) is the first serious item, and its selection is a difficult matter. Suitable sites are somewhat difficult to meet with, as the requirements are so varied. The situation should be elevated with regard to the adjacent district generally, with cheerful adjuncts, and should not be at an unreasonable distance from the abode of the population from whom its inmates are collected, particularly with a view to the visits of patients' friends and the supply of fuel and provisions, &c.

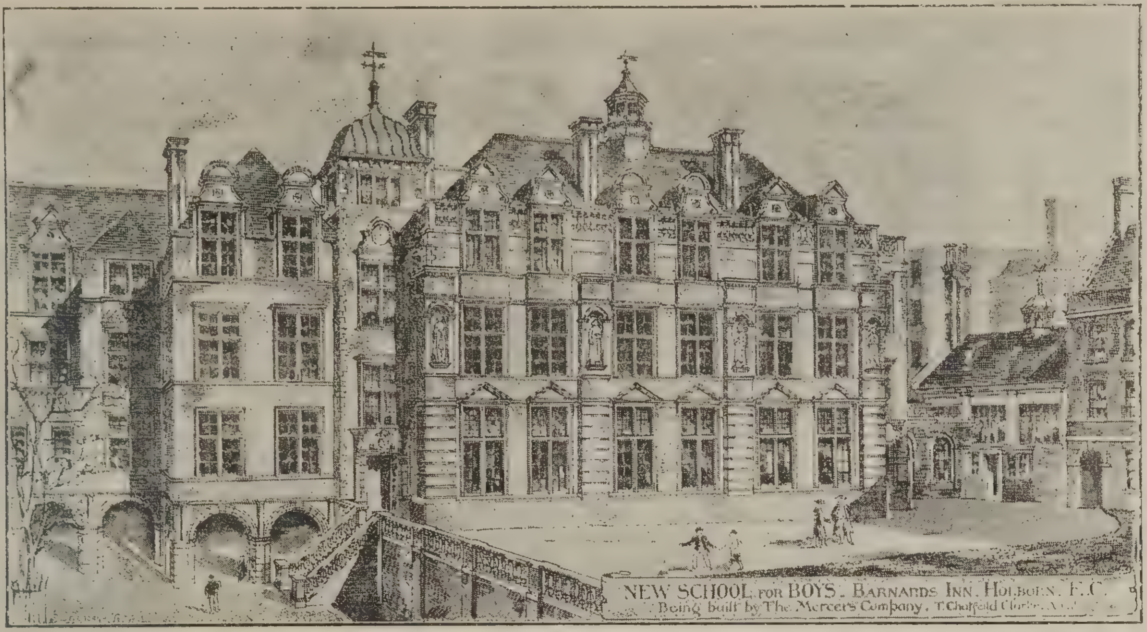
The water supply and sewage-farming questions are also to be considered, prior to the selection of a suitable locality for the buildings. It has been suggested that future asylums shall be limited to accommodate not more than 1,000 patients each, upon the ground that it seems impossible that one medical superintendent should know all the idiosyncrasies, &c., of so large a number of patients as are often placed in his charge.

For kindred reasons it also appears that the periodical enlargement of existing asylums is objectionable. Not infrequently additional day-rooms and dormitories have been added without a corresponding addition to the administration buildings, which latter have in consequence become utterly inadequate for the service. Further than this, overgrown asylums have long since been proved to be disproportionately costly, though the waste and loss occasioned by the multiplication of servants, and the difficulty of subjecting them to the individual and constant oversight of a single responsible head, and because a medical officer, let him work as he will, cannot do his duty thoroughly in the care and treatment of patients, unless there be reasonable limits to their number.

(*To be continued.*)

LAYING OUT STREETS.

Some valuable hints are given in J. Stübbens's paper on the "Practical and Æsthetic Principles for the Laying Out of Cities," prepared for the International Engineering Congress of the late Columbian Exposition. The author, speaking of streets and squares, says the former should not be too long. Too great length of street wearies the eye and awakens a feeling of discomfort. The danger of this unpleasant sensation begins when the length exceeds 20 or 30 times its width. Should a change of direction be undesirable for practical reasons, the author suggests varying its width and cross section. Gentle curves are preferable, especially those which conform to superficial outlines or natural boundaries. It is not necessary that the two sides of a street should be always parallel. A pleasant effect may follow from irregular widths of streets at the opening of squares. A street ought not to be straight over a summit—i.e., convex changes of grade are to be avoided. Passing over a high



NEW SCHOOL FOR BOYS. BARNARDS INN. HOLBORN. E.C.
Being built by The Mercers Company. T. Chatfeild Clarke

point is best accomplished by a bending of the street in plan and profile, the course of which the eye cannot follow beyond the ridge. The interruption may be a vertical one, in the form of a monument, a fountain, or plantation, or a horizontal interruption in the form of a crossing. The concave profile is more handsome than a convex one. It affords to the street surface by day and by night a pleasing spectacle of light and shade. The author suggests that if the street surface cannot be laid out with rows of trees and garden plots, a width is to be preferred restricted to traffic and health. Those portions not required for traffic should be adorned with garden spaces, monuments, fountains, arcades, and other architectural adjuncts, and also tasteful erections such as trading stalls, waiting-rooms for street tramways, conveniences, alarm-boxes, drinking-stands, lamp-posts, street-signs, boxes for sweepings, inclosures, &c. These subordinate objects of utility, if artistically designed, give pleasure. Other suggestions are made on the relation of streets and squares to the buildings of more or less value, to which we may call attention. The Metropolis has benefited by many of those features we find in Continental cities, such as avenues of trees, improved lamp-standards, fountains, boxes for sweepings, shelters, and conveniences; but a great deal more remains to be done to render our embankments and main thoroughfares ornamental as well as useful.

NEW MERCERS' SCHOOL, BARNARD'S INN, HOLBORN.

WE illustrate this week the renovated and newly-erected buildings in Barnard's Inn, to which the school of the Mercers' Company has been removed from College-hill, Cannon-street, and which were opened by Earl Selborne on Tuesday. The Mercers' Company, through their surveyor, Mr. Daniel Watney, purchased the site of Barnard's Inn, Holborn, an area of 27,000ft. superficial, including the buildings standing thereon, two years ago. The new building is faced with red bricks, with Ancaster stone dressings. One of two entrances to the main block of buildings is surmounted by a clock-tower. The old Inn Hall has been retained and redecorated, to be now used by the boys as a dining-room, and with this object kitchens, sculleries, &c., have been built in close proximity. The headmaster's room adjoins the dining-hall, and then the main block of buildings follows—with its large assembly-hall on the ground floor, a room 70ft. by 40ft., with an arcade on its western side. On the same floor a large lecture room is provided, and also the physical laboratory and science master's room, and a special classroom for the headmaster, Dr. Scott. On the first floor are six large classrooms, and the second floor has a similar number. These rooms are lofty, and all lighted from the left-hand side, with glass screens to the corridors. They are fitted with open warm-air stoves, and the larger rooms and all the staircases and corridors are heated with low-pressure hot water, which is also used for extract purposes in a large trunk placed on the roof. Under the lecture-room block a covered playground has been provided for use in bad weather. A separate building of three floors, backing into Fetter-lane, contains the chemical laboratory and the drawing school. The buildings are fireproof throughout, and they have been fitted both with fire hydrants and with the electric light, no gas mains being introduced into the premises. The total accommodation is for 300 boys, exclusive of the lecture room, laboratory, and drawing school. The classrooms are being fitted with single desks, and a separate locker is provided for every boy's hat and coat. The lavatories are situated in a distinct building in the playground. Messrs. E. Lawrance and Sons, of Wharf-road, City-road, have carried out the works, from designs prepared by Mr. T. Chatfeild Clarke, F.R.I.B.A., under whose direction and that of his son and partner, Mr. Howard C. Clarke, the buildings have been erected. Mr. J. P. King has acted as clerk of the works.

THE A.A. BROWN BOOK.

THE familiar calendar, members' roll, and lists of meetings and classes of the Architectural Association has just been issued, more than a month earlier than usual. The committee, in their report, state that during the year 96 new members were elected, 4 members were reinstated, and the losses by death, resignation, and other cases amounted to 98, leaving a net increase of 2, the total number being 1,131, against 1,129 in 1893. (The number of members was 1,125 in 1892, 1,138 in 1891, against 1,129 in 1890, 1,094 in 1889, 1,052 in 1888, 993 in 1887, and 972 in 1886, there thus being shown a slow, but steady, increase year by year.) A meeting of instructors and lecturers was held on the 4th April to discuss the methods of teaching adopted, and the work done in the Classes and Studios. Suggestions were made tending to increase the efficiency of the classes and lectures, but no radical changes were recommended either in methods of teaching or conducting the classes. An innovation, which has already had good results, has been the holding of a meeting of class secretaries for the discussion of A.A. matters from their point of view. The committee refer with satisfaction to the marked increase in the members attending the ordinary meetings of the Association and in the discussions on the papers read, and they also refer with gratification to the marked improvement in the financial position of the Association as compared with last session. As in former years, it is stated that "the committee have viewed several premises; hitherto none have been found suitable, but the matter is still under consideration. There is, therefore, nothing definite to report in respect to the premises question, although the need for additional accommodation is greater than ever." The attendance in the Studio and Classes is said to be generally satisfactory, particularly as regards the number of students in the Studio and Classes in Divisions I. and II.; but an unfavourable report is made with regard to the number of students in Divisions III. and IV.

It is stated that the sub-committee appointed so far back as Jan. 24 last, to inquire and report if and in what manner the Association can exert its influence towards the organisation of a more thorough system of education than at present exists for artisans in the London building trades, and its future supervision by architects, have not yet submitted their report, although they have made numerous inquiries. During the past session papers were read by Messrs. A. Beresford Pite, H. W. Barnes, Owen Fleming, A. O. Collard, J. Daymond, E. Woodthorpe, J. L. Robinson, S. B. Beale, F. E. Masey, W. H. Seth-Smith, R. A. Briggs, H. Longden, and Arthur Bolton, all of which were fully reported in our columns at the time.

The syllabus for the ensuing session is as follows, the meetings being held, as hitherto, at 7.30 on alternate Friday evenings, in the hall of the Royal Institute of British Architects:—

Oct. 26, 1894.—Annual General Meeting: The President's Address, E. W. Mountford.

Nov. 9.—"The Study of Modern Architecture," A. Beresford Pite.

Nov. 23.—"Sanitation in regard to Hospitals and Infirmaries," Keith D. Young.

Dec. 7.—"The Modern Theatre of the Continent," E. O. Sachs.

Jan. 4, 1895.—"Architectural Illustration," C. G. Harper.

Jan. 18.—"Bricks," John Slater, B.A.

Feb. 1.—"Architectural Perspective," W. S. Weatherley.

Feb. 15.—"The Bridges of London, Architecturally Considered," with Illustrations, H. H. Statham.

Mar. 1.—"The Use of Sculptural Decoration at the Present Time," T. Stirling Lee. "Plasterwork," F. W. Pomeroy.

Mar. 15.—"Iron and Brass," J. W. Singer.

Mar. 29.—"Specifications: from a Builder's Point of View," Henry Holloway (Holloway Bros.). "Specifications: from an Architect's Point of View," E. C. Pinks

April 26.—"Painting and its Relation to Architecture," C. W. Whall.

May 10.—"Treillage," John Belcher.

May 24.—"The Influence of Architectural Style upon Design," Walter Crane.

BOOKS RECEIVED.

The Practical Designing of Structural Ironwork, by Henry Adams, M.Inst.C.E., M.I.Mech.E., &c., Professor of Engineering at the City of London College, first series, revised and enlarged (London: E. and F. N. Spon, Strand), is a volume that will be welcomed by all engineering and architectural students who are anxious to make themselves proficient in the designing of iron girders, bridges, roofs, and stanchions. The subjects, or many of them, have appeared in pamphlet form, and have been noticed in these pages—such, for example, as the detailed calculations and notes for the design of a small cast-iron girder, a wrought-iron girder, a flitched beam, cast-iron bridge-girder, roof truss. Of the merits of Professor Adams's method and treatment we have before spoken with commendation, and we believe many a student has learnt more from these practical examples of designing than they have from the ordinary textbook, of which there are so many, filled with algebraic formulæ and equations unintelligible to the majority of students. The notes and calculations are brief, and each subject is discussed in the manner which a practical engineer would adopt in making a design for any iron structure. The working out of each step is clearly stated. We may add here that the author's new series of lectures on designing ironwork has been commenced at the City of London College, and the notes of those will be published as before. Any student who desires to acquaint himself with the subject of construction cannot do better than join the classes of Prof. Adams.——Among the principal contents of the *Illustrated Archæologist* for September (London: C. J. Clark, Lincoln's Inn-fields) is an article on "Asurbanipal: his Books and Buildings," by Mr. Leonard W. King, who describes the formation by that monarch at his palace in Nineveh of a universal collection of inscribed tablets and copies of others, instituting the first great national library in the world. The only remains of the fittings of this library that have come down to us are two labels, oblong pieces of clay, inscribed with titles, now to be seen in the British Museum. Mr. G. F. Hill, in a paper on "Roman Copies and Greek Originals," points out the danger from an archæological standard of the study of Roman imitations of the masterpieces of Greek art, although their examination is of service in elucidating the history of the mechanical development of ancient art. Another illustrated contribution is on "Sussex Iron," by Mr. W. Christian Symons.

ELECTRIC-LIGHTING FOR A MARKET HALL.

THE installation of the electric light at the Market Hall at Birmingham is nearly complete, and the new illuminating appliances will be brought into use in about a fortnight. At present the hall is lighted by a central ring of gas-jets and by standards and naked burners connected with the various stalls. Altogether there are 550 burners to illuminate a building 350ft. long and 100ft. wide. The gas is lighted on an average for 15 hours per week, and before the rise in the price of gas the payment to the Gas Department was about £470 per annum. The recent rise will increase this to £522 per annum. Inquiries and experiments were made by the markets committee as to an improved method of gas-lighting, and it was found that electric arc lights would be more economical. The new installation consists of 33 arc lights, of which 16 will require an electric current of 15 ampères, and seven a current of 10 ampères. Each circuit includes two lamps, and each current of 15 or 10 ampères passes, therefore, through two lamps in series. The lamps will be suspended over the gangways of the hall at a height of 14ft. from the floor Externally, nine lamps will be placed on artistic standards at the four entrances from as many streets. The electric energy will be taken from the Electric Supply Company's mains in Bell-street. The switches have been so arranged that when only half the internal lamps are in use, the light will still be uniformly distributed. The light from the arc lamps will be between three and four times that derived from the present gas-lighting, even after allowing for the loss of half the total light on account of the use of opaline globes around the carbons. The cost of running the electric lamps will be £507 for energy and £25 for carbons, as compared with £522 for gas. The new installation has been designed by Messrs. Henry Lea and Thornbery, civil engineers, of Birmingham, under whom it is being carried out by the Walsall Electrical Company as contractors. Messrs. Lea and Thornbery also have in hand the introduction of electric lighting for the new Meat Market, the Municipal School, and Botanical Gardens, all at Birmingham. The arc lamps are of the Brockie-Pell pattern, and the ornamental ironwork is by Messrs. Hart, Son, and Peard, of Drury-lane, London, and Birmingham.

◆

A new Wesleyan chapel, which has been built at a cost of £3,300, and provides accommodation for 620 adults, was opened at Bank's Hill, Morley, on Thursday in last week. Under the chapel is a schoolroom, with accommodation for 300 scholars.

OBITUARY.

Professor Brugsch Pasha, the well known Egyptologist, died at Charlottenburg, on Monday, after a long illness. Heinrich Karl Brugsch was born in 1827 in Berlin, and while still at the Gymnasium he published a pamphlet entitled "Scriptura Aegyptiorum Demotica," a contribution to the knowledge of the language and hieroglyphical characters used by the ancient Egyptians. This publication and some other treatises on Demotic writing procured for the author the patronage of Von Humboldt and King Frederick William IV., who liberally supported Brugsch's studies. After completing his philological and archæological studies in Berlin and making researches at the British Museum and those of Paris, Turin, and Leyden, Professor Brugsch made his first scientific journey to Egypt in 1853, and there met M. Mariette, the French archæologist, whose excavations near Memphis furnished abundant material for linguistic and historic studies. In 1854 he returned to Berlin, and was appointed Keeper of the Egyptian Museum. As a result of his first visit to Egypt he published "Reports on a Visit to Egypt," followed by the work entitled "Monuments of Egypt." The archæological researches of Professor Brugsch during his second visit to the countries of the Nile in 1857 and 1858 were described in his "Recueil de Monuments Egyptiens." At the beginning of 1860 he accompanied the Prussian Embassy to Persia in an official capacity, and made a tour through that country with Baron von Minutoli, the head of the mission. Upon the death of the latter he assumed the direction of the Embassy. On his return in 1861 he published an account of the journey of the mission. In the autumn of 1864 Professor Brugsch was appointed Prussian Consul at Cairo. In 1868 he returned to Germany and accepted the post of Professor of Egyptology at Göttingen. This post, however, he only held until 1870, when, in response to an invitation from the Khedive, he again went to Egypt in order to assume the direction of the Ecole d'Egyptologie at Cairo. In 1873 Professor Brugsch acted as Egyptian Commissioner-General at the Vienna Exhibition, and three years later he organised the Egyptian section of the Philadelphia Exhibition. He afterwards lived alternately in Cairo and Graz, and in 1879 he settled for a time in Berlin, where he delivered a series of lectures at the University. In 1882 he accompanied Prince Frederick Charles of Prussia on a journey through Egypt and Syria. He was again in Persia in 1884, but since 1886 he has lived in Berlin. He was the author of many important works on Egypt and its history, on the hieroglyphics, and on other kindred subjects.

Mr. James Naylor, of Birkenhead, who was for nearly forty years one of the leading contractors for the Admiralty and other Government departments, died on Wednesday. A native of Glasgow, where he was born in 1817, he became connected with Fox, Henderson, and Co., London and Birmingham, and in 1852 established the Britannia Engineering Works at Birkenhead. He was the inventor of the floating graving dock, and the inventor and builder of some of the largest steam cranes in the kingdom. Many of his inventions have been used in Her Majesty's dockyards.

The Canadian papers announce the sudden death at Toronto, in his 67th year, of the Hon. Christopher Finlay Fraser, for the last twenty years Commissioner of Public Works for Ontario. Since he took the appointment in 1870, says the *Toronto Globe*, "the affairs of his office have been administered with thoroughness and unswerving honesty. The adminstration of the Works Department of Ontario was regarded as much nearer perfection than it is given mundane things to be." Many important buildings were erected under the superintendence of Mr. Fraser. The Mercer Reformatory, the Mimico Asylum, the Orillia Asylum, the Brockville Asylum and others bear testimony to the manner in which Mr. Fraser's work was done. "The erection of the new Parliament buildings was," says the *Globe*, "the last and greatest triumph of Mr. Fraser's administrative career. Their low cost, taken in connection with their solidity, throughly good work, convenience, and fitness for the needs of a great Province, is the wonder of American visitors. The Province for which they are built is one of more than two million people, of vast extent, and contains a large unorganised territory, stocked with rich resources under the control of the Government. The administrative work carried on in the building is varied and of high importance. Taking population, territory, and law-making and administrative powers into consideration, there is no State Legislature or Government in the Union, with the possible exception of New York, which has more important duties than those that are discharged in the Ontario Parliament buildings. What is the comparison as to cost? They were built for about a million and a quarter dollars. The Illinois State buildings cost three and a half millions, the Michigan State buildings a million and a half, the New York State buildings more than twenty millions of dollars."

CHIPS.

The Batley town council adopted on Friday a plan for widening and straightening the High-street at Carlinghow, at an estimated cost of £5,000.

A scheme has just been completed at the Free Methodist chapel, George-street, Burton-on-Trent, in connection with which the chapel has been restored in accordance with modern requirements, and new schools have been erected. The total cost has exceeded £7,000.

The death is announced of Mr. W. F. Palmer, vice-chairman of Platt Brothers and Co. (Limited), Oldham, at an advanced age. Mr. Palmer was a native of Stafford, where his father held the office of taskmaster at H.M. prison. Fifty years ago Mr. Palmer practised as an architect in Tipping-street, Stafford, in partnership with Mr. Boulton, whose sister he married.

The first submarine block of the new east pier in connection with the Harbour of Refuge at Dover was laid on Thursday in last week on the bed of the sea. The huge stone blocks will be laid with the aid of diving-bells.

M. Zola and the editor of the *Gil Blas* have been served with writs for libel, at the instance of M. Bourgeoise, builder of the church at Lourdes.

George-street Free Methodist chapel, Burton-on-Trent, was reopened last week after renovation, the work of beautifying and improving having taken about five months. The total cost of the work has been about £7,000, and among the improvements are the introduction of the electric light, a better system of heating, and the transfer of the organ from St. Paul's Church in the same town to the chapel.

An organ built by Messrs. Steel and Keay, of Burslem, has been placed in Melton Church, Staffs, and was formally opened on the 6th inst. The case is of figured pitch-pine, and the front pipes are illuminated in gold and colours.

The East Riding Antiquarian Society have just recommenced the excavations on the site of the long-buried Abbey at Walton, a branch of the greater Abbey at Whitby. The work was commenced last summer, and a special meeting of the society will be held at Walton on Tuesday week, the 25th inst.

It was resolved at a conference of South London vestries and district boards at Peckham, on Friday night, to form a committee for the purpose of securing the abolition of the Lambeth bath tax.

A fisheries school is about to be established at Falmouth, after the plan of those that have been so successfully in operation in Norway, France, Holland, and the United States. It is intended to develop hatcheries and the planting of young shell and fish life, and to erect a building to serve as a laboratory and museum. The scheme is supported by the Cornwall County Council and the Royal Cornwall Polytechnic Society.

The Duke and Duchess of York began at Birmingham, on Saturday, a series of public ceremonies in the large provincial cities, the occasion being the laying of the foundation-stone of the new General Hospital in Steelhouse-lane. We so recently described the building in detail, that it is only necessary to repeat that Mr. W. Henman, of Birmingham, is the architect, and Messrs. Burnsley and Sons are the contractors. The hospital will contain 342 beds, and will cost about £206,000 (including £48,000 for site), of which £140,000 has been promised.—On Monday the Duke and Duchess visited Liverpool to lay the foundation-stone of the new General Post-office. In the cavity of the foundation-stone was placed a bottle containing copies of the Liverpool daily papers and of the Building News for Oct. 27, Nov. 24, and Dec. 15, 1893, these three copies of this journal containing illustrations and descriptions of the building. Mr. Henry Tanner, of H.M. Board of Works, is the architect, and Messrs. Thornton and Sons, of Liverpool, are the contractors for the removal of the old buildings on the site and the excavations, foundations, and vaults; the general contract for the building, which will be French Renaissance in style, and cover an area of 280ft. by 300ft., has not yet been let.

NEW SCHOOL BOARD OFFICES, SALFORD.—NATIONAL GOLD MEDAL DESIGNS FOR BOOK ILLUSTRATION.—ST. BARNABAS CHURCH, GREAT TEY, ESSEX.—ST. PAUL'S CHURCHYARD. —THE EGYPTIAN COURT, CRYSTAL PALACE. — THE RECTORY, BRONDESBURY.—"THE DELL," NORTHFIELD, WORCESTERSHIRE.—ENGLISH AND FOREIGN TYPES OF FURNITURE.

Our Illustrations.

SCHOOL BOARD OFFICES, SALFORD.

This building, the foundation-stone of which was laid last Wednesday, has a frontage of 103ft. to Chapel-street, and will be faced with Messrs. Doulton's tawny terracotta, on a base of grey Aberdeen granite 8ft. high, the roofs being covered with dark green Westmoreland slates. Two entrances are provided; the principal one, which is in the centre of the Chapel-street elevation, gives access to the hall and main staircase. A side entrance is placed at one extremity of the front, leading to a staircase communicating with all the floors. On the ground floor are the offices of the clerk to the Board, cashier, with strong room, organising master and clerks' general office and waiting-room. On the first floor the board-room 45ft. long and 23ft. wide occupies a large portion of the fronts. A committee-room communicates directly with the same, and two large members' rooms and waiting and cloakrooms are adjacent. On the second floor the assembly-room, 75ft. long and 30ft. wide, is placed, with its ante and retiring-rooms, with lavatories in convenient positions. In the basement there is a large waiting-room giving access to three minor committee-rooms, and offices for the school attendance officials and the superintendent. The heating chamber in the sub-basement is entered from the yard at the back of the office. It is intended to finish the hall, staircase, the board-room, and corridors with a panelled dado six feet high, this and the whole of the woodwork to the principal rooms being in oak. The floor of hall and corridor will be laid with mosaic. In addition to the open fireplaces provided throughout, a scheme of heating and ventilating by warm air has been adopted. The cost of the building, exclusive of furniture, will be about £12,000. The work has been let to separate contractors, a list of which we append: Brickwork, Mr. C. H. Normanton, of Manchester; woodwork, Messrs. Halstead Brothers, of Eastwood; stonework, Mr. Thomas Derbyshire, of Stockport; plumbing, Mr. Openshaw, of Salford; plastering, Sir J. J. Harwood and Sons, of Manchester; ironwork, Mr. Myles Cooper, of Manchester; slating, Mr. Barrow and Sons, of Manchester; granite, Messrs. Fenning and Co., London; terracotta, Messrs. Doulton and Co., London; heating, Messrs. Langfield and Co., Manchester; decorative woodwork, Messrs. Waring and Co., Manchester. At the rear of the offices the board is erecting a Central Higher Grade Scholarship school, at a cost of £11,000. The memorial stones of both buildings were laid on Wednesday, the 12th inst., by Canon Scott, M.A., the chairman of the board. The architects of both buildings are Messrs. Woodhouse and Willoughby.

NATIONAL GOLD MEDAL DESIGNS FOR BOOK ILLUSTRATION.

This double-page plate represents a selection of designs by Mr. R. Spence, of North Shields, for which a National Gold Medal was awarded last year. The large drawing is a composition for a given subject—viz., "The Archer." Considerable force and suggestion of action is obtained by the foreshortening of the arms of the bowman, a treatment necessitated by the narrow width of the upright panel here adopted. Of the two smaller designs the lower one, representing an engagement on board ship, is an illustration of Dr. Conan Doyle's book "The White Company," and the upper picture is entitled "The Banner," which was likewise a subject set in competition for the prize. Mr. Spence has been so far successful as to win another gold medal this year.

ST. BARNABAS CHURCH, GREAT TEY, ESSEX.

This picturesque representation of the historic tower at Great Tey is one of those drawings awarded a consolation prize in our late Competition for the Artistic Rendering of Architectual Subjects. The author of the study is Mr. William Ffrench, of Colchester. Of the building itself little need be said, as its character has suffered very considerably through rebuilding and repairs. The nave was entirely re-erected in a poor style some time since; but the fine Normal central tower, largely composed of Roman tiles or brick, is of massive proportions and is typical in its style. In the turret one light is composed of a whole Roman flue tile, which circumstance has before been noted. The chancel is described as of "Decorated" work, and the cruciform plan of the church is made out by the north and south chapels forming the arms of the cross. There is a built-up Norman arch with piers in the interior of the church.

ST. PAUL'S CHURCHYARD.

This illustration, drawn by Mr. F. Williamson, of Bloomsbury, is taken from a blue-black washed study submitted by him in our competition for the "Picturesque Rendering of Architectual Subjects," and a consolation prize was awarded to the picture. The scene is so familiar, showing the Cathedral from the south-east looking from the island at the entrance to Cannon-street, that little description is really necessary. The south transept of the church and the clock tower are the leading features in the view; rich in their sooty dignity, much the better for "all the incense which all the chimneys since the time of Wren have offered at its shrine, and are still flinging up every day from their foul and grimy censers." "There cannot," says Hawthorne, "be anything else in its way so good in the world as just this effect of St. Paul's in the very heart and densest tumult of London. It is much better than staring white; the edifice would not be nearly so grand without this drapery of black." Mr. Williamson gives a good idea of this all-pervading impression of its dark majesty and sublime grandiose and sooty dignity, alone in indescribable stateliness. The ugly and pretentious buildings which flank the four sides of what is known as St. Paul's Churchyard, exhibit by their striking contrast the elegance and beauty of our Great Metropolitan church; but with the sole exception of the baldly plain "chapter-house," there is not one façade in the entire square possessed of a worthy architectural elevation for so notable a position; indeed, as if to surpass the rest, the new premises erected on the fresh line of frontage, west of the cathedral at the top of Ludgate Hill, excel in all the horrors of their nondescript commercial building, without any architectural merit whatever.

THE CRYSTAL PALACE EGYPTIAN COURT, BY JOSEPH NASH.

This drawing, contributed by Mr. Thomas Wolfenden, F.S.I., of Southport, is another example which we have chosen from the original architectural drawings by the famous Joseph Nash, and it is included in our series* of reproductions to-day, not only by way of variety of subject, in contradistinction from the views of old English mansions with which his name must ever be chiefly associated; but also as illustrating Nash's capability of handling so massive and formal a subject as that with which he had to deal when the Egyptian Court at the Crystal Palace was given him to illustrate. The design, largely based upon the authorities furnished by the celebrated Egyptian scholar the late Joseph Bonomi, was worked out by Owen Jones, who, in conjunction with Sir Digby Wyatt, schemed the Greek, Roman, and Alhambra Courts at Sydenham. This contemporary representation by Joseph Nash of a highly successful and learned restoration, thus produced by so distinguished a combination of archæological authority and artistic talent, cannot fail to be of interest now. At the time, the drawing was no doubt made for chromo-lithographic reproduction; but we have no details of the history of the picture.

RECTORY HOUSE, BRONDESBURY, N.W.

This building is faced with picked stock bricks, red bricks being introduced in the arches, bands, and chequered patterns. The dressings are of Doulting stone, and the roofs are covered with Sedan slates. The works were executed by Mr. J. Hicks, builder, of Stamford Hill, at a cost of about £2,100, from the design of Mr. Charles R. Baker King, architect.

"THE DELL," NORTHFIELD, WORCESTERSHIRE.

(See sketch and description on pp. 352 and 353.)

ENGLISH AND FOREIGN TYPES OF FURNITURE.

The Renaissance Cupboard, which holds the chief place on this illustrated sheet, is architectural in form; both the parts of which the double-bodied piece of furniture is composed, being treated with columns raised on bases and crowned with entablatures. The intercolumniations, friezes, spandrels, &c., are all richly carved with the allegorical subjects affected by foreign workers of the 17th century. The German Chest is a very fine example of the kind, thoroughly Gothic, with traceried panels which ornament nearly its whole surface. The change in the design of the tracery in the upper part is singular in its apparent want of system; but its very carelessness not only prevents a monotonous appearance, but even adds interest to it. The Jacobean Cabinet in oak and ebony is a handy piece of furniture, thoroughly typical of the period, and was to be seen at Messrs. Thomas and Co.'s attractive old house at Winchester. We gave an illustration of this house during and after restoration in the Building News of June 23rd, 1893. The Coronal Chair came from Cleadon House near Sunderland, and was one of a set recently sold by Messrs. Davison and Son, of Newcastle-on-Tyne.

CHIPS.

The Margam local board resolved at their last meeting to obtain the report of Mr. Willey, of Exeter, upon the advisability of constructing gasworks in the district of the board, and as to the probable cost.

The Canadian Trades' Union Congress, which is holding its sittings in Ottawa, has appointed a delegation to wait upon the Dominion Government to ask them to introduce a Compulsory Eight Hours Bill into Parliament next session.

We ought to have stated that the works of water supply at East Cowes, referred to in our last issue on p. 319, are being carried out for the local board under the direction of Messrs. Lemon and Blizard, of Southampton.

On Wednesday, a new Wesleyan Sunday-school at Colliery-row, Chilton Moor, co. Durham, which has been erected at a cost of £290, exclusive of building materials, which were a special gift, was opened. It is built of red bricks, with stone facings and pitch-pine seats, and a large schoolroom and vestry are attached. The contractor was Mr. March, of Lumley, and Mr. Shanks, of Lumley, was the architect.

The Brighton town council have adopted an extensive scheme for improving the sea front. The cost will be nearly £50,000, and the scheme provides for further provision against encroachments of the sea, the extension of Madeira-road Terrace, and the construction of a sea-wall a quarter of a mile in length.

Mr. F. H. Tulloch, M.Inst.C.E., an inspector of the Local Government Board, held an inquiry at the town hall, Ripon, on Friday, with respect to an application by the Ripon corporation for sanction to borrow £19,000 for purposes of sewerage and sewage disposal, and £1,050 for works of street improvement. The town clerk, Mr. M. Kirkley, appeared for the corporation, and Mr. A. E. Preston, of Bradford, the engineer of the works, exhibited and explained the sewerage scheme.

---

* Other examples by Nash will be found in the Building News for Jan. 5, Feb. 2 and 23, March 30, and Aug. 3, 1894.

WAYSIDE NOTES

THE vacant curatorship of the Sir John Soane Museum in Lincoln's Inn-fields, has, I hear, been temporarily filled, pending the formal election to the post, by Mr. J. P. Seddon, F.R.I.B.A., who for very many years was one of the Hon. Secretaries of the Royal Architectural Museum, Westminster, and before then was well known as one of the Hon. Secretaries of the Royal Institute of British Architects. The appointment, which is worth over £500 per annum and a house, is vested in the Trustees and Royal Academy, and I can hardly imagine a more worthy candidate than Mr. Seddon, whose knowledge of his art has always been largely associated with its literature and archæology. His prominent connection with the profession and acquaintance with the leaders of the profession also well befit him for the curatorship of such an institution as the Soane Museum. I sincerely hope the position will be confirmed to him, for no better candidate could be chosen.

M. Alfred Waterhouse, R.A., as the President of the National Society for Checking the Abuses of Public Advertising, points to the desecration of Nelson's Monument in Trafalgar-square by flashing lantern views on the column as a typical beacon light to warn Englishmen of the results of the absence of regulation in the matter of advertising. As the law stands, there is no remedy for this annoyance, and Mr. Waterhouse remarks that the public may be well assured that, bad as things are, they must persistently grow worse. Everybody who wants in this way, rather than by excellence alone, to gain notoriety for his wares, must outdo the efforts of his rivals, and thus all that has been expended to give dignity and interest to the aspect of London and our other large towns, will have been in great measure thrown away. There will be no peace from the advertiser if he be not in some way restrained, or the world come to a sounder judgment than is the case at present, on the necessary excellence of advertised goods.

Plumbers and others will regret to learn that another attempt to "corner" the tin trade seems to have been temporarily successful, notwithstanding the ignominious failure of the syndicate which engineered the "corner" in tin during the years 1887-8, when the price was manœuvred up to £170 per ton, and the complete collapse of the Société des Métaux a few months later, brought about by their unfortunate speculation in copper. Already it is asserted in some quarters that French and Dutch speculators hold about 16,000 tons; but as this represents almost the whole of the European supply, which at the end of August amounted to 16,926 tons, such figures are not credited, the quantity being thought to be nearer 12,000 tons. The low price to which the metal had fallen (£65 17s. 6d. being touched in July) seems to have been the main inducement for the syndicate's embarcation in the speculation. Under the influence of their purchases, the value of the metal has been raised about £6 per ton, which roundly represents an appreciation in the metal in sight of some £120,000, and there is no doubt that if they could get out of their holdings at the present price they would make a nice little "scoop"; but the difficulty is to find buyers. Whatever the trade may do, so far there has been little inducement for them to buy tin, no appreciable improvement in the demand for tinplates having yet occurred, and, as they are not likely to find willing purchasers for their holdings among the wily group who assemble in the Metal Exchange, they are at present in possession of something which very much resembles a white elephant.

At the closing meeting of the Trades Union Congress at Norwich, held on Friday, Mr. Benjamin Turner, of Batley, moved, as a result of a conference of the delegates who had motions on the subject of the Factory Act, "That this Congress instructs the Parliamentary Committee to introduce a Bill, at the earliest possible opportunity, to amend the Factory and Workshop Acts of 1878 and 1891." Mr. Walker, London, moved the addition of words to bring about the abolition of domestic workshops, and these being accepted, the resolution was unanimously adopted.

At the same meeting the following resolution was unanimously passed: "That in all Government building contracts a clause be inserted prohibiting any contractor or other persons sub-letting any of the stonework or masonry, or brickwork, carpentry, plastering, painting, or ground work; and that all the above-named work be executed or done within the jurisdiction of such trade or loyal rules of the district wherein such building is being built, altered, or repaired, and to pay the trade union rate of wage and work to the trade union hours of such trade or local rules. Any contractor found violating any of the above conditions to be fined £500, and to forfeit his contract."

Dr. Ernest Hart's paper, read at the International Hygienic Congress, seems to have been one of the most important and interesting of the essays submitted. Dr. Hart's theme was cholera, and he dwelt with emphasis on the frequency with which contaminated water is responsible for the spread of disease. During the epidemic of 1853-54 in London, the foul water drawn from the Broad-street pump caused the death of 22 persons out of every 1,000 living in the parish of St. James's, Westminster. The outbreak of cholera in Hamburg in 1892 was marked by 18,000 cases and 8,000 deaths clearly traced to the polluted Elbe water. Dr. Hart's doctrine of water-borne cholera is also applicable to other disorders. It should awaken municipalities, and London especially, to the most vital question of securing and maintaining a constant supply of drinking water free from impurities.

At the last meeting of the Bristol Association of Clerks of Works and Builders' Foremen Mr. Read opened a discussion on the appearance and characteristics of building stones, and pointed out the qualities that are necessary to insure a good material for building or other work. In the discussion that followed, Mr. Cawsey maintained that wind considerably enhances the durability of stone by drying out the moisture, and thus assisting its lasting powers, and Mr. Pike pointed out that no stone intended for the exterior of a building should have a porous surface, as otherwise the rain conducted the acids from the atmosphere into the pores of the stone, which soon became decomposed.

I have received the syllabus of day classes and the studio in connection with architecture and building construction held at King's College, under Professor Banister Fletcher, F.R.I.B.A. The day classes are fixed at a late hour in the afternoon to enable architects' pupils, improvers, and other students to attend, so as to interfere as little as possible with office work. The studio under Mr. Banister F. Fletcher, A.R.I.B.A., is open every evening. The student in the first year is instructed in the elementary course, in the second year the more advanced, and the third year completes the subject, so as to assist those preparing for the Institute progressive examinations. The fees are moderate. Evening classes are also held for the convenience of those who cannot attend during the day. I would advise all pupils and students who are desirous of improving their knowledge of the profession to avail themselves of these classes, and to write for the syllabus of lectures, terms, and fees.

Messrs. Hayward Brothers and Eckstein, of Union-street, Borough, S.E., have issued a new catalogue of the "Safford Radiators," which are applicable to hot water and steam. The "Safford" radiator is an improvement on ordinary appliances of this sort; it is constructed with right and left screwed nipple connections, with large, clear waterway. No bolts, packing, or gaskets are used, and there is nothing to get out of repair as in the ordinary kind. The "Safford" radiator is made in various plain and ornamental patterns, and it is a very convenient form for decorating, as it can be finished by a combination of different-coloured bronzes. Directions for decoration are given. Sectional views of the hot-water and steam radiator loops are shown. Each loop is tested to a pressure of 120lb. to the square inch, and the radiator is guaranteed against the possibility of leaky joints. By the right and left screw nipple system each loop is drawn face to face, iron to iron, and held firmly without the use of red lead or any other substance; the nipple makes a perfect joint. There are also no bolts or packing necessary. The "Favourite" and "Perfect" patterns are made in various heights —$26\frac{1}{2}$in., $32\frac{1}{2}$in., $38\frac{1}{2}$in., 26in., 32in., and 38in., with single or double loops, giving a width of 5in., $7\frac{1}{4}$in., and 8in. respectively. The flow and return openings are tapped for $1\frac{1}{4}$in. tube. The "Perfect" pattern is plain, and has a heating surface of $46\frac{2}{3}$sq.ft., the price being about £4 4s. The "Favourite" pattern double-loop radiator with twelve loops has a heating surface of 80sq.ft., and is suitable for public as well as private buildings. We believe the "Safford" screw-nipple radiators and the "Daisy Independent" hot-water boilers combine the merits of durability and efficiency. The catalogue gives illustrated descriptions, sizes, and prices for each of these useful inventions, and a form of specification. These radiators are being specified in many first-class buildings, and are worth the attention of all architects.

CHIPS.

The Marquess of Lansdowne and Sir Charles Tennant have been appointed to succeed the late Sir H. R. Layard and Viscount Hardinge as trustees of the National Gallery.

In the case of Henry John Bracher, of Boscombe, near Bournemouth, builder, the bankrupt's application for discharge from bankruptcy has been adjourned for ten years.

The town council of Longton, Staffs, have decided to apply to the Local Government Board for sanction to borrow £2,800 for street improvements.

The winter's course of free museum lectures at Owens College, Manchester, will be given on Saturday afternoons at 3.30, beginning October 13, when Professor Dawkins will discourse upon "The Palæolithic Age," and the following Saturdays upon "The Neolithic Age" and "The Contact with History."

Mr. Basil P. Ellis will occupy the chair at the annual dinner in aid of the funds of the Builders' Benevolent Institution, to be held at Carpenters' Hall, on Thursday, November 15th.

The York school board have instructed Messrs. Demaine and Brierley of that city, to prepare plans and designs for a school to accommodate 1,500 children to be built on Scarcroft Common.

The Local Government Board have given their consent to the borrowing by the Bristol corporation of £37,500 for the purpose of laying down wood paving.

A bazaar in aid of the funds for restoring the spire of Weobley parish church was held at Carnstone Castle, near that town, on Thursday and Friday last. The dilapidated condition of the spire, which rises from the midst of four pinnacles at the top of a substantial looking square tower, has long been a subject of remark. Plans have been prepared by Messrs. G. F. Bodley, A.R.A., and Garner, and the work of restoration has been intrusted to Mr. George Ket, of Cambridge. The cost is estimated at about £1,500.

The new gymnasium, Rydal Mount School, Colwyn Bay, for Mr. J. G. Osborn, M.A., J.P., is being erected from the designs and under the superintendence of Mr. T. E. Lidiard James, F.R.I.B.A., 27, Chancery-lane, London, architect to the school, the builder being Mr. J. B. Jones, of Colwyn Bay.

The city council of Glasgow have adopted a report by the deputation of four who visited London, Amiens, and Paris for the purpose of making inquiries into the question of the decoration of the banqueting hall of the Municipal Buildings. The principal conclusion of the deputation was that "to execute great decorative works the co-operation of great artists is indispensable," and a scheme of decoration is now being drawn up by Mr. W. Leiper, A.R.S.A., a Glasgow architect. It is intended that the whole work of the decoration shall be carried out by Glasgow artists. There is still a sum of £20,000 which the committee have at their disposal to decorate the present buildings.

Colonel J. O. Hasted held an inquiry at the Watford Local Board offices, on Thursday in last week, with reference to an application to the Local Government Board by the Watford local board for sanction to borrow £1,000 for carrying out sewerage works, and for £1,000 for water supply for Watford. Mr. Waterhouse, the engineer, produced and explained the plans.

The foundation-stone of a new bridge was laid at Chapel Lawn, near Clan, Salop, last week. Mr. A. Hamer, of Bishop's Castle, is the engineer, and Mr. Herbert Jukes, of Craven Arms, the contractor.

At Bridge of Weir, Renfrewshire, Sir Wm. Arrol laid yesterday the memorial stone of the first of a series of buildings to be used as a hospital for the treatment and cure of consumption. The author of the scheme is Mr. William Quarrier, the founder of the Orphan Homes of Scotland, and the site selected is in the vicinity of these homes. The total cost is estimated at from £50,000 to £60,000.

Building Intelligence.

Cheltenham.—The newly-erected passenger station at the Great Western Railway Company's terminus in St. James's-square, Cheltenham, was brought into use for the first time on Sunday. The site is nearly three times larger than that of the space occupied by the old station. The station is an open one—that is to say, it is not roofed in, though the platforms for their entire length are covered. The entrance to the booking office, which faces the Roman Catholic Church, is approached by a wide covered way. In the front part of the building are the parcels-office and cloakroom. There are four large waiting-rooms on the departure platform. In addition to the two large platforms for ordinary inward and outward traffic, there is a side platform for the branch trains on the Cheltenham and Banbury line, which also has its terminus at Cheltenham. The station is built of red brick with blue brick decorations. It was designed by the company's architect, and the contract was let to Mr. C. A. Horton, of Brierley Hill. The total cost, inclusive of ground, is estimated at about £50,000.

Lichfield Cathedral.—The Dean of Lichfield, speaking at a civic banquet in that city on Saturday, said that the restoration of the cathedral was proceeding satisfactorily. The renovation of the central tower was completed, and the transepts were nearly finished. Mr. Heywood Lonsdale had given £1,000 to restore the south transept window, just as the late Mr. James Chadwick, of Manchester and Lichfield, gave £1,500 for the north transept window. The ladies of the diocese had subscribed £1,200 for decorating the Lady-chapel, and it was intended to erect a new reredos, to fill the ten vacant niches at the east end with alabaster statues, and to make all the nine stained-glass windows in the Lady-chapel to correspond. In this connection there was a remarkable coincidence. Ninety years ago there was found, stowed away in a Belgian barn, some of the finest stained glass in the world, and with this seven of the windows in the Lady-chapel were filled. Recently some similar glass, about 350 years old, was discovered in a London cellar, where it had been hidden for fifty years. This glass also had been secured for Lichfield Cathedral, and would be placed in the other two windows of the Lady Chapel, which at present were filled with unspeakably bad glass.

Newport, Mon.—The Belle Vue Park, the gift of Lord Tredegar to the borough of Newport, Mon., was formally opened on Saturday. It is situated on a hillside above Newport, and commands a magnificent view of the lower part of the town, the docks, and rivers Severn, Usk, and Ebbw, while beyond may be seen the Quantock and Mendip hills in Somerset, and the rounded masses of Exmoor capped by Dunkerry Beacon. The park is 23 acres in extent, and is approached by four entrances, the principal lodge, of Elizabethan character, carried out in local stone with red tiled roof, being on the Cardiff-road. Four terraces, each holding 3,000 to 4,000 visitors, have been made on as many levels, communicating with each other by broad flights of stone steps. The pavilion has a central hall 36ft. high and 100ft. by 60ft., and is flanked on either side by conservatories, 30ft. square and 26ft. in height, and a series of dells, pools, and cascades wind for a length of 400ft. Near Francis-road is a large circular fountain. Twenty thousand pounds has been expended on laying out the grounds, under the direction of Mr. T. H. Mawson, garden architect, of Windermere and Market Drayton, who has on hand at present no fewer than seven parks in different parts of the country. The fences and heating of the conservatories have been supplied by Messrs. W. A. Baker and Co., Newport; the boundary walls are the work of Mr. J. H. Firbank, Newport; the lodges, terraces, and pavilion are by Mr. Dyson Parfitt, Newport; the conservatories, bandstand, and greenhouses by Messrs. Richardson and Co., Darlington; the fountain, Mr. Davis, sculptor, Newport; the wrought-iron gates, Messrs. Brawn and Co., Birmingham.

Wragby.—A new Wesleyan church was opened on the 6th inst. It is 44ft. 6in. by 24ft. inside, and seats 174 adults, or a mixed congregation of 225 persons. The schoolroom is 30ft. by 20ft., besides which, there are two classrooms, the whole capable of seating 150 scholars. The school is placed at right angles to the church, and opens into it, and will add seating accommodation for 100 more people to the congregation. At the rear end of the church there are a chancel and organ-chamber, separated from the nave by moulded arches. There is also a preacher's vestry, with lavatory, &c. The church gable has three lancet-headed windows, the middle one being of two-lights, with Geometrical tracery in the head. The roof of the church is partly open, with wrought timbers and arches and pitchpine ceiling. The fitting of the church is in pitch pine, with a handsome pulpit, also of pitch pine. The glazing throughout is in cathedral-tinted glass. The building throughout is brick, with stone dressings, and it is heated with hot water. The cost has been about £1,400. The architect is Mr. J. Wills, of Derby, and the builders were Messrs. J. M. Thompson and Sons, of Louth.

CHIPS.

Considerable alarm has been occasioned in Castleford by the bursting of the water reservoir. Within the past week the whole of the water in the reservoir, estimated at between 15,000 and 20,000 tons, has mysteriously disappeared. Investigation disclosed a crack at the bottom, through which the water had evidently rushed, and had found its way into the old workings of the pits or sandholes which abound immediately under the site of the reservoir. A similar incident happened a few years ago.

At Stone, Staffordshire, works of sewage purification are about to be carried out for the local board, from plans by Mr. Theo. S. McCallum, A.M.Inst.C.E., Chapel-walk, Manchester, who is also the engineer for similar works to be carried out for the local board of Longridge, near Preston.

The death took place on Thursday in last week of Mr. Robert Greenlees, R.S.W., at his residence, 150, Hill-street, Glasgow, at the age of 74 years. Mr. Greenlees was a well-known landscape painter in his day, and a frequent exhibitor between 1870 and 1880 in the Royal Academy. He was perhaps best known as a teacher of painting. For many years he was headmaster of the Government School of Art at Glasgow, and in this position exercised for a time an important influence on West of Scotland art. He is survived by two daughters, one of whom is Mrs. Wylie, a well-known lady artist.

Mr. John Cassidy, sculptor, Manchester, has completed the marble statue of the late Mr. John Rylands, upon which he has been engaged for eighteen months past. It will shortly be placed in the position it is to occupy in the building now being erected in Deansgate for the John Rylands Library, from plans by Mr. Basil Champneys. The building itself is still far from completion.

It is stated that the Council of the Librarians' Association will, in response to Dr. Garnett's suggestion at their recent meeting in Ireland, draft a Bill for the protection of libraries from actions for libel.

The Carnarvon Bay Hotel, Dinas Dinlle, a rising seaside resort near Carnarvon, has been sold by auction to a London firm, who are also negotiating for the purchase of lands in the vicinity of the hotel for the erection of villa and other residences—a long-felt want.

Mr. J. Douglass Mathews, C.C., of 11, Dowgate-hill, is the architect for the erection of an additional story and other alterations at the vestry hall, Upper-street, Islington.

The foundation stone was laid of the Pinet Memorial School, in connection with the Roman Catholic Church of St. Mary on the Mount, Richmond Hill, Leeds, on Sunday. It will accommodate 475 infants. The cost is to be £2,000, exclusive of furnishing. The new infant-school will be 60ft. by 30ft., and 24ft. high. There will be two class-rooms, each 24ft. by 23ft., a separate babies' room, 30ft. by 28ft., and cloak-rooms and lavatories.

The Scarborough Town Council decided on Monday night that proceedings be taken forthwith for obtaining the consent of the owners and ratepayers of the borough to borrowing £70,000 for the construction of a marine drive and sea-wall round the foot of the Castle Hill.

In the current half-year the Midland Railway Company contemplate expending £650,000 upon new works, the London and North-Western Railway Company £478,000, and the Great Western Company £250,000.

The work of relaying the existing line of tramways at Newport, Mon., is almost completed. This will bring the older portion into connection with the new section in High-street, which is laid in wooden blocks. On the relaid portion granite sets are used. The old rails of iron are replaced by new ones of steel, bedded on a concrete foundation. Messrs. Krauss, of Bristol, have the contract well in hand.

Engineering Notes.

The M.S. and L. Railway Extension to London.—Another important step towards the construction of the Manchester, Sheffield, and Lincolnshire Railway Company's extension from Chesterfield to London was made on Friday, when several of the more important tenders were accepted. Messrs. Logan and Hemmingway have been intrusted with the construction of the first 20 miles from Chesterfield towards the south; Mr. Lovatt, of Wolverhampton, with the section from Loughborough to Ayleston, Leicester, and Messrs. Topham and Co., of London, with the section from Ayleston to Rugby, and Mr. John Jackson, of London and Newcastle-on-Tyne, with the seventh and shortest, but most costly section, that from Hampstead to Edgware-road. The total length of the railway is 112 miles, and it is estimated to cost 6½ millions sterling.

ARCHÆOLOGICAL.

The Roman Wall.—The examination of Hadrian's Wall, promoted by the Cumberland and Northumberland antiquaries, in conjunction with Professor Pelham and Mr. F. Haverfield, was carried on actively in both counties until the end of August, when the Cumberland excavations were suspended. Sections were cut in the vallum at various places, especially at Brunstock, Whitemoss, Lanercost, and Greatchesters, with the result that its general system was laid open, and it was made plain that the mounds of this great earthwork were mainly excavated from its central ditch. Sections cut from the wall to the vallum showed the Roman military road in good preservation, and revealed also a paved footpath close behind the wall. Of the "Gromatie ditch," so noticeable on the German limes, no certain traces were found, either in front of the vallum or in front of the wall. At Greatchesters (Æsica) the excavators attacked the south-west angle of the Roman fortress, and unearthed a turret and several buildings of uncertain use, and ascertained further that the occupation of the camp had been once or twice interrupted, as was the case apparently with other camps along the Roman wall.

The new chapel, built by the Wesleyans of Summer Bridge, in the Pateley Bridge Circuit, was opened on Friday by the president of the conference. The chapel, which is to seat about 300 people, is in the Gothic style, and has a spire 70ft. high. At right-angles to the chapel is a schoolroom, separated by a screen of wood and glass, so arranged that it can be thrown into the larger building.

Two schemes are announced for proceeding with the works for making a canal through the Isthmus of Panama. One is being promoted in New York, and its principal feature is to create a lake, twenty-four miles long, at Culabra, which will receive the overflow of the Chagres River. The other consists of the formation of a new company in Paris, with the assistance of the liquidator of the old company, and for this the promoters ask, to commence with, a subscription of twenty millions of francs. Col. Reves, the chief inspector of the Panama Railway, believes that the works can be completed for five hundred million francs, and several thousand workmen have made their way to the isthmus and await the resumption of the works.

The annual general meeting of the Incorporated Institute of Architects of New South Wales was held last month at the room in O'Connell-street, Sydney. The President, Mr. J. Horbury Hunt, was in the chair. The following were elected office-bearers for the ensuing year:—President, Mr. J. Horbury Hunt, F.R.I.B.A., Hon. Mem. A.I.A.; vice-president, Mr. J. B. Barlow; hon. secretary, Mr. J. J. Davey; hon. treasurer, Mr. J. M'Donald; members of Council, Messrs. W. G. Coward, W. Kenwood, T. Rowe, A. Thornley, and H. A. Wilshire.

The chairman of the Barton Board of Guardians formally opened the first portion of the new workhouse at Patricroft, near Manchester. The total cost of the buildings, exclusive of the land and properties, is £20,000. The site, including that of the old workhouse, covers an area of over six acres. The new workhouse, when completed, will afford accommodation for about 500 inmates. The section already completed comprise the administrative block, the wards for the aged, infirm, and able-bodied inmates, and the tramp wards. The old workhouse is to be transformed into a temporary hospital. Messrs. Maugnall and Littlewoods, of Manchester, are the architects.

COMPETITIONS.

Cleethorpes.—The committee, with the assistance of a professional assessor, have, after careful consideration of the 39 sets of designs submitted in open competition for the new Public Hall and Club, unanimously awarded the premiums as follows: 1st, Mr. John R. Withers, St. Mary's Court, Shrewsbury; 2nd, Mr. Solomon Ford, 3, Queen-street, Cheapside, London, E.C.; 3rd, Mr. J. Mitchell Bottomley, 28, Albert-road, Middlesbrough. The committee have already met and instructed Mr. Withers to prepare working drawings for the carrying out of the work.

Kirkcaldy.—At the last meeting of the town council a report of a joint meeting of the Beveridge Hall and Library Committee, and the Adam Smith Hall Committee, was submitted, stating that a report had been received from Mr. Gillespie upon the plans for the Beveridge Hall and Library and Adam Smith Hall. The committees recommended the council not to accept any of the plans, on the ground that Mr. Gillespie advised that they could not be executed for the sum authorised by the conditions of the competition. An amendment, that a sub-committee be appointed to go over the eight selected plans referred to in Mr. Gillespie's report, and to report (1) how many of these admittedly exceed the cost prescribed by the conditions; and (2) the order of merit of those which the architects claim can be erected for the money, the remainder of the whole plans to be returned at once, was lost in committee by the Provost's casting vote. The clerk now read the written opinion of Mr. Gillespie, which was to the effect that none of the plans could be carried out for the money stipulated, and he therefore advised that the competition be null and void. After some discussion it was decided to revert the matter back to the committee to see which of the plans should be selected, and if the author guaranteed that it could be carried out for the price stipulated, then they should go on.

"Owen Jones" Prize.—This competition was instituted in 1878 by the council of the Society of Arts, as trustees of the sum of £400, presented to them by the Owen Jones Memorial Committee, being the balance of subscriptions to that fund, upon condition of their expending the interest thereof in prizes to "students of the School of Art who, in actual competition, produce the best designs for household furniture, carpets, wallpapers and hangings, damask, chintzes, &c., regulated by the principles laid down by Owen Jones." The prizes are awarded on the results of the annual competition of the Science and Art Department. Six prizes were offered for competition in the present year, each prize consisting of a bound copy of Owen Jones's "Principles of Design" and a bronze medal. The following is a list of the successful candidates:—Fred Appleyard, School of Art, Scarborough (design for wall-paper); Ernest G. Gillick, School of Art, Nottingham (design for lace curtain); Ernest G. Slater, School of Art, Scarborough (design for a damask); Constance T. Smith, School of Art, Glasgow (design for a printed velvet); Edwin Francis, School of Art, Durham (design for a carpet); Samuel Palmer, School of Art, Macclesfield (design for floor tiles). The next award will be made in 1895, when six prizes will be offered for competition.

Wandsworth.—We have more than once referred to the select competition which was held about three years ago under the auspices of the Middlesex County Council for a new asylum for idiots at Wandsworth, and the contest obtained some interest by reason of the fact that a protest against the award was lodged at the time by the whole of the rejected architects, who protested against the decision because, among other reasons, the limits of cost set forth in the instructions had been manifestly ignored. £30,000 was the amount fixed for the competition; but subsequently the County Council, after about two years' delay, agreed to spend £40,000 on the buildings. Working drawings were then prepared, and we understand that tenders have been obtained; but the amounts, so far as we know, have not been made public. We now hear, however, from the architects, Messrs. Stock, Page, and Stock, the authors of the design which was chosen, that the visiting committee of the asylum has declined to carry out their plans for this building.

Wednesfield.—A meeting of the school board was held on Saturday at Heath Town, to decide the competition of plans for a new board school at Wednesfield. A report was read from Mr. E. R. Robson, consulting architect to the education department, who acted as referee, showing that a plan marked "Creon," sent by Mr. T. H. Fleeming, of Wolverhampton, was first, and "Compact," by Mr. H. Farmer, of Darlaston, was second. Mr. Fleeming's plan was adopted. The other competitors included Messrs. Stanger, Veall, Lavender, R. Rowe, F. Bate, and J. H. Gibbons.

◆

CHIPS.

The scheme proposed by Mr. James F. Reade, A.M.I.C.E., London, for the supply of water to Kilkenny, has been accepted by the corporation of that city. Fourteen schemes were submitted, but the names of the other competitors have not been published, as the terms of the competition were strictly secret. The estimated cost is £21,500.

The Earl and Countess Derby opened on Wednesday a new park at Ormskirk. The site, which is two acres in extent, was presented by the late Earl, and the land was laid out by the labour of miners during the recent strike.

At Monday night's meeting of Alloa Burgh Commisioners a letter was read from Mr. John Thomson Paton, of Norwood (the donor of the Alloa Town Hall and Public Library), offering to erect and equip a set of baths for the public, together with a gymnasium and some furnished rooms for conversation and amusement. Mr. Paton further offers the sum of £3,000 as an endowment towards the maintenance of the establishment. It was unanimously agreed to accept the gift.

The Secretary for Scotland has approved of the Ayr Town Council borrowing £15,000 for the installation of the electric light.

The local board of Farsley adopted, on Monday, a scheme by Mr. B. Walker, C.E., of Bradford, for the sewering of the board's district.

Mr. T. Mason, of Hebden Bridge, Manchester, contractor for the new drain from James-street to Chequergate, died on Thursday week through rupturing a blood-vessel. Mr. Mason was taking part in the drainage works some few weeks ago, and strained himself in lifting a heavy drain-tile.

Mr. Peter Carter Brownell, of Hazelcroft, Alderley Edge, Cheshire, who died on July 15, has bequeathed his painting of "The Horsepond," by Mr. C. E. Johnson, a native of Stockport, to his wife for life and then to the Stockport Corporation Technical School, free of legacy duty.

On Saturday the foundation-stone of a new Congregational mission church and schools was laid at the corner of Hainton-street and Welholme-road, Grimsby. Mr. Henry S. Scaping, of Grimsby, is the architect, and Messrs. J. M. Thompson and Sons, of the same town, are the builders. The church will comprise a nave 59ft. long and 31ft. wide, with transepts 12ft. 6in. by 10ft. each. There will also be three classrooms on either side of the nave.

The French School of Archæology at Athens propose to excavate the site of the Temple of Athené Alea at Tegae. The sculptures of this building were by Scopas, and a few fragments brought years ago to Athens are the best data we possess for judging of the style of that sculptor.

The town council of Conway have applied to the Local Government Board for sanction to borrow the sums of £1,500 and £2,500 for works of water and gas supply respectively, and have also adopted plans submitted by the surveyor, Mr. Farrington, C.E., for the sewering of Gyffin district and part of Conway, at an estimated cost of £800.

The will of Mr. Julian Arthur Lumley, of 5, Davies-street, Berkeley-square, and 35, St. James's-street, auctioneer and surveyor, who died at Boay on the 17th July last, has been proved; the gross value of the personal estate being £1,353 17s. 4d., and the net value £108 10s. 10d.

A return has been issued of the most serious accidents which occurred during the construction of the Tower Bridge. The total number was 29. Of these 10 were fatal, the verdict in 9 cases being accidental death, and in other instance deceased's negligence. The numbers of men employed at any one time in the construction of the bridge varied between 76 in July, 1886, and 848 in December, 1892. The average for the whole period from June, 1886, to July, 1894, was 432.

The city council of Winchester have elected, from among the 163 candidates who competed for the appointment, Mr. Archibald Henry Jennings as clerk in the borough surveyor's office.

The Gobelins Tapestry Works in Paris have just finished several new works, destined for the enrichment of the foyers of the Comédie Française. They represent scenes from Voltaire's "Zaïre," Racine's "Iphigenie," Molière's "Misanthrope," and Victor Hugo's "Hernani."

Correspondence.

SHOULD ARCHITECTS ADVERTISE?

To the Editor of the Building News.

Sir,—Awaiting the opinions of your readers on the letter under this heading, I inclose an advertisement cut out of a paper which circulates largely among publicans.

MESSRS. DEAR AND WINDER, ARCHITECTS, 119, GREAT RUSSELL-STREET, BLOOMSBURY, having devoted many years to studying the requirements of the Trade, prepare Plans and HIGH-CLASS DESIGNS for Modernising or REBUILDING Licensed Properties. Highest references to Brewers and the Trade generally.

—I am, &c. Observer.

SEWER AIR AND ITS RELATION TO ZYMOTIC DISEASE.

Sir,—Mr. Reeves's investigations of the above subject given in Building News, August 30, adds materially in many respects to the weight of evidence accumulating fast, that zymotic influence originates "in as yet" obscure organic reactions which a putrefactive fermentation of sewage in conjunction with a variable operation of the principles, time, temperature, and air supply in nature, apparently combine to produce; but we have no actual proof, and the fact vitiates all theoretic conclusions regarding a subject on which, from every point of view, an actual demonstration of "the facts involved" is so much to be desired.

Short of actual demonstration, the evidences in favour of the theory is weighty, for in 1892 we find an official inquiry by the M.D.S.G.B. attributing influenza principally to the presence of refractory organic impurities in the air. A year later, at the B.A. Congress, we find Dr. Frankland, F.R.S., advancing the conclusion that many toxic forms—cholera, typhus, diphtheria bacilli—"have pseudo-forms," and that "in certain cases" the pathogenic modification may be due to the exclusion or exhaustion of oxygen, and that, assuming fermentation in presence of air to be normal, a "modified reaction" can apparently proceed when no more oxygen is at disposal. Here we find the results of the most accomplished investigation apparently in close accord with specific details which Mr. Reeves describes. Again, Sir Charles Cameron, in a recent address to the B.M.A. at Bristol, said: "As regards typhoid fever, I have no doubt that local epidemics of this disease are frequently caused by infected water and milk; but I believe the greater number of cases arises from the materia morti of the disease being absorbed from the air." It will, I think, be conceded that, short of actual demonstration of the facts, we find in conclusions quoted ample evidence that many forms of epidemic with which we are too familiar find first cause or origin in organic reactions in the air.

On the other hand, Lord Salisbury, speaking on analogous subjects at Oxford, drew attention to the danger of accepting "conjectural evidence" in substitution for the knowledge to be acquired only by demonstration of theory in detail. This criticism equally applies to a *de novo* theory of infection as to sewer conditions, especially if the latter are based on the theory that by aërification the nature of the fermentation in sewage may be controlled. This theory was, I believe, first advanced by Dr. Angell in a well-known address on sewage disposal to the I.C.E. in 1888. At best it represents a half-truth, proved by the actual results attending "a very practical test" of the facts involved. Did space permit, I would give details of this experiment (which occurred several months previous to Dr. Angell's address), which, as far as practicable, was made analogous to the sewer itself; except that, as regards the operation or influence of both time and air supply, the conditions "were wholly favourable" to a normal course, and although the result failed to control the fermentation beyond "a certain limit," and proved that no conceivable aërification of London sewerage "under present conditions" would, or could, control or prevent formation of dangerous gases, yet phenomena were disclosed in this experiment which point clearly to the procedure required, and also to means by which an actual demonstration of the facts involved in sewer air may be obtained. The increase of diphtheria conditions in districts to which Mr. Reeves refers offers an opportunity to test the facts, and should Mr. Reeves be desirous of proving the truth of conclusions he so ably advances, all information at my command is entirely at his service.—I am, &c.,

Hill-Hartland.

728, Grimesthorpe-road, Sheffield, Sept. 8.

ASSISTANT SURVEYORS, WAR OFFICE.

Sir,—Will you allow me to add my views to those of your other correspondents on this subject?

To "An Old R.E.D. Servant" I would reply: The country may not care one iota who does the work of the R.E., or any other department; but this is no argument in favour of a system which is destructive of all zeal, and has every tendency to make the best man careless. Credit should be given to those to whom credit is due, and, as far as I can see, there is no valid reason why the R.E. surveyor should not be officially and publicly identified with the work he performs, in the same manner that professional men in other public departments are recognised in connection with their particular duties. Is there any other branch of the public service, whether civil, naval, or military, where the work of professional men is appropriated as their own by others who are not even qualified to assist in its preparation? "Balbus" is altogether too modest, and evidently unfitted for leadership; but is this a reason for suggesting that there are not among the Civil staff men well qualified to officiate as the professional head of an Army Works Department with dignity and ability equal to that, say, of the Army Medical or Veterinary Departments?

Now for this vexed social question. It is all very well for those of the Civil Staff who are fortunate enough to be stationed at large headquarter stations at home, where the civil population greatly outnumbers the military element, to affect to ignore this question. Here the influence of the military on society is confined within, comparatively speaking, small limits, and there is little difficulty in making a few friends among the professional families of the district—providing the surveyor stays long enough — apart and removed from all military influence.

But at small country stations at home, or at stations abroad, these conditions are exactly reversed, and the military here to a very large extent control and influence the society of the neighbourhood. Now an engineer or architect in private practice in such a district has a status which is well defined and understood; but a surveyor of the War Department loses his professional status, and in lieu thereof is given that of a departmental officer of the army. This position he would take as a matter of course if he wère in charge of the works branch apart and entirely separated from the Royal Engineers, and he would even now enjoy the privileges attaching to such a position; but—and a very large, *but*, too, if you please, Mr. Editor—for the demeanour of the Royal Engineers, whether in the office or elsewhere. The attitude adopted towards the surveyor, and his family if married, by the Royal Engineer officer with whom he may be serving, in a small district such as I have described, must largely influence for good or bad the other officers of the garrison, their families, and the civil professional families in the neighbourhood. The utter indifference displayed by the majority of the officers R.E. in social matters affecting the civil staff, is such as creates the impression in the minds of others that the surveyor is a civilian of inferior grade, and comparable with the civil subordinates of his own and other army departments. Let the Royal Engineers evince some desire to assist the civil staff in their difficult and anomalous position in the service, and this grievance at least would soon be remedied; if the surveyor cannot look to the Royal Engineers for assistance, to whom is he to look? It must not be lost sight of when considering this question that at some stations at home, and nearly, if not all, stations abroad, the surveyor lives in military quarters within the garrison; this is the reason why military society is in many cases essential to his comfort; it is not the supposed glamour of the life which attracts him, but the necessity which drives him to it. "An Old R.E.D. Servant" perhaps never experienced the drawbacks and misconception of living as a civilian in a military garrison. He may have been fortunate enough to have escaped foreign service; or it may be that long years spent at the War Office towards the close of his official career have dulled his memory, and he is therefore unable to sympathise with the young R.E. servant who is yet on the first stage of the road of his official life.

"A Commissioned Officer," in referring to the Pay Department as clerks, and the Army Service Corps as shopkeepers, alluded only, I presume, to the nature of their ordinary duties. There is no denying the fact that the duties of the Civil Staff R.E. are as closely related to the army as the medical, pay, and other departments in peace times. As their duties lie almost exclusively within the barracks or fortifications, they should have the same protection, and be sure of receiving the same respect and consideration when moving about barracks, &c., which is shown to all other officers of army departments. As it is, the surveyor is frequently disrespectfully questioned and interfered with when on duty, and this acts as a great deterrent to those who would gladly take more interest in their work, could it be performed under more agreeable conditions.

It is really difficult to understand what "Balbus" means by his reference to *retirement*—what is wanted is *prospect of promotion*. How does Mr. Bowden's retirement affect promotion, and of what good is it if two or three, or even a dozen, of the senior surveyors do retire if the vacancies are not filled up? Cannot "Balbus" be induced to write just once more and give us some idea as to in what year and at what age the assistant serveyors who entered the service since 1889 may expect to get promoted to the 2nd class, and when, if at all, they are likely to realise the £500 per annum which they were led to understand there was a *prospect* of attaining?

In conclusion, it is the vagueness of the regulations which are supposed to define the status of the civil staff, the inferiority of the relative rank conferred upon them as compared with other professional men in the army, the utter indifference displayed by the Royal Engineers in all matters affecting the staff, whether official or social, the want of proper identification with the work of the department, and the reduction of the number of senior appointments, and the complete block in promotion that must soon occur, which make dissatisfaction so general in the staff.—I am, &c.,

Mars.

ASSISTANT SURVEYORS, WAR OFFICE.

Sir,—I commenced this correspondence with the object of warning candidates of what they must look forward to. "Balbus" fully bears out what I have said, and endeavours to penetrate my identity. My answer to him is, that he has the same trick as Mr. Elton, of last year's correspondence, of making himself a mouthpiece of the staff. After what he has written, I am confident that his *confrères*, both senior and junior, will heartily wish him out of it, as his twaddle and servility are quite sufficient to deter "*the best men—the men we want*" from entering the department. He admits that he is in favour of dismissing R.E. officers to their proper duties. Then, seeing this necessity, why does he not propose a solution of the question?

The preceding paragraphs on page 270, which he refers to, point out an abuse in connection with buildings erected for the United States Treasury, and that a Bill is being introduced to mitigate it by obtaining plans, &c., through a system of competition among private architects. This is what I advocate. Limited competition among architects of the districts where the schemes are to be carried out would obviate his helter-skelter, and architectural assessors could be found, notwithstanding his diseased imagination.

He forgets Mr. Ingress Bell affects his grievance No. 2, and that it was understood his appointment would not interfere with the promotion of other surveyors.

He may call his diagram by any other name he likes; but let him not dabble in actuarial terms, such as life-history. He said my calculations were pessimistic, and now holds that his diagram pictorially represents what I gave in figures. Retirements will not average three or four per annum, probably not even two.

He had better leave the class question alone. If I find my cousin a colonel in the army and my classfellows amongst its officers, I presume I may consider myself as belonging to their class; in fact, he may ascend to one of the highest officers of the army, and find that his uncle was a bookseller. We are dealing with a practical question, and the self-abasement of "Balbus," who endeavours to drag his fellows down to his own level, can not affect it. Black sheep are found in all classes, but it is unusual for their fellows to herald them.

With regard to "An Old R.E.D. Servant," who values a pension of £300 a year, for a man of 65 years of age, as equal to £7,000—his statement is fit for Bedlam! I have no doubt he found his own level over 30 years ago.

The *Daily News*, 30th ult., in reviewing the report of the Civil Service Commissioners, stated: "For the Royal Military Academy, Woolwich, either the tests are severe, or the aspirants after a military career are indifferent scholars." Perhaps someone can enlighten us on this subject?—I am, &c.,

One Who was In It.

Intercommunication.

QUESTIONS.

[11211.]—**Old Oak Furniture**.—I have some old oak furniture, and in places it has worn whitish, and in other places pieces have been knocked off. Is there any kind of liquid, stain, or process that I could adopt for touching up or doing over entirely a piece of black oak furniture, or how could I renovate? I believe Harry Hems knows how to do what I want!—Old Oak.

[11212.]—**Mensuration**.—Will any reader show me the method of working the following sum:—What is the area of a zone whose greater side measures 72ft., and the less 45ft., and its breadth 19ft. 6in.?—J. P.

[11213.]—**Tall Mill Chimneys.**—Which is the best work on the construction of tall mill chimneys?—F.

[11214.]—**Safe Load.**—What is the greatest safe load the experience of London architects proves piers of good stock bricks well built in stone lime, say eight diameters high, to be capable of sustaining? No two textbooks agree.—J. and B.

REPLIES.

[11204.] — **Weight - Bearing Capabilities of Earth.**—The weight peaty soil will bear greatly depends upon its compactness and dryness. Its spongy nature is likely to cause unequal settlement if built upon, and if your building is adjacent to a road where there is likely to be vehicular traffic, you will perhaps find the vibration will crack the ceilings. I would recommend going down to the gravel (which, you say, is 6ft. from surface) with main walls, and fill in trenches with 3ft. concrete or rubble masonry, then commence footings. This would entirely isolate the inner soil from that outside, and the surface water will have less chance of percolating under footings. The trenches for inside walls need not be taken down to gravel; but they should have a larger bearing area than on ordinary soil. I should say 15cwt. per foot super. would be a safe load on the soil; but you might ascertain the weight it would carry by stacking a cube yard of bricks (equal to 350 stocks) in some convenient form on a bearing surface of 1ft. super. This will give a pressure equal to 1 ton.—W. A. Fryer.

[11206.]—**Churches in Shropshire.**—One of the most important and interesting churches is that of Tong, the date of which goes back to 1411. Besides the Vernon Chapel, with its fan tracery, the carved stall-ends, the screens, and several beautiful altar-tombs are worth study. The aisle screens are of much interest and richness. There are many peculiarities in the details and mouldings, differences of width and detail in the two aisles. The tower is square, terminated by an octagon belfry and low spire. Tong Castle is also of interest. In the vicinity White Ladies' Priory, Boscobel House, Shifnal, are worth visiting. The ruins of Buildwas Abbey, of the Cistercian Order, should be seen, a few miles from Bridgnorth. At Shrewsbury, the castle, the town walls, and churches are of much picturesque beauty. St. Mary's is a fine church, with lofty spire and cruciform plan, of many styles, from Norman to Perpendicular, and possessing several altar-tombs and fine painted-glass windows. It has a fine oaken ceiling delicately carved—one of the best examples in England. A good list of places is given in Murray's "Handbook." Among other churches, I may note Leighton, Borrington, Shifnal, Market Drayton, Minsterley, Knighton, Hadnall, Wem, Albrighton, Donnington.—G. H. G.

[11207.]—**Oak Sills**.—Yellow deal or pine is only used for sills in jerry buildings. As this wood is much lighter in weight than oak, it is naturally more porous. It is not at all durable in our moist climate. Oak sills should be specified, and if grooved on underneath side, with a corresponding groove in stone sill and a galvanised-iron tongue placed in the groove, and set in white lead, there should be no cause to complain of wet driving under.—W. A. Fryer.

[11207.]—**Oak Sills**.—I am quite aware of what "H. L." tells me, that oak sills are used in all good work. My question was "Are oak sills more durable than good yellow deal?" Many large houses have now yellow deal sills because they are not only cheaper but do not warp. What I want to learn is if any experience is forthcoming as to the respective durability. The water bar or metal tongue is of course necessary, but it is the front edge which first decays, a fact known to the painter in repainting. Thanks for Harry Hems' reply.—Builder.

[11209.]—**Fire-Resisting Cement**.—If "E. A. A." wishes to use a composition which will resist great heat, he should use Stourbridge fireclay mixed with water as mortar is.—H. L.

[11210.]—**Lightning Rods**.—The balloon accident at Aldershot should convince Mr. Clayton that it is necessary to conduct the electric fluid to the earth by an efficient conductor.—H. L.

◆

New municipal buildings are being built at Brechin, N.B., from plans by Messrs. D. and J. R. McMillan.

Legal.

PRESCRIPTION AND LIMITATION.

It is curious to find how often the two legal principles of prescription and limitation are confused with one another, although they are, of course, essentially distinct, both in their origin and their application. Prescription deals with the acquisition of a right; limitation only bars a remedy. Each, it is true, depends upon the lapse of certain intervals of time, and the loss of a remedy by one party may practically give a right to another. But to understand the working of the various statutes, it is of importance to grasp the different ideas upon which they are based. The theory of the rule as to prescription is that, by the unchallenged use of the property of another in some way or other, the person so using it for a long time acquires a legal right to go on doing so for ever. In other words, the omission of the person whose property is so used to object to its user for a long period gives a prescriptive right to the person so using it, and confers upon him a legal title in much the same way as if that right had been expressly granted to him. Thus are easements acquired by prescription, and when acquired they become as valid and enforcible as if they were based upon deeds of grant. Formerly the periods necessary to give such a right were vague and uncertain, and the old expression was "from time immemorial, or time whereof the memory of man runneth not to the contrary." That old phrase is quoted at the beginning of the Prescription Act, 1832, 2 and 3 Will. IV. c. 71, which is still the only statute dealing with this matter. That Act gave 20 years as the length of time necessary to acquire a right of light and air by prescription, with 30 years for right of way, and other periods for different easements, and that statute has not been repealed or amended in any particular.

As prescription is intended to give a right which would not otherwise exist, so limitation is meant to take away a right which does exist, and, but for its operation, would continue. At common law there was practically no limitation of action, and so it was created by statute. There are numerous Acts going back to the time of James I.; but the latest statute is that of 1874, which came into operation on 1st January, 1879, and which deals with the limitation of actions relating to land. By that Act, the former period of twenty years, during which an action could have been brought for the recovery of land, was cut down to twelve years—as it now stands—with the result that a twelve years' uninterrupted and hostile possession gives a good holding title to land, though it is not one upon which most people would care to buy. But this reduction of the limitation from twenty years to twelve years has nothing to do with the Prescription Act, which still regulates the periods of time required for the acquisition of rights of easement.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

G. M.—Architect.—Certificate.—Forms.—There are no special forms used or required. Each architect draws them as he likes. Fees are usually chargeable when the works are completed.

Syphax.—Lease.—Drains.—Covenant.—The covenant in this lease seems to cover new drainage, and therefore the original lessee would be liable under it, and so also would the existing assignee; at all events, as far as the assets of the deceased would go. The lease could be forfeited for breach of the covenant by non-payment.

Wolver. — Land. — Restrictive Covenant.—Liability.—You are liable upon your covenant in the deed made with the vendor. But you have a right of active user against your purchaser who bought on the same conditions, for breach of his covenant.

◆

It was reported to the Stockton and Middlesbrough water board on Monday that those towns will be supplied with pure water by the gravitation main now being made from the Hury Reservoir by New Year's Day. Mr. James Mansergh, C.E., is the engineer-in-chief.

At the last meeting of the Bangor Town Council, the city surveyor, Mr. Gill, presented his certificate of the completion of the hospital for infectious diseases, and the members recorded their appreciation of the services rendered by Mr. Gill in superintending the building and keeping the extras on the contract within the amount of £26.

LEGAL INTELLIGENCE.

Builder's Foreman Charged with Fraud.—At Worship-street Police-court, on Monday, William O'Keefe, 35, a builder's foreman, giving his address as Waldegrave-road, Brighton, was brought up on a warrant, charged with fraud. A sworn information set out that the prisoner had been in the employment of a firm of builders engaged in erecting blocks of warehouses at the scene of the recent great fire in Tabernacle-street, Finsbury. He was there as foreman of works, and had power to engage and discharge men. In the usual course, he would make out time-sheets of the hours worked by the men under him, and, there being a large number of men, identification of individuals was difficult. A clerk from the head office went to the works each week to pay the men according to the time-sheets prepared by the prisoner, and in July last another foreman noticed that a man known as "Punch" received money in the name of Martin, and that a man named Steven, who had been discharged on the Thursday, was put down as working up to the Saturday. In consequence of a communication made by that foreman, Steven's demand was disputed, but the prisoner assured the clerk it was all right, and the money was paid. Other sums were paid to the man "Punch" in the name of Green, and after the prisoner had been called on for an explanation, he seemed to have had an interview with the other foreman, to whom he handed a sovereign, saying, "I mean to have some money out of this job, and don't care if I get the 'sack' over it. One job I was at brought me £15 a week." Subsequently, after another pay-day, the prisoner said to the witness, "That came off all right," and handed him 5s. as his share. On the application of the police, the prisoner was remanded, Mr. Corser consenting to accept bail in £100.

Architects' Fees. — Jones v. Morle. — The plaintiff, Mr. J. J. Jones, of 10, Ludon-road, Clapham, sought to recover the sum of 10 guineas for professional services rendered as an architect to the defendant, Mr. W. B. Morle, of 26, Queen Victoria-street. The plaintiff said that he and a Mr. Hunter occasionally did work together as partners. The defendant went to see Mr. Hunter about having some drawings prepared, and then Mr. Hunter handed the defendant over to him (plaintiff). The defendant instructed him to prepare some drawings, which he did. The defendant said he never employed the plaintiff. Mr. Hunter was a friend of his, and he never authorised the plaintiff to do anything. The work which he had done was not wanted by him. He thought that the plaintiff was in Hunter's service. The case was adjourned for the attendance of Hunter. At the adjourned hearing, Mr. C. Val Hunter, C C., said there was no reason for the defendant saying he would only charge him very little. He understood it was an ordinary business matter. He did not embark on speculative work. Mr. Commissioner Kerr said he must non-suit the plaintiff, but he would not give the defendant any costs. The plaintiff might have the case tried by a jury if he liked.

A Pembroke Arbitration.—Brown v. Harris.—In this case, which recently figured in the Court of Appeal, the plaintiff, Louis William Brown, a builder, residing and carrying on business at Pembroke, sued the defendant, William Cowper Harris, also residing at Pembroke, for the sum of £134 7s. 6d., balance alleged to be due for certain work done by plaintiff for the defendant in the erection of a dwelling-house at Pembroke. An order of Court was made referring the action to be tried by a special referee, and the parties agreed to the appointment of Mr. W. Morgan Griffiths, solicitor, Carmarthen. The arbitrator's award now published allows defendant the sum of £71 4s. 3d., and he directs that plaintiff shall pay the costs.

Carpenters Committed for Intimidation.—At Wolverhampton Police Station, on Wednesday, Leonard Nott and Aaron Griffiths, carpenters on strike, were charged with intimidating James Devellen. Prosecutor was a non-society carpenter from Kidderminster, who had come to Wolverhampton and accepted work under Mr. Gough, builder, whose men are on strike. According to his evidence, the defendants told him that if he did not clear out of the town they would make it hot for him, and so frightened him that he took refuge in a barber's shop. The defendants, who elected to be tried by a jury, were committed for trial at the quarter-sessions, bail being allowed.

Building Prosecutions.—In the Pollockshaws Police-court, on the 5th inst., Baillie M'Naught was engaged for two hours hearing two building prosecutions. In the first case, George Allan, of Messrs. G. and G. Allan, builders, Glasgow, the owners of property in Harriet-street, were accused of having, on the 21st of May, permitted houses to be occupied without first having received a certificate that they were in a habitable state, and permitted them to be continuously occupied. It was stated by the burgh surveyor that a certificate had been granted a fortnight later. The Bailie imposed a fine of 20s., with a penalty of 5s. per day from the 21st May until the 13th June. In the other case, the secretary to the Cathcart District Railway Company was charged with permitting houses belonging to the railway company, and situated at Viaduct between Barrhead-road and Rossendale-road, to be occupied without having received the necessary certificate. Mr. Robertson admitted the facts, but said he would plead not guilty in respect that the houses were part of the railway works. They were inhabited by two station masters, and assessed by the assessor of railways. They could not, therefore, be dealt with under Section 180 of the Burgh Police Act. Mr. Mearns, prosecutor, argued that they could, and quoted Section 517 of the Act. Bailie M'Naught imposed a fine of 21s.

◆

WATER SUPPLY AND SANITARY MATTERS.

Blackpool.—The local authorities of Blackpool, Lytham, St. Anne's, Kirkham, Garstang, and Fleetwood are considering a scheme for the proposed purchase of the gigantic undertaking owned by the Lytham Waterworks Company, which has the sole monopoly of supplying the above-named districts with water. At a recent meeting of representatives from the authorities a resolution was passed that it was desirable that the undertaking should be possessed by a joint water board, composed of representatives of all the sanitary authorities in the area of supply. The subscribed capital of the company is about £345,600, and the market value of the undertaking is at least £600,000. How much above that sum will have to be paid by the authorities will be settled by the Parliamentary Committee before whom the Bill will come, providing no amicable settlement is arrived at. Last year's profits were £20,000, so that the concern, at £600,000, would prove remunerative, considering the great increase in the population of the district of late, more particularly Blackpool.

Glasgow.—The Glasgow Police Board received, on Monday, reports in reference to a proposal for a new drainage scheme for the western, northern, and north-western districts of the city. These reports, the Lord Provost remarked, were very satisfactory as regarded the suitability of the Corporation grounds at Dalmuir for the erection of sewage disposal works, and also as regarded the feasibility of the scheme as a whole. He asked that the committee on sewage be empowered to make borings and to prepare plans and estimates with a view to laying a complete scheme before the board, and, subject to their approval, going to Parliament for the necessary powers to proceed with it. The recommendation was adopted.

Malvern.—The extensive sanitary improvements which have recently been carried out at Malvern College under the direction of Mr. J. E. Willcox, C.E., of Birmingham, are now completed, embracing a thorough reorganisation of the whole of the drainage system and sanitary arrangements at not only all the College buildings, but at each of the masters' houses in the College grounds, all of which have been put into a perfect sanitary condition. The whole of the fittings are of the most modern type, and the work done throughout of a high order. The undertaking, which involved a very considerable outlay, necessitated the employment for several weeks of some 200 men, including 40 plumbers, and was successfully completed without having to close the College. The whole of the plumbing was carried out by Mr. E. France, of Birmingham, and the greater portion of the drainage by Messrs. Wood and Leach, of Handsworth, whilst the structural alterations, new sanitary blocks, and part of the drainage, were executed by Mr. T. Broad and Mr. W. Porter, both of Great Malvern. The sanitary specialities, urinals, latrines, and lavatory ranges, &c., were by Messrs. Adams and Co., of London, York, Birmingham, and other places, the school lavatories being of white glazed ware, and the urinals consisting of white glazed angular backs, with glazed ware capping and base combined in one piece, and special corrugated drip tiles. The flushing grease traps and drain interceptors were supplied by Messrs. Dent and Hellyer, of London, and the pedestal closets used were Twyford's Deluge M. Messrs. W. J. Williams and T. R. Day acted as clerks of the works.

Melbourne.—About 40 members of the Royal Victorian Institute of Architects, accompanied by their president, Mr. A. E. Johnson, F.R.I.B.A., paid a visit one month since to No. 1 section of the North Yarra main sewer at Yarraville (part of the sewerage works for Melbourne), for which Messrs. McCulloch and Co. are the contractors. The contract was let in January, 1893, for the sum of £59,000, a start being made in February of that year. The section commences at the pumping station and extends a distance of 4,000ft., of which 2,300ft. is excavated and 700ft. of sewer completed. It is opened up by seven shafts varying from 44ft. to 70ft. in depth. The Austrian system of tunnelling is generally employed. The ground is shored up by timber bents propped clear of concrete, which is put in in long lengths, after which the brickwork is inserted in 14ft. lengths; the timber is then removed and the work tommed up from centres during construction. The excavation of tunnel is 12ft. 6in. and the diameter of the sewer 8ft. 6in. Some 200 men are kept employed day and night, the entire works being lighted by electricity.

Perth.—The Special Drains Committee, to which consideration of the question of ventilation of sewers was remitted by the police commissioners of Perth some time ago, met last week and resumed consideration of the proposed improved ventilation of the sewers of the burgh, along with abstract of replies as to other towns in England and Scotland. All the members of the committee present, including the borough surveyor and sanitary inspector, expressed their views. After considerable discussion, it was agreed to find and to report ad interim to the commission that, in the view of the committee, a system of ventilation by open manhole is not desirable, but that the ventilation of the sewers in the burgh should be improved by a general system of upcast ventilating shafts, and to recommend the commission to approve of and sanction such a system, the borough surveyor to be asked to submit a scheme showing the positions he would propose for such shafts. Councillor A. Reid dissented, holding that a system of open manhole covers should be adopted for the wider streets and shafts for the narrower streets. At the monthly meeting of the police commission on Monday, the committee's report was brought up for adoption. Councillor A. Reid moved that they should take the opinion of an expert, such as Dr. Russell, of Glasgow. Councillor Smart moved that the matter be remitted to the commission in committee. Dr. Simpson, the medical officer of health, gave his views on the matter. The only method he knew which fulfilled all the necessary conditions of efficient ventilation was the open ventilation by grids and manholes in the centre of the streets. He quite approved of supplementing the ventilation by shafts. After discussion, Councillor Smart's motion was agreed to.

CHIPS.

It is estimated that in the forests in the western district of Minnesota, which were exposed to the recent fires, there were 150,000,000 pine-trees. The timber which remains will have to be cut this year.

The French authorities intend to restore the famous Romanesque church of Notre Dame at St. Dié in the Vosges.

The site of the new offices of the Commission of Sewers in Basinghall-street, adjoining the Guildhall, is now being cleared. The new buildings will be erected at a cost of £36,000, and it is intended that all the departments of the Commission shall be accommodated under one roof.

The town council of Carlisle considered, on Tuesday, a peremptory letter from the Local Government Board refusing a loan for new sewers until a sewage scheme had been adopted which would put an end to the pollution of the Eden. It was pointed out that the money for which application was made was absolutely necessary, and that, indeed, some of it had been already spent. A special committee was appointed to consider the whole question of sewage disposal in a dispassionate manner, and, in the mean time, it was understood that the sewers in course of construction would be completed.

New art schools are being erected at Stamford from the designs of Mr. J. C. Trayler, architect, of that town. Special consideration has been given to the ventilation, the system being that supplied by Messrs. Robert Boyle and Son, Limited, ventilating engineers, London and Glasgow. Messrs. Boyle and Son are also supplying their system of ventilation to South Mimms Church, Barnet, under the direction of the above-named architect.

The Phœnix Supply Stores, Wolverhampton, have just been completed. The Queen-street front is dealt with in a gabled Renaissance design in deep red bricks and white stone, with green slate roof. Messrs. Willcock and Co., builders, of Wolverhampton, have carried out the structural work from the designs and under the superintendence of Mr. Eachus, architect, Lichfield-street, Wolverhampton.

The foundation-stone of a new school-chapel was laid at Selly Park, Birmingham, on Wednesday, by the Right Rev. Monsignor Canon Souter. A plot of 4,000 yards at the corner of the Elmdon and Bournbrook-roads has been bought. On this a school-church and presbytery are to be built at once, the remainder of the site being reserved for a proposed church. The school was designed to accommodate 147 pupils, in accordance with the requirements of the Education Department. The principal room will be 60ft. by 22ft., and adjoining it will be a sanctuary. The chapel will be dedicated to St. Edward the Confessor. The architect is Mr. Lunn, of Malvern, and the builders are Messrs. Love and Flint, of Dudley.

Our Office Table.

The autumn exhibition of pictures at the Nottingham Castle Art Museum promises this year to be exceptionally interesting, the main feature of the display being the works of the Newlyn School, brought together by the curator of the gallery, Mr. G. H. Wallis. Some notable pictures have been sent from the art galleries of other municipalities, while Sir George M'Culloch and other private owners have contributed to the collection. Mr. Stanhope Forbes, A.R.A., will be represented by his well-known picture "The Forging of the Anchor," and by "The Village Philharmonic," and Mr. Frank Bramley, A.R.A., by "Hopeless Dawn," a picture which was purchased by the Chantrey Bequest in 1888, and "Memories." There will be several examples of the work of Mr. Chevalier Tayler, including "The Departure of the Fishing Fleet," "The Summer Dinner Party," and "For Confirmation." Mr. Adrian Stokes will be represented by "Off St. Ives" and "Cornish Cliff." There will also be examples of the work of Mr. C. Napier Hemy, Mr. T. C. Gotch, Mr. Fred Hall, Mr. H. S. Tuke, and Mrs. Adrian Stokes, as well as some water-colour drawings of Mr. Walter Langley. The exhibition, which opens at the end of the month, will be without doubt the most complete collection of works of the Cornish school that has yet been brought together.

"A Country Squire" points out the disabilities under which landowners lie in the matter of using native timber. They are not allowed to sell more than £10 of timber off an estate in one year without making a return to Somerset House, and paying succession duty. This involves the employment of a solicitor and costs out of all proportion to the value of the property sold. No allowance is made by the authorities for replanting. Owners are allowed to use their own wood on the estate for estate purposes without duty, but they have no use for ash, beech, elm, walnut, and many other trees. The trees they can use are larch, sundry firs, oak, chestnut, and poles. But it is really, he asserts, as cheap to buy squared timber from a timber-yard as to cut down one's own, for "top-sawyers" are almost extinct now. If a stable is to be roofed by local timber, the trees must be felled and drawn to the sawpit, and search has then to be made for a man who can be trusted to saw out the stuff, altogether employing two men for a month; whereas, if a note is sent to a timber-yard specifying the quantities, in two days' time all the stuff is delivered of the correct lengths. Wire netting has taken the place of sheep hurdles, and the race of hurdle-makers is as extinct as the race of sawyers.

Councillor Sloan, who took a prominent part in the introduction into Edinburgh of the refuse destructor system, has induced the Streets and Buildings Committee of that city to make an experiment in street paving which may yet have important results—getting rid of clinker refuse. Of this material 15 tons a day are turned out at Powderhall, and the question of its disposal, in respect of the enormous accumulation, has been exercising the minds of the authorities. Recently the idea occurred to Councillor Sloan that the clinker, which can be ground on the premises, might be utilised in forming the upper layers of pavement on the lines of the granolithic industry. That portion of the north side of London-road extending from one end of Hillside-gardens to the other was selected for the experiment, and there the work is now in progress in the hands of Messrs. John Baird and Son, East London-street. Previously the pavement there was "hornised," and the stones have been used as the foundation for the mixture of clinker and cement. Naturally, the clinker is of a darkish colour, but it is rendered somewhat lighter in tone through the use of chemicals, while by the aid of hematite the layers are alternately what may be described as blue and red. The layers are from 2in. to 2½in. in depth. A portion of the work has been already completed, and has been inspected by the Streets and Building Committee. Should this process of street-paving prove in the end to be substantial, the chances are that, as already indicated, a considerable saving will be effected, because, while granite chips cost from 14s. to 15s. a ton, clinker can be supplied at about 1s. per ton. Meanwhile, what is considered of most importance is the disposal of clinker. The substance is strong and firm, and the blending of colour in the alternate layers is at present regarded by the committee as attractive.

A correspondent calls attention to a clause in the conditions for the competition for the new board schools at Hartlepool, which is decidedly unfair:

> "The Board do not bind themselves to accept any plan as sent in, but reserve to themselves the right to require such modifications to be made, without charge, as they may think fit; and it is a distinct condition of this competition that they shall not be debarred from introducing any improvement merely by the fact that it appears as a feature in some plan which has not been accepted, or be required to make any compensation to the architect in whose plan the feature appears. No allowance for unaccepted plans."

In face of this intimation that the Hartlepool School Board means to suck the brains of competitors generally for its own benefit and at free cost, one can hardly imagine the response to the invitation to compete will be a very general one. At any rate, architects who *do* compete know what they have to expect. The "competent assessor" can surely not have been made acquainted with the conditions under which his award is to be made?

While at West Hartlepool the local board have by a narrow majority decided to erect a technical school, in the adjacent borough of Hartlepool the town council has deferred consideration of a similar project. Only in the face of strong opposition has a motion asking powers to borrow for a technical school been carried at Darlington, and the fate of the recent town hall scheme, with its abortive competition, suggests that in the latter town the proposal will probably be abandoned in the long run.

The Battersea Polytechnic has just issued its prospectus for the second session, which opens for day classes on Monday next, the 17th inst., and for evening classes on the 24th inst. The prospectus offers classes for both men and women in technical science, art, and commercial and general subjects, the number of classes being 133 in 71 different subjects. Special features in the prospectus are the formation of "courses of classes," with a view to encouraging continuous and co-ordinated study; the offering of special afternoon classes for apprentices, and special classes in manual training and in science, for teachers only. The prospectus also announces numerous scholarships open to its students, including offers of scholarships from Messrs. Holloway Brothers and Messrs. Archibald Smith and Stevens, of Battersea, for classes connected with their industries. The institute also issues prospectuses of its technical day school for boys, and its domestic economy schools for girls. In all respects the work of the first session is regarded by the governing body as an unqualified success and full of promise for the future. The governors, however, still need substantial additions to the building fund before the original scheme of the promoters can be completed and the full endowment secured—the sum of £2,300 being required in order to complete the sum of £60,000 and secure an additional endowment of £1,000 per year.

The Middlesbrough town council adopted on Tuesday, after a long discussion, and by a large majority, the following resolution:—"That in all future contracts entered into by the corporation of Middlesbrough, it shall be a condition that the persons tendering must declare that they pay the recognised standard rate of wages in their respective trades."

The ceremony of laying the foundation stone of the free library and technical school which Colonel D. Gamble, C.B., has presented to the borough of St. Helen's has been definitely fixed for Tuesday, October 2nd. The buildings are being erected at the corner of Hardshaw and Corporation-streets, near the town hall, and the total cost will be over £20,000. They are being erected from designs by Messrs. Briggs and Wolstenholme, of Blackburn, and were fully described and illustrated in our issue of the 31st ult.

At Monday's meeting of the standing joint committee of the Glamorgan County Council, held at the county offices, Cardiff, it was agreed to adopt the recommendation that a house be purchased or built, with two cells attached, at a cost of about £300, for the purposes of a new police-station at Treorky. It was mentioned that houses and lock-up cells would shortly have to be provided at Clydach Vale, Gilvach, Tonyrefail, Mardy, Tylorstown, Aberdare Junction, Cylfynydd, Llanbradach, Aber (Senghenydd), Nelson, and Ystrad Rhondda.

Trade News.

WAGES MOVEMENTS.

Basingstoke.—A strike has occurred among the carpenters of this town in consequence of the refusal of the employers to concede an advanced ½d. per hour—from 5½d. to 6d.

Navvies and Bricklayers' Union.—The fourth annual conference of the Navvies', Bricklayers', Labourers', and General Labourers' Union opened on Friday at the Club Union Hall, Clerkenwell-road, when over one hundred delegates from London and the provinces were present. Mr. John Ward, the president of the Union, was voted to the chair. An uproarious discussion took place on the report, and a vote of censure was passed on the Executive for overruling a decision of the last conference to discontinue the payment of 1s. to those deputed to visit the branches. A motion censuring the Executive for their conduct during the Norwich strike was lost after an acrimonious debate by an overwhelming majority. At the resumed meeting on Monday, Mr. Ward, the president, again occupied the chair, and there was a full attendance of delegates. Several delegates complained of the manner in which the balance-sheet had been drawn up. An item of £19 1s. 0½d., paid to the president for attending meetings throughout the country, was pronounced extremely excessive. Mr. Robinson, one of the auditors, said he could not agree with his fellow auditor that the balance-sheet was satisfactory. Various resolutions seeking to regulate the calling out of men on strike were proposed and successively rejected, and the rules remained unaltered.

◆

Mr. Albert Ludovici, of King Henry's-road, London, a well-known member of the Royal Society of British Artists, died at Vevey, Switzerland, on Monday, in his 75th year.

The annual exhibition of the Sheffield Society of Artists was opened on Monday. For the first time valuable pictures by artists of national repute were exhibited, including G. F. Watts, G. H. Boughton, Alfred East, and others. There was a conversazione in the evening, when Professor Herkomer delivered a lecture on portrait painting.

CHIPS.

The great parish church of St. Germans, Cornwall, was reopened by the Archbishop of Canterbury on Wednesday, after a restoration carried out at a cost of over £6,000.

The Great Western Railway Company officially declare that there is absolutely no foundation for the statement that they are giving up Milford Haven in favour of Brean.

Mr. W. J. B. Clerke, M.I.C.E., held an inquiry, on behalf of the Local Government Board, in the Ercall Assembly Room, on Friday, respecting the application of the Wellington, Salop, Commissioners for sanction to borrow £4,000 for sewerage works and sewage disposal, and £1,800 for waterworks. Mr. T. S. Stooke, the engineer to the rural sanitary authority, explained the proposals.

The new hospital which is being erected by the Birkenhead Corporation, from the plans and under the superintendence of the borough engineer, Mr. C. Brownridge, is now nearing completion. It is being warmed and ventilated by means of Shorlands' patent Manchester stoves, with descending smoke flues, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Mr. Yarrow, the torpedo-boat builder, has given £120,000 for the erection of a children's convalescent hospital at Broadstairs.

St. Paul's Church, Hulme, was reopened on Sunday. The interior of the church has been greatly altered and improved. The side roofs have been raised several feet, the entrance has been enlarged, oak choir-stalls, pulpit, and Communion table have been provided, a new plan of lighting and ventilating has been adopted, and the whole church has been decorated. The cost of the work has been about £1,200.

FRIDAY, SEPTEMBER 21, 1894.

FRAUDS IN DESIGN.

THERE are few of the arts in which stratagem or deception is not practised. Music, for example, has a wide range of expression, in differences of pitch, its rise and fall, in changes of key, by which the musician can awaken certain emotions, and even reproduce illusively the effects of natural phenomena. The dramatic and emotional effects are as wide and numerous as the human emotions. Tenderness, sweetness, soothing effects, anguish, wailing, and even the roar of the sea and thunder, can be reproduced. A change of key affects us like a change of colour or of movement, and the tones and inflexions of the human voice can be imitated. The Greek forms of music were capable of expressing human emotions in a way which shows an intimate connection between words and melody, according to Mr. Monro, in his work on the "Modes of Ancient Greek Music." This unrivalled power has been called into requisition in the production of operatic and dramatic compositions. In like manner the painter is able to disguise or intensify facts of nature by various artifices and tricks, and in the architect's hands various kinds of deception have been practised for the purpose of impressing the beholder. All these devices are perfectly legitimate, and are used in the service of the highest art. As the variations of accent with those of pitch and time differentiate musical forms, and the movement assume an impressive gravity, a march-like firmness, or playful lightness, each of which has its value, also the architect can reproduce impressiveness, awe, stately rhythm, homeliness, playful and gay effects without being chargeable with having violated the canons of his art.

It is when deception is practised with a view to an unlawful or unfair advantage that it becomes offensive, as when we see an over-strained piece of acting, or a building intended for a commonplace object embellished by Classical orders or Gothic gables and turrets. There were many frauds practised by our forefathers, as when they tacked on to the domestic offices or stables Classical frontispieces to carry on the main elevation of the house, or when they tried to make a groined plaster vault look like a stone one by jointing. These are intentional mispresentations which cannot be condoned. They pass beyond the merely imitational and reproductive architecture of the day, which aimed at building heathen temples and monastic buildings. It was when we saw a stucco residence jointed so as to represent stone ashlar, or a blank window or parapet erected to hide a low hip roof behind, that we revolted against the system. If the stucco had been honestly treated as stucco, and the screen or parapet had been a screen or parapet, and nothing more, we could have tolerated the method. We admit there has been a good deal of stupid sentimentality preached about "shams" in architecture, about the unlawfulness of plaster ceilings and walls; that everything should show the material in its naked plainness, that all disguises are necessarily deceitful, and should be abhorred as a vice, and so on. All these ravings have been discounted at their proper value. But there are worse frauds than these committed every day by the adoption of false styles, by misrepresenting façades, by methods of construction, and the use of materials which are counterfeits.

Frauds of this kind begin in the architect's office. The intention to deceive is present when Mr. Tryster attempts to win a competition by a stratagem. He "cooks" his perspective to show both fronts of his building, to exhibit a tower or a dome where it cannot be really seen, or to make his façades higher or more important than the elevations allow. A constructive expedient or roof which will be an eyesore he artfully conceals or allows to drop out of sight. The sub-contractor or tradesman finds in the scheming architect a useful ally in introducing a substitute for a real material. Drawings etched and coloured often indulge in fictitious representations and exaggerations that sorely deceive the unwary client. The screen, whether in the shape of a façade, a ceiling, the casing of a girder or column, has been a prolific source of fraud in architecture. The old architects used screens as façades on the west fronts of many of our cathedrals. Those of Lincoln, Wells, Peterborough, Salisbury may be mentioned; but they all have a purpose which place them above any desire to deceive. Not one of them can be said to have been adopted with the object of pretending to be a more important front than the edifice behind warranted, and though, in the case of Lincoln and Salisbury, the west front disguises the outline of the roofs, it does so simply as a screen intended for the display of niches and statues. At Peterborough the question was whether the new front should be built down to the already existing roof lines, or should the old Norman structure disappear behind a front more in accordance with Early English design. The argument of difference of style had to be considered in these cases. The Lincoln and Wells fronts were boldly-conceived designs to finish the earlier work, and to give the opportunity for the series of sculptures which adorn them. The sloping lines of the aisle roofs could not be more appropriately finished than by a level front, as at Lincoln or at Salisbury. A raking parapet parallel to the roof would have been meagre, and could not have been treated with so much dignity. The western towers, such as we find at Canterbury, York, Ripon, Southwell, Lichfield, and other cathedrals, provided even a bolder way of stopping the aisles. Instead, if the architect had gabled the end to the lean-to aisle, it would have been really deceptive. We have sometimes seen a pointed gable erected to hide a low-pitched roof behind; of course, as dishonest a mode of finish as possible. It is far better to make the west front level at the top, like Notre Dame, Paris, and many of the Rhenish churches. The screen walls which Wren erected to conceal the aisles of St. Paul's have been taken to task by critics. They are certainly disguises of a very bold kind; they conceal the actual clerestory of the nave and the aisle roofs, and give an appearance of size and width to the building that it does not possess, but they have certain useful structural and decorative functions. We might also find fault with the external dome as disguising the real inner cupola and increasing the apparent height, as also that of the Invalides, Paris, and many other structures; but these are disguises which have their value as external roofs, and may be classed in the same category as the timber roofs over the vaults of our churches. To a certain degree, they may be called "frauds," but they are not intentional; they do not aim at deceiving, but simply emphasise certain parts, and give them external importance.

Greater dishonesty, to our minds, is evinced by an architect who designs a front in a style that has not the slightest fitness for the building, which really is intended to give it a character that it does not possess. For example, a front to a warehouse or a shop more suited to a building dedicated to Euterpe or Terpsichore, large ornamental windows to a bank or a mercantile house, a florid façade to a warehouse, what are these but masks and frauds? How many bare and naked interiors are to be found behind elaborate façades, expanses of plate glass, or leaded stained-glass windows? These are glaring instances of the deceit we are discussing. What is a greater fraud than a blank window or a spacious portico leading to a cramped entrance? Intended to misrepresent, they are really dishonest. There are other modes of counterfeiting not so bad, intended to conceal defects, to disguise the exigencies of construction or to improve external symmetry. And it is of these we must say a few words. Very few architects escape altogether from this kind of misrepresentation. It often saves trouble in design to conceal. There is a temptation to encase an iron column or stanchion with terracotta or decorated tiles, which may be carried to dangerous lengths. There can be no objection to encase an iron column with terracotta designed with an appropriate intention as a column or a support; but if it were made of disproportionate size, either to the meagre proportions of an iron column, or on the contrary to appear as a massive column or pier, the design would in either case be objectionable. It is a real fraud to line a thin partition with faïence, and to insert here and there large pilasters to make people think the wall is thick and massive.

Ceilings and roofs are often disguised in a reprehensible way. We have seen an iron truss encased in wood to represent timber principals, an utterly wrong thing to do. Plaster ceilings with massive beams of plaster running across, or as ribs like a vault, underneath an iron roof, are certainly dishonest, though we see them repeatedly. A plaster ceiling should exhibit clearly that it is an inner covering, and not represent itself to be a stone vault or beamed ceiling. A very common mode of construction is to "cradle" down a straight beam or girder, and make it assume an arch of plaster or wood. If not a fraud it is very like one, and is certainly not honest architecture. The cupola is a feature upon which ingenuity has been exercised. Counterfeit materials have been used to disguise the outer and inner shape, as in those of St. Paul's; but the most objectionable kind of misrepresentation is to make the inner cupola assume the appearance of a massive ribbed dome, or of a totally different form. In the interior there is little to be seen but a flat saucer-like cupola; outside, a lofty and massive dome appears. One is apt to say, "What a fraud!" The casing is a convenient mode of hiding real and often exceedingly ugly things. Who has not often wished to conceal the spiral stair of the iron-founder. There is a gaunt corkscrew-like skeleton of iron right in the centre of the commercial-room of a bank or a shop, or placed against a wall, ornamental it may be with perforated spandrels and risers. The only honest and sensible way of treating it is to fill up the space between the winding stair with open iron or woodwork. Any attempt to conceal the stair as we have occasionally seen is dishonest, especially if the designer endeavours to make it look like something else. A casing is legitimate so long as it does not wholly conceal or misrepresent. Then we see many shams on the outside of buildings, such as false parapets to represent greater height, or to conceal a roof; cornices are often seen in their wrong position, either to make the façade look higher than it is, or below the ceiling level of the upper story. Chimneys are often grouped with dummies to produce balance, and roofs are put in as counterfeits. These modes of counterfeiting or feigning often entail a roundabout way of doing simple things. Many other shams and dishonesties might be pointed to in smaller details if space allowed.

There are many ways of deceiving practised in joinery and plasterers' work to which attention might be drawn. Imitational art and painting are particularly open to the charge. The custom of graining and marbling is utterly repugnant to any sense of honest art. No one can mistake the best specimen of the art for a piece of real oak or maple or marble, and yet the art continues to be practised, in spite of all the remonstrances levelled against it. A deception like this can hardly be condoned upon any rational ground. We can admire a good imitation of a flower on paper or canvas or wood; but we can scarcely tolerate with serenity the covering-up of one wood by a painted imitation of another, however good the imitation may be, for the work has merely the intention of deceiving. It is not a painted imitation for ornament sake, but a deliberate attempt to disguise one material by the semblance of another. Real frauds are those in which there is an intention to deceive—to make things appear other than they are—and in this category must be placed painting, graining, marbling, veneering, and such like simulations, fabrications of other more expensive materials for the purpose of deception and imposition.

◆

MODERN STREET PLANNING.

ACCIDENT often accomplishes more than design. We seek variety and other sources of artistic effect by rules which nature imparts through the agencies of weather and age. The most strenuous efforts we make to produce the effects of colour or texture are comparatively futile when contrasted with those which time and age impart to our buildings. The beauty of the rain-stained ruin, or the lichen-covered walls, or the weather-toned roof, cannot be imitated by any artificial process. And it is much the same with the plans of the architect and those of the urban authority. The London County Council, in their eagerness to promote street improvements have neglected those opportunities for, and means of, effect that slow growth and age would have insured. Nor have they availed themselves of any substitution for the natural process of street formation. Let us make our meaning clear. A new route is to be opened from A to B, cutting through various old blocks of houses, and intersecting several cross streets. A survey of the neighbourhood is made, and the surveyor sketches the line of the new route, as straight as circumstances permit, with little regard to anything except that of avoiding the demolition of or cutting through property for which heavy compensation would be demanded. This arbitrary choice of a route is naturally to a large extent quite fortuitous; it does not take into account any of the centres of traffic that are crossed; many of them are cut obliquely, and thus acute and obtuse angles are formed, which are awkward for building purposes. Again, the new road is planned of parallel and equal width throughout. Let us contrast this with the old and piecemeal growth of streets such as we see in any of our thoroughfares in London and other cities. No straight or arbitrary line was fixed upon; the houses were added one by one from one centre to another, or along a line that seemed to have been spontaneously chosen for its natural convenience or geographical value. And another characteristic distinguished its mode of development: the street was formed of varying width—some houses were set back, others advanced, till the street assumed a variety of angles and contours which give them so picturesque an effect. The thoroughfares of the Strand, Fleet-street, Oxford-street, and Holborn, and the High-streets of Oxford and many of our ancient provincial towns, exemplify the slow formation of the street according to the old law.

In the laying-out of our modern streets and towns we have sacrificed the above principle of growth to the arbitrary choice of route determined on map, and have, in so doing, lost all that is artistic. To recover the pleasing elements we must now recur to certain principles of laying out which are practically unknown to urban authorities and county councils. In short, we must plan our new streets by the aid of æsthetic rules which were formerly supplied by the exigencies of population and accidental circumstaces. A paper read before the late International Engineering Congress of the Columbian Exhibition by Herr J. Stübben, of Cologne, affords a few hints in this connection which are worth the attention of urban authorities and our London County Council. The author deals first with the practical requirements of traffic, of building, and of health, and secondly with æsthetic principles in laying out. Into the first part we need hardly enter. Adequate supply of air and light in the streets and blocks, and also to the buildings, is, of course essential, and for this purpose the limitation of height is one of the chief necessaries. The new Streets and Buildings Act will to some extent insure these points. Herr Stübben observes that the height of buildings ought not practically to exceed the space between them, which, of course, means that the houses should not exceed the width of the street. Open squares as reservoirs of air at certain intervals are necessary, open courts and gardens in blocks and other open spaces are advocated. These spaces or areas can, it is thought, be formed by the voluntary consent of property owners, or be provided compulsorily by the official city building plan, so that free plazas be kept open in the street system. In London these requirements have been fairly met in a few of the more favoured areas. To keep large blocks free of building is still necessary, as, for instance, in portions of the neighbourhood of Drury-lane, which is now being demolished. Continuous rows of houses might also be prevented. We have too many long, continuous streets. Another feature advocated is the provision of trees for shade. In this respect London has not been behind other towns. The Victoria Embankment, Rosebery-avenue, Kennington-road, and other thoroughfares, are examples of what can be accomplished by the planting of suitable trees. Extra width of street is required for this addition to the hygienic requirement of our towns, and from 65ft. to 98ft. is advocated. One important principle in street arrangement is that a street should not be too long, or, rather, that any great length ought to be relieved by change of direction, by curves, and by variations of width or squares at intervals. A very long street wearies the eye, and causes a sensation of fatigue and discomfort to the pedestrian. Herr Stübben says this unpleasant sensation begins as soon as the length of the same street exceeds twenty or thirty times its width. When a change of direction is undesirable or unattainable, there is the remedy against this tiresome length of varying the width and cross-section. With regard to curves and bends, these ought to be made to conform to natural boundaries, and to the levels of the ground. On hilly and unlevel ground, the straight road is more tolerable than it would be on perfectly level ground, because the natural falls and rises would produce curvature to the eye. We often see new roads formed in straight lines over the summit of a hill. This gives an awkward and unpleasant appearance which can be avoided by bending the street in plan to follow the contour of the surface. The contour levels round hilly and undulating surfaces ought to determine the direction and curvature of every street or road. On the brow of a hill the street should partake of a contour level round it, following, in fact, lines parallel to it, by which the difficulties of level are avoided and unsightly buildings across the summit are obviated. The breaking-up or interruption of a long, straight street by open squares or gardens at the junction of cross roads; the setting back of frontages at intervals, squares, and crescents, are modes of varying our streets which are within the means at the disposal of our municipal authorities. By following these principles, we may do a little to relieve the monotony of our streets, and impart to our modern towns somewhat of that picturesqueness and beauty which were the result of slow growth and age in our ancient cities.

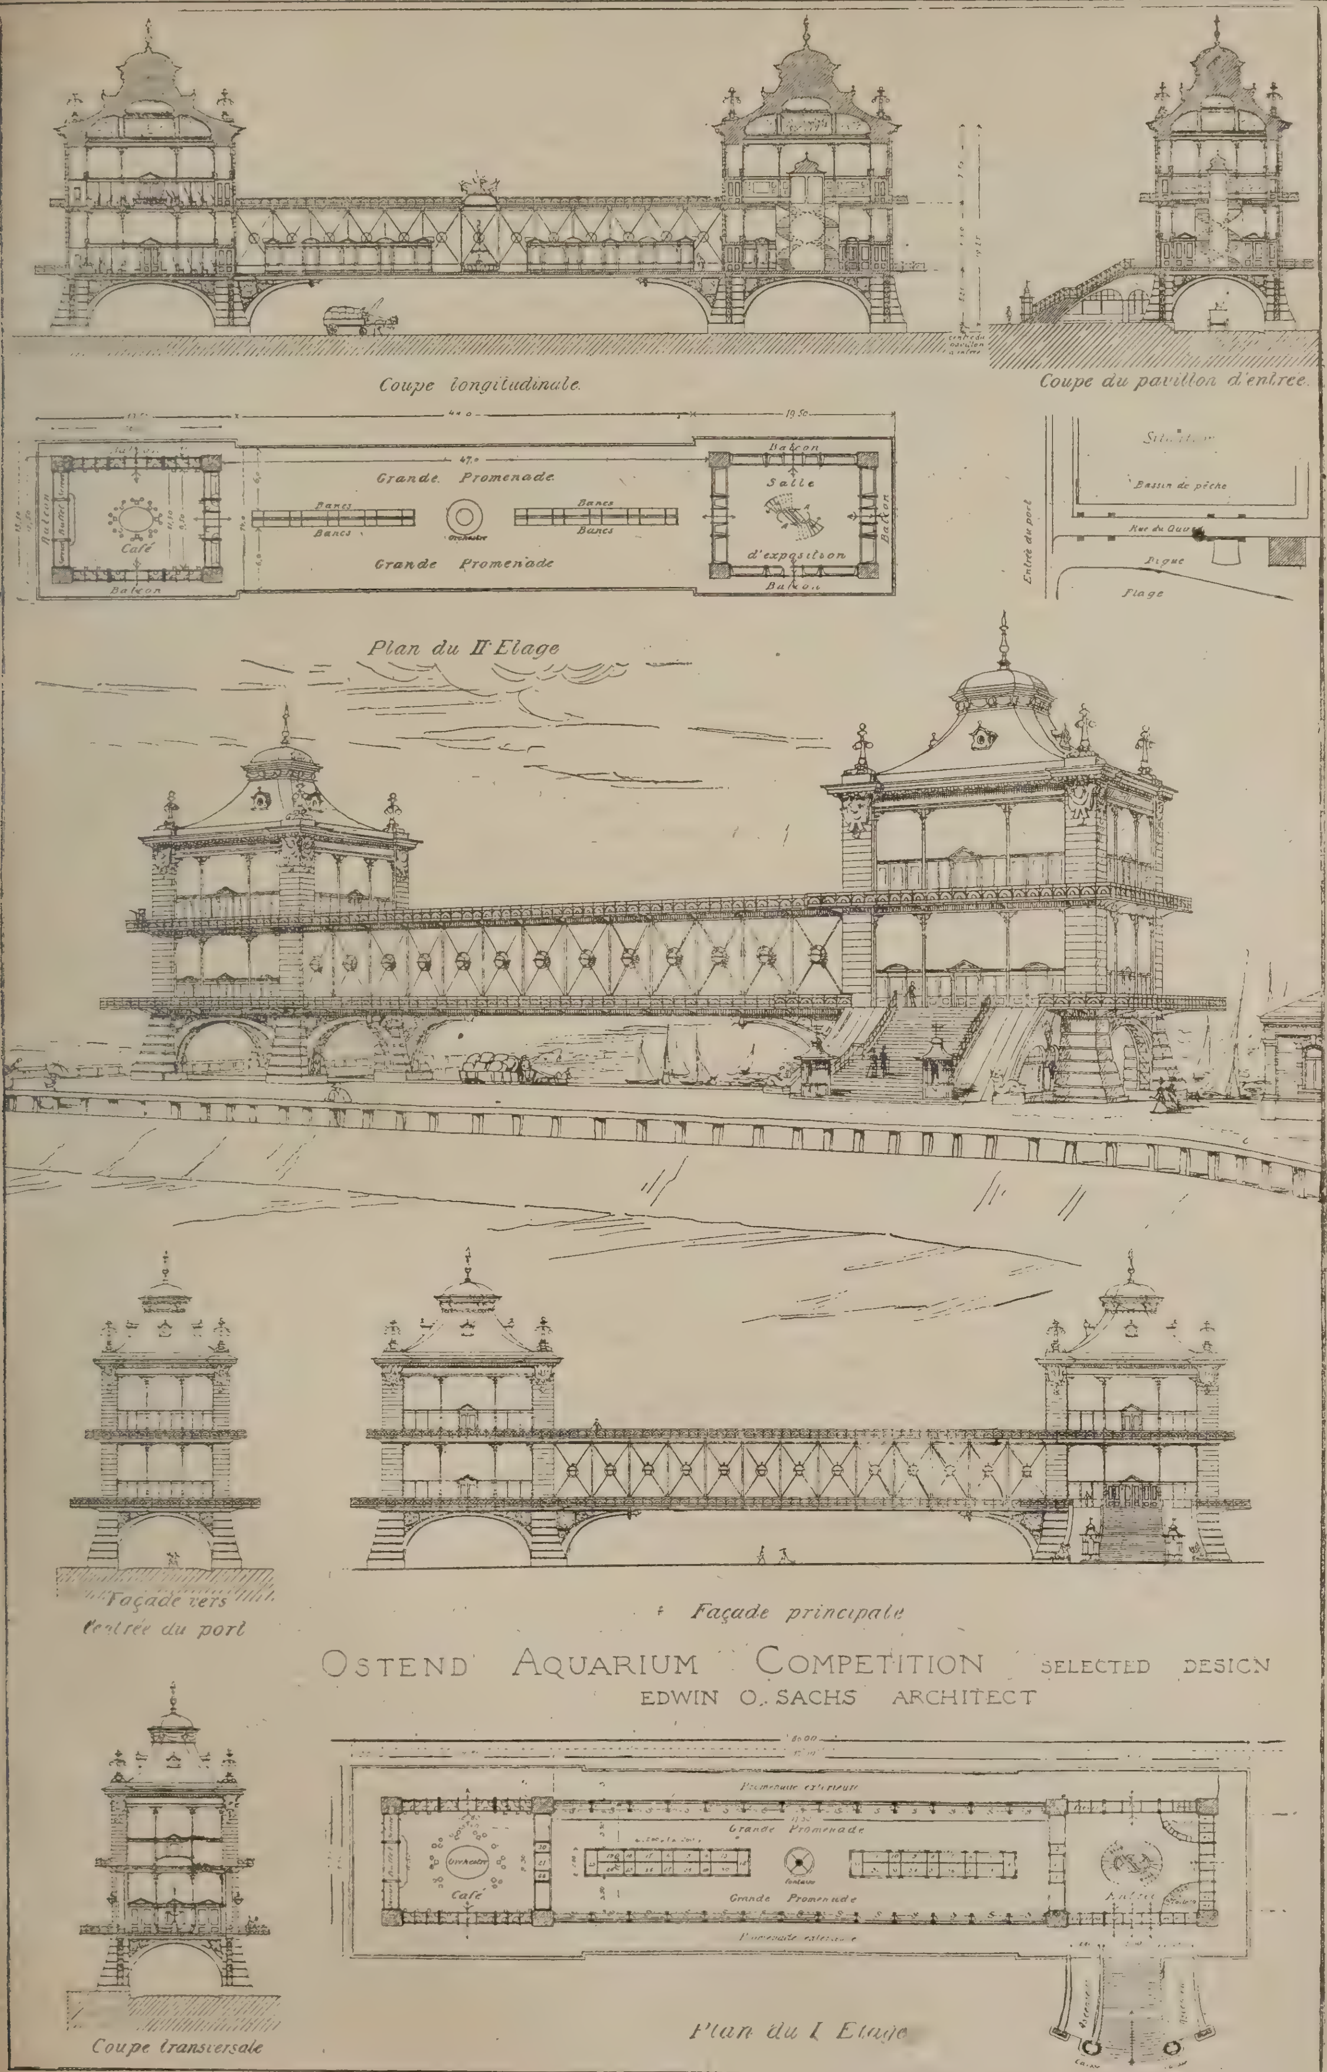
◆

THE PROPOSED OSTEND AQUARIUM.

WE have come across many curious building sites, but the one selected for the proposed Ostend Aquarium is certainly one of the most exceptional. Situated close to the pier at the northern extremity of the Digue, or favourite promenade on the sea-front, it is practically simply an embankment some 200ft. long, which is at present used for unloading fishing craft. The traffic of this quay is not to be disturbed, nor is the picturesque view from the promenade across the fishing harbour to be interrupted. The central part of the block must also not exceed a certain height, as the line of firing for some guns standing inland is not to be broken. The design which we illustrate is by Mr. Edwin O. Sachs, of 11, Waterloo-place, who has prepared it for what we would, in this country, term a limited competition. His drawings found the most favour of the sets sent in, and we understand that, as far as can be seen at present, there are no obstacles to their being carried out. M. Jules de Hemptinne, of Ghent—a gentleman of great influence in his country—is the originator of the idea of giving Ostend this new "attraction," and it practically rested with him and some non-professional friends to frame the list of requirements, and to decide on the merits of the different proposals put before them. The opinions of several architects and engineers were, however, taken, and their advice influenced the decisions. Mr. Sachs, as will be seen, has overcome the difficulties of the site by practically adopting the principles of a tubular bridge. The whole building rests on two groups of piers, and these stand on either side of the carriage-way of the quay. Visitors on the Digne can practically have the same view as before, and the business operations on the embankment will scarcely be affected. The main floor of the building is reached by a broad flight of steps, on each side of which cunicular lifts have been arranged for. Two ticket-offices govern the approaches. Under the stairs room has been found for the necessary machinery and some offices. The vestibule, which can be approached through double doors from three sides, according to the direction of the wind, leads into the main gallery. Ample space is allowed for some forty tanks and a promenade, without interfering with the access of light or the view. At the further end of the gallery there is a large refreshment room, with a small band-stand. There is a broad balcony surrounding the whole of the part covered in. Ample lavatory accommodation has been provided, and room found for some flower and cigar-stalls. The second floor, if we may so call it, can again be reached by some stairs or two lifts. The hall into which the staircase opens fulfils the requirements of an exhibition room for local sea-scape painters and other artists. The broad roof over the gallery is to be used as an open promenade, with a band-stand; and a large refreshment room, similar to the one below, has also been provided for on this level. The aquarium will have to answer a number of purposes. It is to be open to school children for certain hours in the morning, if they are under charge of teachers, and it is to be at the disposal of *savants*, who will also have a research station close by with minor tanks, laboratories, studies, &c. In the afternoon the block will answer the purposes of a pier-pavilion for the Ostend visitors, and in the evening it will be at the disposal of the local burgesses who do not patronise the Grand Casino. On fête days the aquarium is to be the headquarters of the excursionist.

◆

A Masonic hall in Ferry-road, Exmouth, was opened last week. It is built of red brick with Bath stone and limestone dressings, and the lodge-room is 40ft. by 27ft. and 16ft. high to open-timbered roof. The building has been designed by Messrs. Kerley and Ellis, architects, of Exmouth, the contractor being Mr. A. Hayman, of the same town. The cost of the entire work is about £2,000.



OSTEND AQUARIUM COMPETITION SELECTED DESIGN

EDWIN O. SACHS ARCHITECT

THE PLANNING OF FEVER HOSPITALS.

At the International Congress of Hygiene and Demography at Buda Pesth, on Wednesday in last week, Mr. T. W. Aldwinckle, F.R.I.B.A., read a paper on "The Planning of Fever Hospitals." During the outbreak of scarlet fever in London in 1892-3, the Metropolitan Asylums Board found their hospital accommodation so far below the needs of London that they resolved, the lecturer reminded his hearers, to erect their new permanent fever hospitals, each to contain 800 beds. The first was now in course of erection at Shooter's Hill. A committee had visited the best hospitals in Europe, and had drawn up a report which, in the opinion of the experts, formed the best textbook in existence on the subject of the requirements of a fever hospital. The "Brook Hospital," the first of the three to be eventually provided, was the embodiment of the leading ideas of that report. The main principles on which the hospital was designed were:—(1) A separate entrance for infectious and non-infectious patients; (2) separation of staff quarters from the infected buildings; (3) complete separation of diseases; (4) isolation of alien diseases; (5) provision of abundant light and air to all buildings. A nurses' home for 194 nurses was in three separate blocks, and there were separate homes for female servants and men servants. The wards for scarlet fever were placed in eight main pavilions, all of the same type, each pavilion consisting of two floors, the upper floor being entirely cut off from connection with the lower floor. Each main ward contained 20 beds with lineal wall space of 12ft. for each, a floor area of 156ft., and a cubic space of 2,028ft. Similar arrangements were made in separate wards for diphtheria and enteric fever, but the main wards, 90ft. long, would contain only 12 beds. The electric light was used throughout the buildings. A separate ambulance was provided. The cost for the whole would be about £250,000. In the course of the discussion which followed the reading of the paper, Professor Banister Fletcher, J.P., one of the honorary presidents of the congress, said one remarkable point in the able description given by Mr. Aldwinckle of the planning of this hospital was the fact that the cost per bed was higher than in the case of any previous hospital ever built. The maximum cost had hitherto been £250 per bed, and that was the cost in Buda-Pesth, but in the Brooke Hospital it would be £500. There had been a good deal of adverse criticism as to the cost, especially by the Scottish members present in the section. Professor Banister Fletcher thought they ought not to lose sight of the fact that in this case the experiment was being tried of having the very best hospital planning that could be created, and in such an experiment cost should not be too much considered. It was clear that the initial outlay on a building bore little relation to that of its maintenance, and it would often happen that where a building was properly planned the cost of management and maintenance was reduced in consequence. The first necessity was to obtain such a plan that disease could be best combated, in order that the term of the patient's occupany of a bed might be reduced, which in itself would be a saving to the ratepayer.

Among those who subsequently criticised the plans most severely from the point of view of cost was Mr. W. Acworth, the chairman of the Small-pox Hospital Committee of the Metropolitan Asylums Board. Several of the foreign members, as well as the Scottish members of the congress, also criticised the plans.

AUCTIONEERS' CONFERENCE AT NEWCASTLE.

The members of the Auctioneers' Institute met at Newcastle-on-Tyne last Friday for the first time. There was a meeting of the various committees of the institute, held at the County Hotel, in the morning, Mr. Everill, of Worcester, presiding, when amongst those present were Mr. George Brinsley, London; Mr. G. G. Stanham, London; Mr. G. Dobson, Bradford; Mr. Wm. Weatherhead, Keighley; Mr. Chas. Harris, London (secretary of the institute), and others. A full meeting of the council was held in the afternoon, when, as was the case in the morning, the proceedings were private.

In the evening a meeting and conference were held in the County Hotel, under the chairmanship of Mr. Frank Everill, of Worcester, President of the Association.

The chairman said, on behalf of the council, he had to express their pleasure at seeing so many of them there that night. He asked them not exactly to regard that meeting in the conventional sense, but to look upon it more in a social light, and, while he asked them to do this, he said he could not but feel that, at a gathering like that, they were likely to derive much more good by a friendly exchange of opinions than if they stuck to the method of dry formalities. He alluded to the objects of the Institute as being to promote, encourage, and foster personal friendly intercourse, to adopt a proper scale of charges, to protect the general interests of the profession and the public, to discuss the affairs of the profession, to read papers, and so on. So far as the Institute had been enabled to deal with these objects, he might say that it was started in 1886; they struggled hard for about three years; then their difficulties were overcome, and in 1889 the institute was incorporated. Since that time the membership had enlarged very considerably; and there was every sign that it would still further enlarge. But it was not a question only of enlargement in point of members, because the council recognised that one of its first objects was to raise the status of the profession. They did not say to others, "Come to us" merely; but they wanted not only a certificate of character, but a certificate of qualification also. If they did not insist upon this, their objects would be defeated. The object of the Institute was law and order; it was the best form of government, and therefore it was very desirable that they should be all banded together under one controlling power. With regard to how far they had been able to discharge some of the duties for which they were formed, they had, in the first place, instituted a system of examinations. So far, of course, they had not had a large number who had submitted themselves to that ordeal; but those who had done so had passed through it very creditably, and he had no doubt that, in the course of time, they would year by year get an increasing number of persons in connection with the examination. Papers had been drawn up for the examination by men of ability and men of standing. To secure the certificate the candidates must have a good education, and, in the second place, it was requisite that he should possess a considerable amount of ability. The next point that he wished to refer to was the subject of valuations for probate. He was sure they all knew as well as he did how much injury had been done to them of late by the fact that valuations were said to be not required. The necessity of valuations being required had been, indeed, rather pooh-poohed by members of the legal profession; in the highest quarters they had not been insisted upon, and it seemed likely that they would become fewer and fewer year by year. This was a point that affected them very much. Such valuations were of course a considerable source of income to them, and it struck him that the Government should not allow such a lax state of things to exist. It must be patent to them all that, if a valuation was made by an interested party, the Government would get the worst of it. The council had had the importance of this subject impressed upon them for some time past, and they had taken every step they could to bring before the Government the desirability of valuations being made by qualified men. He thought they were right in insisting upon this, not only upon public grounds, but upon professional grounds. They were professional valuers, and should not have these valuations snatched away from them by others who had no license to pay. As the matter stood at present, petitions had been before the Lord Chancellor, the President of the High Court of Justice, and the Chancellor of the Exchequer; and they were endeavouring in every possible way to bring pressure to bear upon Members of Parliament in the different districts, that they might insist upon what that institution was trying to obtain. The Finance Act had been passed this year, and in it was stipulated that the County Council or County Borough Council should appoint valuers to whom any question arising on the value of the estate of a deceased person should be referred. Well, one of the latest things that council had done was to communicate with the County Councils and County Borough Councils throughout the country, asking them to give consideration to any application that might be made by members of that institute for appointment; and he had heard that already one of their members who was there that night had received such an appointment. They would see, therefore, that the influence of an institute like that was bound to be of service to all members of the profession. The Institute had published a capital year-book for the use of members of the profession, and they were establishing a library of suitable books for students who desired to prepare for their examination. After referring to the great activity of the secretary of the institute (Mr. Chas. Harris, of London), the chairman alluded to several remedies required in connection with the profession, and especially mentioned the fact that there were individuals who advertised themselves as auctioneers—individuals who had no license, who never intended to get one, but who got other persons to sell for them when they got a sale. He need scarcely say that this was altogether illegal, and he was happy to say that he was informed by the secretary that between 50 and 60 of these persons in London alone had, through the interference of the institute, been compelled either to take out licenses or paint out the word "auctioneer" from their signboard. This had been done entirely through the action of the institute, and it postulated the truth that they could not work individually so well as they could work collectively. He recommended the benevolent fund to their notice, and urged the necessity of all endeavouring to make the profession as honourable as any profession they had in the kingdom.

Mr. Turnbull, Chester-le-Street, expressed the pleasure he felt at the council having at last come to the North of England. He trusted that some who were there that night would, before they went away, come to the conclusion to join the institute. He was informed by the secretary that there were 12,000 auctioneers in the kingdom, and he thought it would really be strange if at least they could not obtain one-half of that number as institute members. As a means towards that end, he suggested that a local branch of the parent institute be commenced for the four northern counties.

Mr. R. C. Pearce, Darlington, agreed with the remarks of the chairman and of Mr. Turnbull. He held that it was desirable that the status of the profession should be raised, and he was quite in accord with the suggestion for the formation of a branch.

Messrs. Hunter, Garland, Ryan, Wheater, Burlinson, Stanham, Brinsley, and Dobson also spoke on various matters affecting the profession.

There was a feeling somewhat widely expressed in favour of a local branch. Mr. Sanderson undertook to act as sec. pro tem., and the chairman announced that steps would probably be taken to carry the idea into effect.

On the motion of Mr. Slee, Gateshead, seconded by Mr. R. S. Benson, Darlington, a hearty vote of thanks was passed to the chairman for his services.

SANITARY INSTITUTE CONGRESS IN LIVERPOOL.

The 14th congress of the members of the Sanitary Institute will be held in Liverpool next week, opening on Monday and closing on the Saturday. The programme includes conferences of sanitary inspectors, municipal and county engineers, medical officers of health, and of ladies who take an interest in sanitary matters. In addition, there will be an exhibition in the Drill-hall, Upper Warwick-street. The various meetings are to be held at the University College, Brownlow-hill, but an address, to be given to working people by Sir J. Crichton Browne, will be delivered in the Picton Lecture-hall. Sir Francis Sharp Powell, M.P., is president of the congress, and will deliver the inaugural address. The local general committee is a strong one, but, necessarily, the bulk of the work has devolved upon the honorary local secretaries, Mr. H. Percy Boulnois, city engineer, and Dr. E. W. Hope, medical officer of health.

The conference of municipal and county engineers, to be opened on Tuesday, will be under the presidency of Mr. A. M. Fowler, of Salford, and papers will be read by Mr. John A. Brodie, Mr. James Deas, and Mr. H. Royle. Afterwards the members will visit the destructor works in Chisenhale-street, the Hydraulic Power Company's station in Athol-street, the Toxteth-park destructor works, and the Liverpool Electric Supply Company's station in Lark-lane.

The Section of Engineering and Architecture will be opened on Thursday by an address from the president, Mr. G. F. Deacon, M.Inst.C.E., and papers on engineering and architectural subjects will be read on that and the following day.

A series of lectures and demonstrations for sanitary officers, arranged under the auspices of the Sanitary Institute and the Technical Education Committee of the Corporation of Liverpool, will be given. There are twelve lectures, taking a wide range of subjects, and among the lecturers are Dr. Louis Parkes, M.O H. (Chelsea), Mr. H. P. Boulnois, Dr. Francis Vacher, Dr. H. E. Armstrong, of Newcastle, and Prof. A. Wynter Blyth, M.O.H. (Marylebone). In connection with the lectures arrangements will be made for the students to visit various works illustrative of sanitary practice and administration. A conference on the sanitation of the passenger and mercantile marine service will be opened by an address by Sir W. B. Forwood. Arrangements have also been made for visits to vessels in the river and the docks, and to Messrs. Laird's yard. Dr. Charles E. Paget will take the chair at the conference of medical officers of health, and will give an address. Papers will be read on subjects of moment by Drs. A. Hill, J. Priestley, H. Littlejohn, G. Reid, E. W. Hope, and W. N. Thursfield. The conference of ladies will be inaugurated by the Lady Mayoress. It goes without saying that arrangements have been made for pleasure excursions, and a number of places of interest to the members will be visited.

◆

GRANITE PAVING IN SHEFFIELD.

THE City Council of Sheffield have received a report from the Highway and Sewerage Committee as to granite paving, arising out of a memorial which had been presented, alleging that serious accidents had occurred from the use of granite sets in the city, and further, that certain roads which were mentioned were unfit to drive over, and that Manchester, Glasgow, Edinburgh, and Newcastle were discontinuing the use of granite. The committee point out that similar accidents to horses have occurred in streets paved with other materials, and they append to their report letters from Mr. T. de Courcy Meade, C.E., City Surveyor of Manchester; Mr. D. C. Proudfoot, City Road Surveyor, Edinburgh; Mr. Jno. Whyte, C.E., Master of Works, Glasgow; Mr. W. G. Laws, C.E., City Engineer, Newcastle-upon-Tyne, and from the City Engineer's office, Norwich, where granite is being substituted for wood. The committee add that it is impossible to avoid the conclusion that granite is by far the most economical form of paving, and forms a much more permanent roadway than any other material. They are of opinion that the danger arising from the use of granite sets properly laid on streets of suitable gradient has been very much exaggerated. Granite is not now laid nor proposed to be laid on steeper gradients than 1 in 25, and this could be reduced to about 1 in 30. They recognise the necessity for efficient sanding and watering, and leave it to the city council to determine whether the disadvantages of noise and possible slipperiness are sufficient to outweigh and overbalance the advantages of economy and permanent better state of repair of granite-paved roads over wood, gritstone, or other materials. In comparing with macadam, the serious extra cost of cleansing cannot be left out of account.

Appended is a report by Mr. C. F. Wike, city surveyor, which gives a large amount of information as to the use of granite in Sheffield and other large towns. He states that of the 291 miles of streets and roads within the city, 204 are laid with macadam, 47½ with boulders, nearly 20 with gritstone, and about 20¼ miles with granite, of which five miles, or one fourth of the total length, has been laid during the last five years, the first extensive use of granite in Sheffield dating from the construction of tramways about twenty years ago. The accompanying information based on particulars supplied by the surveyors of 29 of the largest towns in England, Ireland, and Scotland, all of which use granite, shows that 19 towns have granite-paved streets, the steepest gradients of which vary from 1 in 10 to 1 in 20.

Name of Town.	Up to what Gradient Granite Used.	Whether Gritstone Used.	Which Material Preferred.	Life of Granite Pavement in Years.
Aberdeen	1 in 12	No	—	Not less than 20.
Belfast	1 in 37	No	Granite	12 to 15 years without repairs; supposed life, 40 or 50 years.
Birkenhead	1 in 15 and 20	No	Welsh syenite	25 or 30, and perhaps 20 more, with redressing.
Birmingham	1 in 13	No	Granite	Varies. L.G.B. allowed 25 years.
Bolton	1 in 17	Yes, for all but main roads.	Granite where traffic heavy.	Average 30 years, with good bed.
Bradford	1 in 16	Yes	Heavy traffic, granite; light traffic, gritstone.	18 to 25 years.
Burnley	1 in 30 to 1 in 14	In streets without heavy traffic.	Granite	20 years.
Bury	1 in 30	Yes	Granite for main roads.	Cannot say. Paving down 8 years, and not a penny spent; say 30 years, then redressed, and 20 years more, &c.
Carlisle	Whinstone up to 1 in 25. Granite when steeper.	No	Granite for inclines; whinstone for flat grades.	About 30.
Chester	1 in 30	Have experimented. Does not wear well, only four or five years.	—	Some for ever; other kinds for 10 or 12 years.
Clapham, Surrey	1 in 30	No	—	About 20 years.
Dewsbury	On level.	Yes	Granite	50 years.
Dublin	1 in 36	No	—	30 years. Still in fair condition.
Edinburgh	1 in 16	No	—	About 25.
Gateshead	—	No	—	—
Glasgow	1 in 18	No	—	40 years in some cases, and another 30 after redressing.
Huddersfield	1 in 17	Yes	Granite	1st, 16 years; 2nd, after redressing where necessary, ditto.
Hull	1 in 20	Only for crossings under light traffic.	Granite	About 75 with redressing and relaying.
Liverpool	1 in 18	No	—	Depends upon traffic.
Manchester	About 1 in 25	Yes	—	Ditto, 15 to 30 years.
Newcastle-on-Tyne	1 in 12	No	Granite	Ditto, over 30 years.
Nottingham	1 in 10	No	—	Ditto, some laid 25 years ago, now in good condition.
Paddington	1 in 20 5	No	—	12 to 16 years.
Plymouth	1 in 12	No	—	20 years.
Rochdale	1 in 13	In secondary streets	Granite	20 and 25 to 40 years and more.
Salford	1 in 19	Yes	Granite for heavy traffic.	About 25 years; depends on traffic.
Sunderland	1 in 10	Very little	Granite certainly for heavy traffic.	40 years, and then can be taken up and laid elsewhere.
West Bromwich	1 in 16	No	Depends upon traffic and situation.	—
York	1 in 30 (about)	No	Granite	—

Mr. Wike adds that in some of the older granite-paved streets in Sheffield the crossfalls are very quick. This is especially the case along the tram routes, where the longitudinal gradients have been considered to the detriment of the cross sections of the roads. In these cases the crossfall is more dangerous than the granite itself. Quick crossfalls are dangerous with any paving, and every opportunity is taken, when a street is relaid, to flatten the cross section. Some of the old crossfalls were as steep as 1 in 19·25 and 1 in 12·67. The granite recently laid has very flat cross-sections, rarely extending 1 in 30 or 1 in 36. The difference in the cost of granite and gritstone in three leading streets for a period of 25 years—it being estimated that five years may be allowed for the life of gritstone, and 25 years for granite—works out that in a quarter of a century gritstone costs, on an average, per yard from 61s. 6d. to 68s. 4d., against 18s. 4d. for granite, while repairs cost from 2s. 5d. to 2s. 9d. per yard each for gritstone, against about 8½d. for granite. Mr. Wike adds:—When it is considered that a granite street only requires on an average laying once in 25 years, while a gritstone street, with similar traffic, requires relaying five times during the same period, it will be seen that this is a matter of great importance, as frequent disturbance of the street means serious interference with business, loss of trade to shopkeepers, and inconvenience to the public.

◆

LIVERPOOL WATER SUPPLY FROM VYRNWY.

THE Lord Mayor of Liverpool formally inaugurated at the Kensington reservoir on Tuesday the new main between Prescot and Kensington, by means of which water will be conveyed directly to Liverpool from Vyrnwy Lake without first entering the Prescot reservoirs. The new main will increase the supply of water to the city by about sixteen millions of gallons daily. It has been laid by corporation workmen, under the direction of Mr. Joseph Parry, water engineer, at a total cost of about £62,000. The aqueduct consists of cast-iron pipes 3ft. 4in. internal diameter from Prescot to Knotty Ash, and, with the exception of two short lengths of steel tube, of cast-iron pipes of 3ft. diameter from Knotty Ash to the Kensington reservoir, Liverpool. The Cheshire Lines Railway at Knotty Ash and the London and North-Western Railway at Stanley are crossed by means of riveted steel tubes of the same diameter as the cast-iron pipes. The aqueduct commences with a junction with the Vyrnwy pipes at a distance of 242 yards from the inlet of the Prescot reservoir. There is also a junction with the Rivington aqueduct in the same road, and these junctions are so arranged that water can be turned into the new main either from the Vyrnwy or Rivington works direct, or from the Prescot reservoir. The pipes are laid along the Eccleston and St. Helen's roads to the Prescot lodge of Knowsley Park. They then cross the park, emerging into the public road a little over a mile from Prescot. The pipes continue along the Liverpool and Huyton main road, with the exception of one short deviation, to the corner of Eaton-road, Knotty Ash. Here the 40in. pipes terminate, and a branch pipe of 2ft. internal diameter is taken off to convey water to the intended new reservoir at Breeze-hill, Walton. This main to Breeze-hill has also been completed, with the exception of crossing the Cheshire Lines Railway at West Derby station. The 40in. main is now reduced to 36in., and this diameter is continued along the Prescot-road through Old Swan to the Kensington reservoir The length of the new main between Prescot and Kensington is nearly 7½ miles, and the length of the 24in. branch from Knotty Ash to Breeze-hill is 4½ miles. The whole of the cast-iron pipes employed have been supplied by the Staveley Coal and Iron Company, Limited, Staveley, near Chesterfield, to the specification of the water engineer; and the joints for the most part consist of the kind known as bored and turned, in which one pipe is socketed into the other with asphalte and twine, and without the use of lead or caulking. The minimum thickness of the pipes is 1in., and the maximum thickness used under special conditions is 1½in. The pipes have been cast in 12ft. lengths, and vary in weight from 43cwt. to 57cwt. All the pipes were manufactured under the supervision of an inspector appointed by the Liverpool Water Committee, and were tested under pressure. Every pipe has been coated internally and externally by dipping in a hot asphaltic mixture, to retard corrosion as long as possible. The steel tubes crossing the Cheshire Lines Railway at Knotty Ash were made by Messrs. Fawcett. Preston, and Co., of Liverpool, and the steel tube crossing the Stanley Bridge of the London and North-Western Railway by Messrs. D. Rollo and Sons, Liverpool. The actual expenditure in wages of workmen and salaries of superintendents has been £17,090. To complete the extensions and improvements recommended there still remain to be carried out the following works, which have been sanctioned by the city council: service reservoir on Breeze-hill, estimated cost £35,000; distributing mains from Breeze hill reservoir, £5,000; and new high-pressure engine at Aubrey-street, pumps and boilers, £10,000.

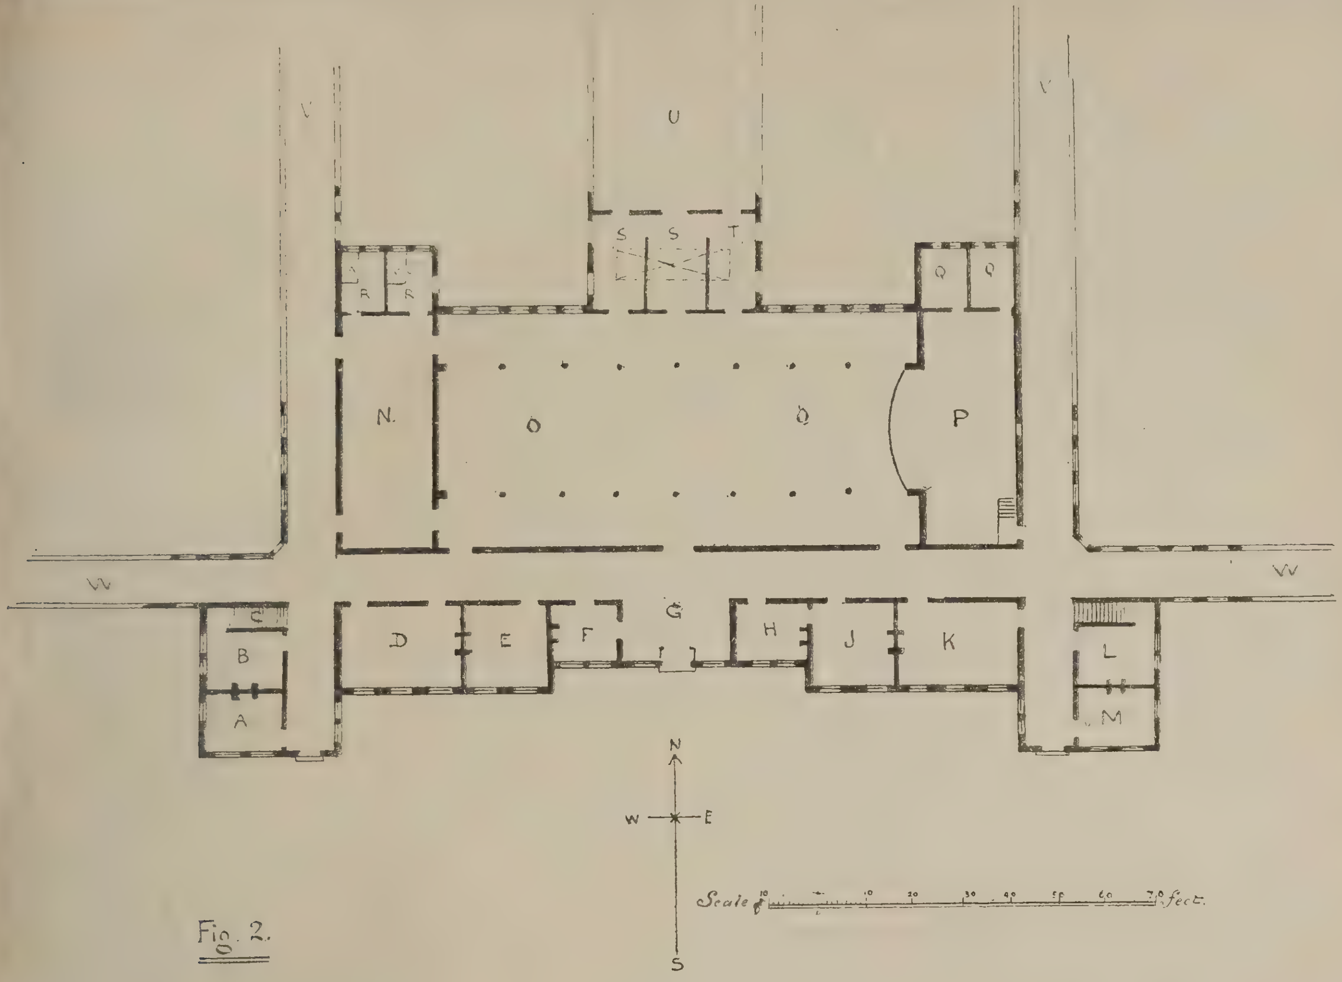

Fig. 2.

COUNTY LUNATIC ASYLUMS.—II.

By George H. Bibby, F.R.I.B.A.

ADMINISTRATION BUILDINGS.

THE asylum architect must carefully bear in mind, while designing the apartments to be occupied by the staff, that the social status of the officers, their mode of living, and salaries vary to a considerable extent, and that he may have to provide accommodation for the professional medical superintendent with a salary of £1,500 per annum, and also for the porter or labourer who may not be paid more than a few shillings per week, in addition, perhaps to his rooms rent free. Provision must be made *pro ratâ* for the accommodation of all classes of officials.

The resident medical officer is the chief officer in all asylums. We will therefore consider, in the first place, what are the best arrangements that can be made in designing and locating his residence in relation to the asylum buildings generally. His residence should undoubtedly be as nearly central as possible, that he may be equidistant from all parts of the institution; the nearer that he can be situated to the infirmary wards the better, for it is in these that his duties are most extensively exercised, and as the medical officer is compelled at all times and in all weathers to visit the asylum, his house should be connected with the main building by a covered and inclosed corridor which might be heated, together with other portions of the buildings, from the general heating system of the asylum.

The medical superintendent's house should contain a large dining-room, a drawing-room, a morning or smoking-room, also a room set aside for official work in the form of a combined study and office (unless such a room be provided for near to the board room or other offices). In addition to the usual kitchens and offices, there should be about seven or eight bedrooms, a good hall and staircase, bathroom, &c.; but the extent of this residence naturally depends upon the actual stipend of the occupant, who, in addition to having his house rent free, has also frequently coals, gas or electric light, milk, vegetables, &c., gratuitously supplied from the asylum stores.

In arranging the plan of the doctor's house, and in choosing the locality for the site, care should be observed that no private-room windows or garden ground overlook the airing-courts to be used by the patients in the institution. The scenes there are not desirable for the continued inspection of a private family.

It might be convenient to place a cloakroom and lavatory, &c., in connection with the corridor, passage, or covered way leading from the asylum building to the medical superintendent's residence; the doctor would then be enabled to change his clothing, or perform his ablutions, after leaving patients or fever wards, &c., before entering his home.

The addition of a good conservatory (from which flowers and plants for the use, not only of the medical officer's family, but perhaps also for the sick and other wards of the asylum) is an item of importance. Cheerfulness and brightness contribute so much towards relieving patients of their various ailments that flowers should when possible be plentifully supplied.

[Referring to Fig. 1, on opposite page, A is the main entrance; B, board room and offices; C, assistant medical officer's quarters; D, male attendants; E, boilers and engines, &c.; F, laundry; G, laundry delivery; H H, laundry reception; J J, bath-houses; K, nurses' mess room; L, attendants' mess room; M, general store room; N N N, kitchen offices; O, kitchen; P, scullery; Q, serving rooms, &c.; R, dining and recreation hall; S, church; S_1 S_2, church "fit" rooms; T, dispensary; U, library; V V, visiting rooms; W, female attendants; X X, matron and assistant matron; Y, corridor; Z, medical superintendent's house; W R, work rooms; W Y, work yards; W C, closets and lavatories; S R, sewing room; D Y, drying yard; A C, airing courts; F E, future extensions; M C, main corridor; A E, asylum entrances.]

The assistant medical officer's (*vide* Fig. 1c) apartments should usually be placed near to the centre of the asylum, but in such a position that due privacy may be secured (*vide* M, Fig. 2). The rooms should be well separated from the lodgings appropriated to the use of the nurses, matron, and other female officials (*vide* W, Fig. 1); special water-closets, lavatories, and bathrooms must be provided for their use. If funds permit (and certainly in large asylums) the architect should contrive to arrange for a smoking-room, or smoking-room and billiard-room combined, for the use of the medical and other superior officers, &c. (Billiard and clubrooms for subordinate officers and patients being, of course, a separate arrangement.)

Occasionally a detached residence is provided for the first assistant medical officer, whose salary being frequently about £250 (in addition to which there are allowances), is not adequate for the support of more than a moderate house, which must be arranged by the architect upon a suitable scale accordingly. The salaries of the junior assistant vary from £100 to £250 with or without board, lodging, washing, &c., and the private sitting-rooms, mess-rooms, &c., differ much in various asylums.

Detached or semi-detached houses or apartments will usually be provided for the steward, chaplain, clerk to the asylum, engineer, matron (vide A, Fig. 2), laundry matron, head gardener, and a certain number of married attendants. These must all, of course, be proportioned in size and style to the emoluments of the officials who would occupy them. As a rule, however, the chaplain, clerk, and steward would require fairly good residences and probably garden attached.

A very large number of officials are employed in asylums; amongst others are the assistant matron, work mistresses and masters, inspectors, day and night nurses and attendants, porters, messmen, gate porters, cooks, bakers, tailors, shoemakers, and many others who should be lodged within or near to the administrative buildings, care being always observed to separate these as to the sexes and also to some extent as to grade.

Large asylum buildings require continual attention in decorative and structural matters, and there is a necessity to maintain a staff of carpenters, bricklayers, painters, plumbers, &c., to keep the asylum in repair; these are seldom lodged in the asylum (unless as labour masters), are paid by the day or week, and provide their own lodgings away from the institution.

Other particulars of the construction and arrangement of apartments (in the patients' wards) specially intended for the use of asylum officials will be given in connection with each ward or block of building, together with some details as to the routine of duties carried out therein.

That the architect may be able to plan an asylum well, it is absolutely necessary that he should have considerable information as to the duties and dangers to be apprehended by asylum officials, and respecting the numerous classes of the insane. Some of the latter require much more warmth than others, and in the most simple matters require the closest attention from the nurses; while others are well able, and willing, not only to work and assist the nurses, but also to produce profitable returns to the asylum. Many patients are very cleanly, and capable of attending to themselves in most things; but these are the minority. There are dirty cases (requiring bathing several times daily), dangerous and dirty cases, noisy cases and quiet ones, and patients of all these descriptions with a variety of complications of bodily and mental defects, aged and young of both sexes, and of all dispositions. The problem for the architect is the provision of accommodation where the various classes may be suitably lodged and cared for, with so much or little contact with one another, as circumstances may require.

◆

CHIPS.

The four-light window of Flamstead Church, Herts, has been filled with stained glass as a memorial. The subjects are the Nativity, the Blessing of the Children, Christ as the Good Shepherd, and the Resurrection. Messrs. A. O. Hemming and Co , of Margaret-street, W., were the artists.

The Christchurch board of guardians are about to erect a series of cottage homes. The contractor is Mr. J. Chinchen, whose tender has been accepted at £10,500, and Mr. Isaac Graham, of Wolverhampton, is the clerk of works.

The Chorlton board of guardians decided on Friday to purchase an estate at Wilmslow, extending to 192½ acres, at a cost of £20,000, for the erection on a portion of the land of workhouse schools.

A drinking fountain of polished red granite, the gift to the town of Elland by Mr. John Dewhirst, of Woodlands, was erected in the recreation grounds last week. It is quatrefoil on plan, having four basins, with a continuous flow of water issuing from bronze lions' heads, and the whole surmounted by a large Imperial crown, also in bronze. The architect is Mr. W. Swinden Barber, of Halifax, and the work has been executed by Messrs. Earp and Hobbs, sculptors, of Lambeth and Manchester.

A new park has just been completed at Armley, a Leeds suburb. The land, acquired at a cost of £14,500, comprises 24 acres, previously forming part of a farmstead. At the main entrance are three gates, the centre one giving access to a carriage drive, and the others to footpaths. In the centre of the park are some seven or eight acres of grass. Two panels near the front entrance are the contribution of Messrs. Cliff and Sons, of New Wortley. The Leeds corporation have erected two small drinking fountains, occupying a central position.

At Christ Church, Frome, on Thursday in last week, a memorial altar, designed and executed by Messrs. Harry Hems and Sons, of Exeter, was dedicated. It is of oak, 6ft. 6in. long, and 3ft. 2in. in height. The central panel represents our Lord in majesty, with an adoring angel on each of the side panels. The top consists of a solid slab of variegated English alabaster, and the retable has tracery with emblems of the Passion.

The St. Helen's parish church, St. Helen's, Lancs, after being closed for eight weeks for extensive repairs, was reopened on Sunday. The scheme of renovation included the reroofing of the edifice, the decoration of the chancel walls, and the provision of an improved system of ventilation, at a total cost of about £1,100. The plans for the work were prepared by Mr. Wallace Gandy, of St. Helen's, and the contract was given to Mr. John Whittaker, builder, Sutton, who died somewhat suddenly a few weeks ago.

Mr. Thomas Codrington, C.E., one of the Local Government Board inspectors, held an inquiry at the town hall, Newport, Mon., on Thursday in last week, as to an application by the Newport local authority to borrow £10,000—£8,000 for street improvements and £2,000 for the erection of a fire-brigade station. The town clerk said the £8,000 was for the making of Cambrian-road, the new relief street to High-street, and also for the making of Harrby-street, a right-angled thoroughfare from Cambrian-road.

Castlecroft Congregational Church, Bury, Lancs, was reopened on Sunday on the completion of works of renovation, including reroofing, reglazing of all windows, decoration, and improved ventilation. The structural alterations have been carried out by Mr. Charles Brierley, the glazing has been done by Mr. James Mason; the lighting and ventilating by Messrs. J. H. Pickup and Co., and the decorating by Messrs. Hall and Allen, all of Bury.

ARCHÆOLOGICAL.

Man and the Mammoth at Przedmost.—Herr Karl Maschka, the director of the exploration in the Moravian district near Prerau, the most important site of prehistoric human and animal remains existing in Europe, reports that during the past thirteen years most extraordinary deposits of animal remains have been found at Przedmost. The number of mammoth remains can now be counted by thousands, among which are to be seen many complete teeth, parts of the skull, and vertebræ. In all the remains represent at least 300 animals. He has specimens of the ice fox, reindeer, snow hare, horse, cave lion, brown bear, cave bear, elk, snow hen, and many other animals; and, more important, still many specimens of man's tools, axes, lances, and javelins which he used in hunting the wild animals. Herr Maschka traces an increasing sense of the beautiful in the carving on ivory and bone, and in the inscriptions found on the backbone of the mammoth, which was the contemporary of man on earth during this period. Till quite recently he had not come upon the actual remains of man, except in very small fragments, which left him in considerable doubt as to their origin. But in August of the present year he hit upon a grave which had without a doubt served as a burial-ground of several human beings of the diluvial period. This grave contained complete skeletons of eight persons, which were placed with their heads towards the north. One elderly man, distinguished by a very strong physique; an elderly woman; a mature person, whose teeth were in perfect condition; three young people, one of whom had not yet cut his wisdom teeth; a child just losing its milk teeth, apparently between eight and nine years old; and an infant. Some of the skeletons are in a good state of cohesion, but in no case have the skulls, which have low foreheads and deep-set eyes, escaped destruction. With these human remains was found the shoulder-blade of a mammoth.

Roman Remains in the Taunus. — Some interesting discoveries have been made this summer in the Taunus by the German archæologists who are engaged in exploring the "limes," under the guidance of General von Sarwey and Professor Hettner. At Hofheim, between Wiesbaden and Frankfort, Dr. Wolff has discovered and excavated the remains of a Roman fort about 600ft. square, which seems to belong to an early period in the Roman occupation of the district, and which in some points closely resembles the Roman fort at Wiesbaden. It stands in a commanding position, with a wide view over the Rhine Valley, just at the mouth of the pass which leads through Idstein from the Rhine to the lands beyond the Taunus Hills. It was presumably founded at least as early as the reign of Domitian, and was abandoned possibly in the middle of the second century, if the evidence of coins and tiles be accepted as conclusive. On the Pfahlgraben itself Herr Jacobi, the excavator of the Saalburg, has prosecuted his inquiries at three places, with curious results. At Zugmantel, about eight miles north of Wiesbaden, he has found proof that the existing fort is an enlargement of an earlier structure, and that its history so far agrees with that of some other Roman forts in the neighbourhood. Elsewhere he has lighted upon ditches and mounds, connected, as he supposes, with the Roman land surveying system as applied officially to the planning of the camps as well as the frontier lines.

◆

The Wesleyan chapel at Wolstanton, Staffs, is about to be rebuilt at a cost of £4,500. Accommodation will be provided for 750 persons, and the building will consist of a nave and aisles, with transepts and octagon-ended orchestra. The style will be Perpendicular, and the walls will be of local bricks, with Alton stone dressings. Mr. A. R Wood is the architect, and Mr. G. A. Foster the contractor.

At a meeting of the committee of the school of art at Newcastle-under-Lyme, the head mastership, vacant by the death of Mr. J. P. Bacon, was conferred upon Mr. C. H. Whitworth, of Birmingham. Mr. Whitworth was born in West Bromwich, and received instruction in art in the Birmingham School of Design. For 20 years he has been closely connected with art in Birmingham, and for 10 years was one of the teaching staff of the art school there. Since 1882 his paintings of marine and landscape subjects have annually been exhibited in various galleries, including the Royal Academy. At the reopening of the art school on Monday next, the classes will be held in new premises provided in the Municipal Buildings.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Dundee Institute of Architecture.—The tenth annual report of this body states that the election of two members is balanced by the resignation of two, leaving the total the same—viz., 54. By the withdrawal of 17 associates, the death of three, and the election of four, the total number of associates is reduced from 183 to 167; while from the number of honorary members one has to be deducted (leaving eight). The treasurer's balance in hand is about £17, being a little less than last year. Mr. Robert Keith, M.S.A., has been elected president, and Mr. Leslie Ower, F.R.I.B.A., vice-president for the ensuing year; the members of council being Mr. G. G. Maclaren, architect; Mr. James Foggie, architect; Mr. William Briggs, granolithic contractor; and Mr. William Nixon, solicitor. The honorary secretaries are Messrs. J. J. Henderson and George Jamieson, architects.

East Riding Antiquarian Society. — The annual meeting of this society is to be held at Driffield on Monday and Tuesday next. Proceedings will commence in the Corn Exchange, where a meeting of members will be held at one o'clock on Monday, at which the annual report and balance-sheet will be submitted, and the officers for the ensuing year will be elected. The president, the Rev. Dr. Cox, F.S.A., will occupy the chair. A paper will be read by Mr. Arthur F. Leach, F.S.A., on "Beverley Town Book." The Mortimer Museum will afterwards be visited, and short descriptions of more important features given by the Rev. E. Maule Cole and Mr. J. R. Mortimer. This museum contains by far the best local collection of prehistoric remains in Great Britain. Later in the afternoon the members will proceed to the Driffield Church, the features of which will be described by the Rev. Dr. Cox. The Moot Hill will be visited at four o'clock, and a paper read on "Folk Moots" by the Rev. E. Maule Cole. Then the party will proceed to Little Driffield Church, where a paper will be read on "King Alfred of Northumbria" (who is buried there) by the Rev. A. N. Cooper, of Filey, hon. sec. to the society. Mr. Temple Moore will also comment on the architectural features of the two Driffield churches. After the annual dinner, a conversazione will be held at Highfield House in the evening. Several short papers and addresses will be given, including "Flints in Peace and War," by the president; "The Stocks in East Yorkshire," by Mr. John Nicholson, of Hull; and "The Scandinavian Element in the Dialect of East Yorkshire, especially with Reference to Agricultural Terms." On Tuesday morning a start will be made for Kirkburton, with its unusually fine example of a Late Norman church. Next will be visited Bainton Church, which is chiefly in the Flowing Decorated style, and contains the fine monument of Edward de Mauley. Both churches will be inspected under the guidance of Mr. John Bilson, F.R.I.B.A., of Hull. At Watton Priory the excavations now being conducted will be described by Mr. W. H. St. John Hope, secretary to the Society of Antiquaries.

◆

The last excursion for the season of the archæological section of the Birmingham and Midland Institute took place on Wednesday week, when the members visited Moreton Old Hall, Cheshire, the largest half-timbered building in the kingdom; Astbury parish church, where Mr. Charles Lynam, F.S.A , of Stoke-on-Trent, acted as guide; and the town hall at Congleton.

Extensive improvements are about to be carried out at Dagnall-street Wesleyan chapel, St. Alban's, the works including reseating and the provision of an organ-chamber and seats for a choir. Messrs. J. and W. Savage, of St. Alban's, are the contractors.

The new municipal buildings for the borough of Coatbridge, erected from designs by Mr. A. M. G. Mitchell of that town, will be formally opened on Thursday, October 4th. We illustrated the buildings, which are of a plain type of Renaissance, and have cost about £25,000, by a perspective and plan in the Building News for July 31, 1891.

Considerable progress is now being made in the construction of subsidiary sewers in the Rhondda Valleys. The whole of the Hafod, Porth, Williamstown, Penygraig, and Llwynypia has been connected with the main sewer. The sections at Pentre, Treorky and Treherbert, and Ferndale are being made, and these localities will also be connected completely with the main sewer in the course of five or six months.

DR. SCHLIEMANN'S MAUSOLEUM AT ATHENS.—CARDIFF POST OFFICE.—THE OLD RATH-HAUS, SCHWALENBERG.—OFFICES OF THE SCOTTISH TEMPERANCE LEAGUE, GLASGOW.—STALLEN FARM, COMPTON, SHERBORNE.—LINCOLN CATHEDRAL, FROM THE CASTLE.—OSTEND AQUARIUM.—BUSINESS PREMISES, KINGSLAND.

Our Illustrations.

DR. SCHLIEMANN'S MAUSOLEUM IN THE CEMETERY AT ATHENS.

DR. SCHLIEMANN charged, in the year 1883, the architect-professor, Mr. E. Ziller, with the delineation of his monument, and inclosed the sketch in his last will, because he preferred it to the other sketches presented to him, and because it had the closest connection with his sphere of art. The cost was fixed by stipulation at 50,000 drachmas (about £2,000). The substructure is of grey marble of Pentelikon. The frieze, which is 16 mètres long, and the other parts of the monument, are of white marble of Pentelikon. In the metopes different things found during Dr. Schliemann's excavations are represented. The marble bust is erected between the front intercolumns. This relief is 16 mètres long and 0·60 mètre high; it closes the substructure, and represents the following scenes: Front—In the middle, King Proetos (Προῖτος), in the shape of a man of mature age, has his head adorned by a wreath of flowers. Leaning with his left hand on the sceptre, he turns with outstretched right hand to the Cyclops, who heap up, by his order, colossal quantities of stones in order to raise the walls of the tower of Tyrins. Next to him stands an old man as a representative of his counsellors, and beside this one a woman cowers on the ground with a child on her breast. On the south side.—The sacrifice of Artemis in Aulis. A decorated bull is being led to the scene of action. Behind the sacrificial flame the picture of Artemis is represented on a column. Agamemnon, who makes the sacrifice, lifts his hands imploringly to Artemis. Joined to this scene, on the right, is the fight around the vessels near the banks of Troja. Further on follows the fight for the corpse of Patroclus. The end of this scene is formed by the sacrifice on the grave of Agamemnon made by Electra; Orestes and Pylades assisted in this act. The back is subdivided into three parts. On the left, Nausikäa returning from the shore, and behind her, Odysseus. In the middle Eumæus is sitting on a rock, and the third part represents the murder of the wooers. The northern longside represents the excavations of Schliemann and the principal places of his activity. They follow from the left to the right: Mycæne, Tyrins, Orchomenos, Troja. In the centre of the relief Schliemann stands, reading Homer to his wife. The final group shows how the principal things found during his excavations are led away in a carriage. In composing the last frieze, Professor Ziller consulted the late Dr. Lolling, Conservator of the Archæological Museum, and the sculptor, Karasmy, executed the frieze in marble. The vault was decorated, according to the last will, with Pompeian paintings, and this vault of the tomb, being constructed in white marble, that material furnishes the ground tint or background for the coloured painting. Dr. Schliemann had the inscriptions made during his lifetime by Professor Russoparlos. They are as follows:—On the epistyle of the front side—

ΣΛΙΜΑΝΝΩΙΗΡΩΙ.

On the lintel of the door leading to the vault—

ΕΙΝΡΙΧΟΝΚΕΥΘΩΣΛΙΕΜΑΝΝΟΝΟΥΜΕ-
ΓΑΚΛΕΟΣΤΟΝΣΕΜΙΜΕΙΣΘΑΙΧΡΗΠΟΛΛ
ΑΠΟΝΕΥΝΤΑΒΡΟΤΟΙΣ.

The whole work was executed in one year, under the direction of the architect.

CARDIFF POST OFFICE.

THIS new building is being erected at the angle of Westgate and Park-streets, having frontages respectively of 215ft. and 138ft., and is to contain accommodation for both postal and telegraph work. In the basement will be stores; on the ground, public office 50ft. by 46ft., with offices for the postmaster and his staff, delivery rooms for the telegraph, and a sorting-office, having an area of 9,600 superficial feet. There will also be large cart-yard, engine and boiler rooms, and space for extension of the buildings. The mezzanine will be occupied by rooms for caretaker and women. On the first floor there will be accommodation for the engineer, cloakrooms for the staff, with dining-rooms, kitchen, &c.; and the second floor will be occupied by the instrument room, and the battery room will be placed in the roof. The building will be faced with Portland stone, with brown Shap granite architraves to the street entrance, grey Aberdeen columns to the principal entrance, and Bessbrook granite columns to the first-floor coupled windows. The roofs, which are constructed of steel, will be covered towards the streets with Tilberthwaite green slates. The entrance doors and fittings of the public office will be constructed of teak. The building will be of fireproof construction throughout, with oak or other wood-block flooring; hydrants will be provided in each floor, and the lighting will be by electricity. The architect is Mr. Henry Tanner, F.R.I.B.A., and the builders are Messrs. Turner and Sons, of Cardiff.

THE OLD RATH-HAUS, SCHWALENBERG, LIPPE-DETMOND, GERMANY.

THIS exceedingly picturesque and admirable specimen of 16th-century timber-framed building in Germany is not only exceptionally rich and refined in its detail, but it is unusually interesting on account of the arcaded treatment of the ground-floor story of its façade, giving the building somewhat of the character of an old market-house. Whether this arcade was originally intended to be open to the street is not quite clear, but probably it was built as it stands. The Rath-haus occupies a site in the middle of the ancient town, and is surrounded by similar quaint old half-timber buildings, though none are so rich, of course, in carved ornamentation. The date of 1579 figures in more than one place on the front, and the panel over against the entrance contains a representation of Justice holding the balance. Various inscriptions give enhanced interest to the horizontal timberings, and in a thoroughly characteristic fashion the carved elaborations extend through the joint lines of the construction, no serious attempt being maintained to observe the restrictions indicated by the framings and interspaces. The panels of the principal gable are finished off in plaster, thus giving increased value to the florid work on the smaller gable and lower stages of the structure, which, as a whole, gains breadth and quaintness by the uninterrupted series of windows along the main story. The spirit of Mediævalism pervades the whole design, which, in many ways, is eminently suggestive for modern use, though, of course, the difficulty of a low pitch to the stories, and vast roofing spaces over them, are very real to the architect when dealing with anything like a literal adaptation of the dominating lines of old half-timber buildings to the requirements of contemporary customs and conditions as to cost. We are indebted to Mr. Ernst Wasmuth for our illustration, which is taken from the admirable folio published by him in Berlin, under the title of "Denkmäler Deutscher Renaissance," with notes by Mr. K. E. O. Fritsch.

OFFICES OF THE SCOTTISH TEMPERANCE LEAGUE, GLASGOW.

THESE buildings are now completed on a capital site in Hope-street, Glasgow, from the designs of the architects, Messrs. James Salmon and Son. The walling is throughout of Dumfriesshire red stone, and the roofs are covered with Ruabon red tiles. The builders are Messrs. Shaw and Campbell, and the sculptor is Mr. R. Ferris. The drawing which we reproduce was exhibited by Mr. W. Forrest Salmon, the architect, in this year's Royal Scottish Academy Exhibition.

STALLEN FARM, COMPTON, SHERBORNE.

THIS farm-house is on the estate of Mr. J. R. P. Goodden, near Sherborne. The aspect and position of existing farm buildings largely controlled the arrangement of the plan. The stone used for the walling is from the quarries on the estate, and Ham Hill stone is worked for the windows, doors, strings, and chimneys. Broseley tiles cover the roofs, and oak timber grown on the land is used for the half-timberwork. Mr. Evelyn Hellicar is the architect.

LINCOLN CATHEDRAL FROM THE CASTLE.

THIS view is taken from a small round turret situated in the south-east angle of the castle. The prospect from this point is of the most charming description, as the spectator gets practically a bird's-eye view of the whole of this quaint city. In front of the cathedral we see the Exchequer Gate lying across the road; this is of Late Early English date, with later insertions. It is unfortunately placed, as it screens the west front of the cathedral, therefore making it impossible to obtain more than a very acute view of the whole. To the left of the cathedral can be seen the library built by Sir Christopher Wren in the cloisters; and to the right, amongst the trees, are the ruins of the bishop's palace. In the west front of the cathedral almost every period of English architecture is represented, from Early Norman to Perpendicular.

CHAS. H. HOLDEN.

THE PROPOSED OSTEND AQUARIUM.

(SEE description and illustration of the selected design on pp. 384-385.)

BUSINESS PREMISES, KINGSLAND.

THESE new business premises at Kingsland are from the designs of Mr. C. V. Johnson, architect.

CHIPS.

The Lord Mayor has consented to lay the foundation stone of the new Caxton Convalescent Home at Limpsfield, Surrey, on Saturday, 8th prox. Mr. J. Passmore Edwards, the president, who will accompany the Lord Mayor, has generously given the building.

The Dewsbury Town Council on Friday appointed Mr. J. B. Mitchell, of Bradford, electrical engineer, at a salary of £180 per annum. There were sixty applications.

The Willington local board of health has instructed Mr. D. Balfour, M.Inst.C.E., of Newcastle, to inspect the district and prepare a scheme of sewage disposal to prevent the pollution of the River Wear, under notice from the County Council.

The water and sewers committee of the Swansea Corporation have been engaged during the past week in preparing the case of the corporation in the arbitration over the Upper Lliw Waterworks, where the contractors claim £67,000 as extras. The arbitration was opened in London yesterday (Thursday).

The first cargo by the Manchester Ship Canal to Barton was deposited on Friday at the wharf erected for the Eccles Corporation, and consisted of 150 tons of granite setts from Newry.

The rural sanitary authority of Tiverton have adopted a scheme prepared by Messrs. Siddells and Barrons for the sewerage of the village of Uffculme at an estimated cost of £1,350.

The Princess Louise will visit the Potteries on October 15th for the purpose of inaugurating the important additions that have been made to the Free Library and Technical Schools at Burslem, which were undertaken as the local celebration of the Queen's Jubilee.

The front hall and staircase at Hawarden Castle have just been redecorated for Mr. Gladstone by Mr. Glyn Edwards, by whom the neighbouring church of Penymynydd was restored last year.

The Taunton Town Council have decided to apply for a further loan of £300, for laying out the park (making a total of £6,000 spent in this direction), and for £5,000 for extending the electric-light undertaking and establishing two sub-stations.

A cricket park, six acres in extent, has just been presented to the burgh of Arbroath by the owner of Lochlands, the town clerk of Arbroath.

WAYSIDE NOTES.

FROM the "house list" nominations just issued by the Society of Architects, I see that Mr. Edwin J. Hamilton, of Brighton, who has served the society on the council and as vice-president, will be the new president in succession to Mr. George Highton, who has proved an excellent and energetic chairman. Mr. George Baines is again nominated to serve as vice-president, with Mr. Ernest Day, J.P., of Worcester; and the suggested names for the council are Messrs. William Allport, C. A. Bassett-Smith, Robert Cruwys,* J. W. Fraser,* H. J. Jones,* Robert Keith,* G. A. T. Middleton, A. Stoner, George Thomas,* Edward Tidman,* and Silvanus Trevail,* an asterisk denoting fresh blood. Mr. Ellis Marsland will be again asked to serve as hon. secretary—no better choice could be made—and Major F. Seymour Leslie, R.E., will take Mr. C. E. Gritton's place as hon. corresponding secretary. Mr. H. G. Quartermain becomes treasurer in succession to Mr. E. Tidman, and Mr. S. C. Johns hon. auditor. Additional nominations for council and officers may be made by any three members, who must send in their nomination, properly signed, to the council before Monday week, the 1st October.

A circular has been issued by the committee recently formed to resist the Bath Tax which the Water Company in Lambeth is attempting to extort from its customers, pointing out to the inhabitants the necessity of subscribing to the fund which has been formed in order to test thoroughly the legality of the extortion. As the Law Courts have decided that the vestries may not devote money to the protection of the ratepayers, the ratepayers must protect themselves. At all events, if they refuse to contribute a small sum to have the question thoroughly decided—for up to the present that has not been done—they must make up their minds to pay not only the ten shillings which the company at present demands, but to be skinned in the near future. The appetite of a monopoly always grows by what it feeds on, and we fully expect to see the London water companies charging a shilling a pint one of these days for the fluid ladled out to their customers, if Parliament or the L.C.C. does not intervene.

The conference upon hardy trees and shrubs, which is to be held in Chiswick Gardens on Tuesday, under the auspices of the Royal Horticultural Society, should prove of value. It is specially wished that specimens in the shape of branches of trees and shrubs not generally known, and remarkable either for their economic value, ornamental aspect, or both, should be well in evidence, the desire being to direct greater attention to the ornament and utility of the trees and shrubs which are to be found growing in the British Isles, and of which many are claimed to have been introduced by the Royal Horticultural Society's collectors. Landscape gardeners and architects are alike interested in this matter.

The almost constant movement of the foundations of the salt district of Northwich was during last week of a most pronounced character, and as a result a startling collapse has occurred in Leicester-street, one of the principal thoroughfares of the town. In the small hours of the morning the gable, back walls, and ceilings of three cottages suddenly fell in with a crash, and the block will require rebuilding. Happily, the tenants were warned the night before, and quitted. On Saturday a serious landslip took place at Lostock, close to Northwich, on the premises of Messrs. Bowman, Thompson, and Co., Limited. One of their three brine-pumping stations entirely collapsed, an enormous body of earth, together with a valuable pumping engine and a quantity of materials, disappearing in a chasm 40ft. in diameter and some 20ft. deep. The occurrence had been anticipated to some extent, and in this case again the loss is confined to property.

Barbarism is as evident in the South American Catholic Churches as in the shrines of the misshapen idols of Hindooism. The weight of the solid silver altar railings in the Church of Our Lady of Guadeloupe, Mexico, is twenty-one tons. A new canopy has just been erected over the high altar, supported by monolithic columns of Scotch granite 20ft. high and 3ft. in diameter. The altar will be ready for dedication in December; but the ornamentation of the church will not be completed for about two years. It is described by a St. Louis newspaper as "palatial," and will undoubtedly be about the most remarkable specimen in the world of misapplied wealth and coarse, barbaric Hispano-American taste.

Professor John Goodman, the head of the Engineering Department of the Yorkshire College at Leeds, in a letter in the *Leeds Mercury*, exposes the common fallacy that stone stairs are safer in cases of outburst of fire than those of wood. As he says, experience shows that stone is often the first material to fail in a structure in the case of fire. As soon as the fire begins to play upon the thin slabs of stone, such as are used for stairs, they crack, and down they come with a crash. At the recent great fire under the Dark Arches at Leeds, it was noticeable that the stone facings had all crumbled away and perished, whereas the surrounding brickwork was but little damaged. Professor Goodman's opinion is that iron or steel stairs, encased with coke breeze or broken-brick concrete, make by far the safest staircase in the case of fire. Strange as it may seem, wood is not infrequently used for protecting iron and steel against the action of fire, and with excellent results.

The suggestions that have been made at various times to open the tumulus on Parliament Hill (the traditional burying-place of Queen Boadicea), to find out what it really contains, may shortly be acted on, as I hear that a committee of the London County Council has been appointed to consider the subject early next month. Archæologists will follow the result of the committee's deliberations with interest. Whether the "British Warrior Queen" lies still in the heights that have been secured for ever as London's northern playground or not, there is little doubt that something of interest will reward the explorers.

The foundation-stone of Embo Pier, near Dunrobin, N.B., was laid by the Duchess of Sutherland on Tuesday. The pier is to be constructed from designs by Mr. Barrow, C.E.

A new Baptist church, known as the Spurgeon Memorial Temple, was opened in Hone-street, South Leith, on Tuesday. The building has cost £2,500. The church is seated for 500, and above it—in the upper part of the building—house accommodation is found for the pastor.

At St. Peter's Church, Draycott, on Tuesday, the dedication took place, by Bishop Bromby, of a chancel screen, given by Miss à Court Beadon, in memory of her father, the late Rev. Richard à Court Beadon, Prebendary of Wells, and vicar of Cheddar. The screen, which was designed by Mr. G. H. Fellowes Prynne, and manufactured by Messrs. Singer, of Frome, is of wrought iron, and is supported on dwarf walls of Pennant stone.

For the vacancy on the Court of Common Council for Bishopsgate Ward, caused by the death of Mr. J. Hammack, architect, there were nominated, on Wednesday, Mr. Albert Edward Pridmore, M.S.A., of Broad-street Buildings, architect, citizen, and freeman, and Mr. W. B. Whittingham, of Bishopsgate-street Within, stationer and printer. Mr. Alderman Davies, who presided, declared the show of hands to be in favour of Mr. Pridmore, whereupon a poll was demanded. A vote of condolence with the family of Mr. Hammack was passed.

The ancient preaching-cross in the High-street of Leighton Buzzard, which has been in undisputed possession of the inhabitants for 500 years, which was restored in 1620 by a levy upon the whole population, and in 1852 by public subscription, has been claimed by the lord of the manor (Sir W. Hammer) who owns the Town-hall close by. Despite the protests of the local Public Lands Trustees, the ancient structure is to be offered for sale by auction, as part and parcel of the Stockgrove estate. The cross is a pentagonal Gothic structure, supposed to have been erected in the reign of Edward III.

Among the Bills which the London County Council propose to introduce to Parliament next session will be one authorising the reconstruction of Vauxhall Bridge. Lambeth Bridge will not be similarly dealt with at the same time, but at no very distant date that will also have to be rebuilt, and the proposal is to put up a temporary wooden bridge across the river, to serve first for the Vauxhall traffic and afterwards for that at Lambeth. This temporary structure will be carried across the river just in front of the National British Gallery which Mr. Tate is building on the site of the old Millbank Penitentiary, and will be about midway between the two existing bridges.

OBITUARY.

Mr. Robert Hutchinson, F.R.I.B.A., of Huntingdon and St. Ives, died on Tuesday, the 11th inst., at his residence in the former town, aged 66 years. He was a pupil of the late C. J. Richardson, and carried out a large number of works in the Fen districts, including laying out the cemeteries and designing the buildings therein at Huntingdon, Ramsey, and Whittlesea, the Militia Barracks and George Hotel at Huntingdon; additions to Hinchinbrook House, the seat of the Duke of Manchester; and many works of church restoration. Mr. Hutchinson, who had held the appointments of county surveyor for Hunts and borough surveyor of Huntingdon, joined the Institute of Architects as a Fellow half a dozen years ago.

Mr. James Rawlence, F.S.I., of Bulbridge House, Wilton, the founder and head of the firm of land agents and surveyors Rawlence and Squarey, of Salisbury and London, died, from acute bronchitis, on Saturday, in his 85th year. Mr. Rawlence, who was widely known for his Hampshire Down sheep, was a member of the council of the Royal Agricultural Society, and had been a Fellow of the Surveyors' Institution since February, 1870.

Mr. A. B. Cross, one of the oldest architects in the Western States, died a fortnight ago in Kansas City. Mr. Cross was born in New Jersey, but settled in St. Louis nearly fifty years ago, and was for a time associated with Mr. Thomas Walsh. Afterwards he went to St. Paul, but soon returned to Missouri, and, after a short stay in St. Louis, moved to Kansas City. Here he had lived for thirty-six years, during which the town had grown from an insignificant settlement to a great city. He was much employed on important work, and was for many years conspicuous in the profession in the West.

CHIPS.

The memorial stones were laid at Stocksfield on Saturday of a new Wesleyan chapel, now in course of erection from plans by Mr. T. Leslie Anderson, M.S.A., Newcastle-on-Tyne.

Mr. G. C. Benn, who two months ago offered to defray the entire cost—estimated at £2,000—of the erection of new schools in St. Andrew's, Rugby, has offered another gift to the town. A number of years ago the parish church was restored; but the spire, which it was originally intended to erect, was not added, and now Mr. Benn has undertaken the cost of completing the chrch with tower, spire, and vestries. The cost will not be short of £10,000.

The Archbishop of York will open the new and extended buildings of the High School for Girls at Hull on Thursday next, the 27th inst.

There was landed on the quay at the Coburg Dock, Liverpool, on Tuesday, a very fine log of mahogany, which has been sent from West Africa as a present for the Prince of Wales. The log, which is about 40ft. long and about 3½ft. in diameter, was shipped for Liverpool at Axim, on the Gold Coast, the shipper being described in the bill of lading as Prince Kueku Edukuma, and the log is a gift to the Prince of Wales. What will he do with it?

The addition to the Chapel Royal, Whitehall, erected from the designs of Messrs. Ingress Bell and Aston Webb, is now structurally complete, and is receiving the curious and closely-packed collection of the United Service Institution, for which it will serve as a museum, as well as providing a technical and general library, a lecture theatre, smoking-room, reading-room, and buffet.

At Manchester Town Hall, on Tuesday, Mr. Rienzi Walton, C.E., held an inquiry touching the application of the city council for sanction to borrow £9,000 for market purposes, and £5,000 for the purchase of land in Mount-street, Red Bank, and the erection thereon of public baths.

It is reported that some Baltimore (U.S.) capitalists have purchased the Eiffel Tower. It is to be removed, and re-erected at Baltimore for the centennial celebration of that city, which is to take place in 1897.

During the progress of the restoration of St. Mawgan-in-Meneage Church, a building chiefly of 15th century date, part of a 13th century lancet window has been found cased up in the south chancel wall. Mr. E. Sedding, the architect, has decided to restore it. A 15th century window in the east wall on the south transept was found bricked up, with a hole left in the middle to take the smoke from a fireplace, belonging to a modern vestry, built against this transept. A stoup of Early 13th century character has also been opened out in the porch.

COMPETITIONS.

Babington, Cheshire.—In a limited competition for proposed Wesleyan church and schools, the plans of Mr. T. Taliesin Rees, A.R.I.B.A., architect, of Birkenhead, were selected, and the carrying out of the work intrusted to him. The style of the buildings is Late Gothic. The materials are of red pressed bricks, with white local stone dressings and tracery. It is the intention of the committee at present only to erect the school-chapel, which contains seating accommodation for 250 adults, minister's vestry, two classrooms, kitchen, w.c.'s, lavatory, &c. The future church has been arranged to seat 600 adults, with church-parlour, vestries, organ-chamber, &c.

Llandudno.—At the last meeting of the Improvement Commissioners, a committee reported that Mr. T. M. Lockwood, F.R.I.B.A., Chester, the assessor, had minutely examined the thirty-three designs submitted in competition for new municipal buildings, and in making his award he had carefully studied convenience and economic arrangement, extent of accommodation, successful treatment as to light, sanitary arrangement, and general adaptability to the municipal requirements, also comparative cost combined with artistic merit, and after taking all these matters into consideration he had selected two. He expressed his opinion that the sum of £10,000, placed at the disposal of the competitors, was not adequate to the accommodation asked for, if the arrangements were to be such as are general in good municipal buildings, and this difficulty had become accentuated by the fact that the particulars governing the competition did not show that the land upon which the buildings would be erected (now used as garden land) is some 2ft. below the level of the adjoining roadway. The surveyor was directed to examine the two sets of plans above mentioned, and to report to the committee thereon, and that the names of the competitors be not disclosed until the board have dealt with the award of Mr. Lockwood — Mr. Caraher protested against the plans selected by Mr. Lockwood being examined by the engineer, who was not an architect.—The Chairman pointed out that Mr. Lockwood was merely asked to recommend one or two of the plans, the final selection resting with the commissioners. The engineer was prepared with his report, which he suggested should be read to avoid further delay in making the award, as the competitors were complaining.—The engineer (Mr. Stevenson) read his report on the two designs, which placed the cost of the first selected by the assessor at £10,800, and of the second, which was not equal to the first as regarded local requirements, although a good plan, at £10,570. He strongly supported the selection made by Mr. Lockwood. —Mr. Caraher considered that both designs were out of court, as the sum of £10,000 had been exceeded.—The engineer said that the author of the first design estimated its cost at £9,939 10s., and that of the second was set down at £10,050. Some of the plans which had been sent in for competition could not, he was sure, be executed for £15,000. The proposal for adopting the assessor's report was agreed to, eight out of the seventeen commissioners not voting. The winner of the first premium of £50 proved to be Mr. T. B. Silcock, A.R.I.B.I., Octagon Chambers, Bath, and of the second Mr. John H. Curry, A.R.I.B.A., Sutton, Surrey.

Woolston and Itchen Ferry.—The South Stoneham rural sanitary authority received at their last meeting a report from the joint committee intrusted with the subject of the drainage of Woolston and Itchen Ferry, near Southampton. It stated that twelve schemes had been sent in, and of these Mr. James Mansergh, M.Inst.C.E., who was called in to advise them, had selected two—"Health with Economy" and "A. Z." These were reserved for further consideration by Mr. Mansergh, whose report to the committee detailed the merits and demerits of each of the twelve schemes. "Health with Economy" proposed a small pumping area, the sewage to be lifted by gas power, and the whole to be treated in precipitation tanks. After the tank effluent had passed through polarite filters the final effluent was to be turned into the gravel near Jurd's Lake, the sludge being pressed into cakes. "A. Z." proposed an outfall 100 yards north of Jurd's Lake, and gravitated the sewage of nearly the whole of both districts there, the sewage to be pumped from the low level at Itchen into the gravitation sewers by gas power, the whole to be treated chemically, the sludge pressed into cake, and the effluent turned into that part of the stream from Jurd's Lake which crossed the foreshore. The cost of the scheme by "Health with Economy" was estimated at £12,312, and that of "A. Z." £12,676. Mr. Mansergh stated that the two schemes were almost identical, but he recommended the committee to accept the scheme "A. Z.," as amended by the author since he had communicated with him, as he believed it would have the best chance of success with the Local Government Board. The committee recommended that the report of Mr. Mansergh be adopted, subjected to the confirmation of the Local Government Board. The report was adopted, and on breaking the seals it was found that the author of "A. Z." was Mr. F. Wentwood Shields, of Brentwood House, Sholing, Herts, and that of "Health with Economy," Mr. H. J. Weston, M.Inst.C.E., of Southampton.

CHIPS.

The town hall of Verdun, France, containing many valuable works of art, has been destroyed by fire. The museum, situated in a wing of the building, was almost completely burned out, but the records were saved.

On Tuesday week, at the offices of the local board, Kingston, Mr. T. Codrington attended and held an inquiry as to the board's application to the Local Government Board for sanction to borrow £650 for the purpose of relaying and enlarging the water-mains in the town.

A marble bust representing the late Mr. J. R. Pine-Coffin (1842-90), of Portledge, near Bideford, has been placed on a granite pedestal and fixed in the garden at the south-east corner at the end of the Bideford Bridge, immediately on entering the town. The bust has been executed in Sicilian marble by Mr. F. J. Williamson, of Esher. The pedestal was made by Mr. Baker, of Bideford. The unveiling ceremony was performed on Wednesday week by the Lord Lieutenant of Devonshire, Lord Clinton.

"Old Antwerp," which is one of the great successes of the present Antwerp Exhibition, is to be permanently rebuilt in brick and stone between the old Palais de l'Industrie and the Southern Railway Station. The necessary capital of £120,000 has been subscribed, a concession for sixty years has been secured, and 160 buildings, large and small, are to be erected, chiefly after the plans of M. Eugène Geefs, the architect of the present "Old Antwerp." The existing Palais des Fêtes, which will be included, will be turned into a Civic Historical Museum.

The partnership heretofore subsisting between R. Dickinson and A. S. Paterson, architects and surveyors, John-street, Adelphi, W.C., under the style of Dickinson and Paterson, has been dissolved.

The directors of the West Highland Railway Company have resolved to deposit a Bill in Parliament next session for the extension of the West Highland line to Inverness.

The Board of Trade return for September states that, on the whole, a slight improvement is observable in most branches of the building trades, though, as a rule, the painters and plumbers are still moderate. The percentage of unemployed in unions connected with these trades has fallen from 3·6 to 3·4. The furnishing and woodworking trades remain moderate in most branches, the percentage of unemployed in unions making returns having risen from 4·4 to 4·8. Only twelve disputes are reported to have occurred in the building trades during the past month.

The monument erected in St. Stephen's Cathedral, to commemorate the raising of the Siege of Vienna by John Sobieski, the King of Poland, in 1683, was inaugurated on Friday in presence of the Emperor Francis Joseph.

Major-General Phipps Dacre, Local Government Board inspector, held an inquiry at Southport on Thursday in last week, in regard to an application by the Southport Corporation for power to borrow £2,900, for the laying out of a new recreation ground and other purposes. The town clerk explained that the recreation grounds were to be established at the Duke and Crowlands end of the town. The population of the borough was 45,000. No opposition was offered to the application.

Memorial stones were laid on the 13th inst. in the new Sunday-schools being built for Albany Primitive Methodist Chapel, Shaftesbury-avenue, Bristol. The buildings will comprise a schoolroom 45ft. by 30ft., capable of seating 250 adults or 300 children in classes, an infant school, 20ft. by 15ft., and several classrooms, some of which can be thrown into the large room by the removal of partitions. The total cost of the structure, for which Mr. J. H. La Trobe, F.R.I.B.A., of 20, Clare-street, Bristol, is architect, will be about £1,000.

Engineering Notes.

The Proposed Manchester, Newcastle, and Glasgow Railway.—A meeting of the provisional committee in connection with the proposed railway from Manchester to Glasgow *viâ* Newcastle and Hawick was held at Carlisle on Friday. There was a very full attendance, and after a prolonged discussion it was decided to instruct the engineers in chief to go over the proposed route, starting on Monday. Immediately on their reports being received the surveyors will be started, and the deposits lodged with the Parliamentary agents by the 30th of November. It was agreed to increase the preliminary expenses fund, in order that the bill for the entire line may be prepared. The engineers who are inspecting over the route this week are Sir George Barclay Bruce, Sir Douglas Fox, Mr. Robert Elliot Cooper, Messrs. James Livesley and Son, London, and Mr. Charles Forman, Glasgow.

Cessnock Docks, Glasgow.—About three-fourths of the works in connection with the new docks at Cessnock, for the Clyde Trustees, have now been completed. The undertaking, which has been four years in progress, comprises the formation of four basins and a new graving dock, which latter, when finished, will be the largest in the world. The total area occupied by the docks is about seventy-five acres; thirty-five acres being taken up by water space and forty acres by quayage and dry dock. Of the four basins—one an outer canting basin 1,100ft. long, and three inner basins, each 1,200ft. long—the north basin of the latter group, the one nearest the river, has been complete for about ten months. The centre basin will have its quayage complete in about a month's time, and four months subsequently the basin will be dredged out and ready for the reception of shipping. In this way 9,000ft. of additional quayage accommodation will be available at the harbour of Glasgow. The quay wall forming the west boundary of the group of basins is now also complete, and sheds are being erected upon it, as well as the foundations for the Trust's new 130-ton crane recently ordered from Messrs. Cowans, Sheldon, and Co., of Carlisle. The remaining, or south, basin has also been begun, and will be finished in about two years. In the completed north basin there is a depth at low water of 20ft., and at high water of 31ft. The centre and south basins are to have a low-water depth of 25ft. and a high-water depth of 36ft. In the outer or canting basin, through which approach is had to the several other basins, the depth is to be 28ft. at low water and 39ft. at high water. The several quay walls, which are constructed on the concrete cylinder principle, are founded in sand mostly at a depth of from 55ft. to 58ft. below the cope level. On the top of the concrete cylinders is a superstructure of granite, 20ft. in height, faced with concrete and granolithic. The contract for the hydraulic machinery has been taken by Messrs. Fullarton, Hodgert, and Barclay, of Paisley. Work at the docks has been kept going night and day, the number of men employed being about 600. Since the beginning of operations two and a-half millions of cubic yards of earth have been dug out, and some three million cubic yards more will have to be dug and removed ere the works are complete. The new graving dock is to have a total length of 900ft., a width at the entrance of 83ft., and a depth of water on the sill at high water in spring tides of 27ft. The body of the dock will be 115ft. wide at top, 74ft. wide at bottom, and have a depth of 28ft. The length of dock will be 880ft. The two present graving docks are only 560ft. and 575ft. in length respectively, and 72ft. and 65ft. across the entrance, with a depth of water of 23ft. The total cost to the Clyde Trustees of the Cessnock Docks works is expected to amount to £1,250,000. The works are being carried out by the Clyde Trustees' own workmen, under the direction of Mr. James Deas, civil engineer to the Trust, and his assistant, Mr. A. Hamilton.

The Sheffield and London Railway.—The contracts for the construction of the new railway which is to connect the Manchester, Sheffield, and Lincolnshire system, from a point a few miles south of Sheffield, with the Metropolis have now been let, and the work on the whole length will be immediately started and hurried forward. There were in all six contracts for the 92 miles of railway, and a seventh comprised the works within London. No. 1 contract commences with the existing Sheffield Railway at Annesley, and terminates a little south of East Leake, extending for about eighteen miles, and passing through the town of Nottingham, where the railway will be in tunnel through rock. This length has been let to Messrs. Logan and Hemingway, Sheffield. The next 15 miles, comprised in No. 2 contract, begins at East Leake, and passing through Loughborough and Leicester, where there are heavy works, terminates at Ayleston, a few miles to the south of the latter town. This part is to be constructed by Mr. H. Lovatt, Wolverhampton. The third contract, undertaken by Messrs. Topham, Jones, and Railton, Great George-street, S.W., carries the line 19 miles further south from Ayleston, through Lutterworth, to within a short distance of Rugby. These three contracts, extending to about fifty-two miles, will be under the direct control of Mr. Edward Parry, M.Inst.C.E., Nottingham, while Sir Douglas Fox himself and Mr. Francis Fox will personally direct the works on the remaining 40 miles to Quainton-road, as well as the works within the Metropolis. From Rugby to Charwelton, a distance of about fifteen miles, the line will be constructed by Mr. Thomas Oliver, Totley, near Sheffield. On this length there is at Catesby a tunnel about 3,000 yards long, while at Rugby there is a large viaduct over the main line of the London and North-Western Railway. The two contracts comprising the work between Charwelton and Quainton-road on the Aylesbury and Buckingham line of the Metropolitan system —a distance of about twenty-five miles—are to be carried out by Mr. J. T. Firbank, of London Bridge. The terminus in London is to be in Marylebone-road, and a connection from the Metropolitan system is to be carried through St. John's Wood and Lord's Ground, the length being about four and a half miles, which is entirely in tunnel or cut and cover, costing about £550,000. The contract for this length, including the terminal station and hotel, is about to be let, and this difficult part of the work will at once be proceeded with at various points. It comprises also a heavy bridge over the Regent's Canal.

Surrey Commercial Docks.—Important improvements are about to be made to these docks to fit them for modern requirements, the ultimate cost of the entire scheme being estimated at £220,000. The canal lock of the Surrey Company, which was built in the early part of the century, will have to be reconstructed, owing to the altered character of the vessels using the docks. In former years the timber trade—for which the docks on the south side have always been the home in the Port of London—was carried on exclusively in sailing ships, and it was not until 1872 that steamers were employed in the trade. Since that year the tonnage of vessels entering the Surrey Docks laden with wood has increased from 2½ per cent. to about 75 per cent. of the total tonnage. The works now contemplated include the reconstruction of the Greenland Lock (formed in 1808) with a wider outlet to the Thames, and the making of a new canal lock to complete the junction of the two systems commenced by the construction of the Canada Dock. In July last the Royal assent was obtained to a Bill which sanctions these works and empowers the directors to raise further capital to cover the estimated outlay. It is proposed to carry out the improvement in sections, the new canal lock being the first to be undertaken. Plans have been prepared by Mr. J. A. M'Connochie, the company's engineer, and the contract, which will involve an expenditure of between £50,000 and £60,000, will be forthwith entered upon.

The members of the Hampshire Field Club made their last excursion for the season on Friday, the 14th inst., when the Roman city of Silchester was visited, and also Bramley Church, which contains some interesting mural paintings.

The local board of Whitworth, near Rochdale, are about to carry out extensive works of sewerage, from plans by Messrs. Hinnell and Murphy, of Bolton, including the construction of an intercepting sewer from Tonnacliffe to Shawforth, and main and branch sewers in Whitworth, Facit, and Shawforth.

At a meeting of the Willington local board of health, Mr. J. Allison presiding, it was agreed to ask Mr. D. Balfour, M.Inst.C.E., of Newcastle-on-Tyne, to inspect the district, and prepare a scheme of sewage disposal to prevent the pollution of the river Wear, under notice from the county council.

Building Intelligence.

Bamber Bridge, Preston.—On Saturday afternoon Dr. Moorhouse, the Bishop of Manchester, laid the foundation-stone of the church of St. Aidan, Bamber Bridge, to be erected at an estimated cost of £5,000. The building, which was illustrated by plan, section, elevation, and perspective in the Building News for Feb. 23 of this year, is being built from designs by Mr. R. Knill Freeman, of Bolton and Manchester, selected in competition. The style is Late Decorated, and at present the east end, transepts, and first three bays of the nave will be built. The walling is of Yorkshire stone parponts, with designs of red Rainhill stone, and the roof will be covered with green tiles. The internal walls of chancel will be plastered, while in the other portions of the church red brick will be used for facings.

Bury, Lancs.—The technical school which has been built by the Bury Corporation between Broad-street and Moss-lane was opened by Earl Derby on Saturday. The building occupies an area of 1,830sq.yds., and adjoins the proposed art gallery and library. The treatment is Classic, with Renaissance ornamentation, and the main façade is of dressed Cullingworth stone, the side fronts being of red pressed bricks from Accrington, with stone strings and dressings, and the roofs are covered with Westmoreland slates. Over the windows in the principal façade are four stone panels of large dimensions, filled with sculpture in bold relief, representing various manufactures, the arts and sciences, history, painting, geography, shipbuilding, and different industries. In the centre of the building at the rear is a campanile shaft 100ft. in height. In the basement are the physical laboratory, science lecture theatre, dye stuffs and plumbing classrooms, and the gas-engine and dynamo rooms. On the ground floor are the chemical lecture theatre, the largest room in the building, cookery lecture theatre and kitchen, mechanics' and carpenters' instruction room and textile instruction room, women's lecture hall, and committee-room. On the first floor are the art classrooms, 74ft. by 24ft., and three other classrooms, and over these are another art classroom, 46ft. by 23ft., and a modelling room. On the main staircase is a Lancashire window of thirty large lights filled with coats-of-arms and badges of families connected with the county. Mr. J. Cartwright, C.E., the borough engineer, has designed and planned the buildings, &c. The various works have been let under separate contracts. The bulk of the work has been executed by Bury contractors. Appended is a list of the chief contractors:—Brickwork, Mr. Cammack Dennis, Bury; stonework, Mr. F. Nuttall, Whitefield; joinery and carpentry, the Bury Sawmill Company, Bury; plumber's work, Mr. R. Caton, Bury; plasterer's work, Mr. J. Ramsden, Bury. The other contractors are: Concretor, Mr. R. L. Lowe, Farnworth; electric lighting, Messrs. Heywood Bros., Manchester; gas-engine, Messrs. Andrews and Co., Stockport; wood block floors, the Wood Block Floor Company, London; fireplaces, urinals, lavatories, and faïence work, Messrs. Doulton and Co., London; ventilators, Messrs. J. H. Pickup and Co., Bury; mosaic floors, Messrs. Minton and Co., London; pavement lights, Messrs. Hyatt and Co., London; mica flap ventilators, Messrs. Hayward and Co., London; stained and painted glass, Messrs. Seward and Co., Lancaster; iron girders and roof, Messrs. J. Webb and Son, Bury; desks and seats, Mr. John Heywood, Manchester; ornamental staircase, the Coalbrookdale Co.; carving and sculpture, Mr. J. B. Whittick and Mr. J. J. Millson, Manchester. The excavations, &c., have been done by the corporation's own workmen. Mr. George E. Smirk was the clerk of works. Exclusive of cost of land and furnishing, the outlay has been £16,000.

Cheetham Hill, Manchester.—The memorial stones of a new Wesleyan church which is being built in the Wilton Polygon, facing Bury Old-road, Cheetham-hill, were laid on Saturday afternoon. The church—of which Messrs. William Waddington and Son, St. Ann's-square, Manchester, are the architects—is designed in the style of English Gothic which prevailed at the end of the 14th century. The main gable will be flanked by octagonal buttresses terminating in pinnacles, and the porch will also be in projection. The church is being built in stone, and will consist of a broad nave with lateral arcades, and there will be transepts to the north and south, and a spacious chancel, and a spire rising to the height of 150ft. Within the building will be included a minister's vestry, a choir vestry, two classrooms, a large lecture hall, and a church parlour. The church will seat about 900 people, and the total cost is estimated at £11,000. Messrs. R. Neill and Sons, of Salford, are the contractors.

Craighall, Perthshire.—Important structural alterations and additions have recently been made to Craighall Mansion, the seat of Lieut.-General Clerk-Rattray, C.B., from plans prepared by the late Mr. Andrew Heiton, of Perth. Hitherto the principal front of the house has been exceptionally plain, the chief façade being that overlooking the river Ericht. This has been remedied, as a massive battlemented tower has been added at the west end of the building, both back and front. Beneath this tower, and towards the centre, is the principal entrance, which is subdivided by two stone pillars. The lower part of the tower is built of red stone from Keithick Quarry, and the battlements at the top of a lighter red stone from Dumfries, the remainder being whinstone from Newburgh. The additions extend round to the back, and add in a striking manner to the appearance of the building, perched upon the top of a rock some 250ft. above the river Ericht. The increased accommodation afforded by the additions include, besides servants' rooms, a smoking-room and entrance hall. A new entrance to the stables and other improvements have also been effected. This is probably the fourth important addition or alteration made upon Old Craighall since the family removed there from Castlehill, Rattray, over 300 years ago.

Falkirk.—On Saturday the memorial stone of the new church at present being erected by the Falkirk Free Church congregation was laid. The church, which is being built in New Market-street, from plans prepared by Mr. James Strang, architect, Falkirk, is in the Gothic style, and will have a spire of about 130ft. in height. Accommodation is to be provided for 940 sitters. There will also be attached a hall 51ft. by 25ft., which will be seated to accommodate some 300 people. The session house will be 23ft. by 19ft., while the vestry will be 11ft. by 12ft. There will be two waiting rooms—one 19ft. by 14ft., the other 14ft. 6in. by 13ft.—which will also be suitable as classrooms. The estimated cost is £5,700.

Fenton, Staffs.—The chairman of the Stoke-on-Trent School Board recently opened a large block of new schools which have been erected at Heron Cross, Fenton. The site is an elevated one, situated on the Grove-road. The schools have been erected on the central hall plan, and at present accommodation is provided for 660 children; but five more classrooms can be added, giving further accommodation for 300 children. The central hall is 89ft. long and 44ft. 6in. wide, and is flanked on each side by three classrooms, whilst at one end four more classrooms are provided, each of the classrooms accommodating 60 scholars. Head teachers' rooms and cloakrooms are also provided. The buildings are of brick, relieved with stone dressings, with tile roofing. Inside, the ceilings and walls are plastered, the latter having also a tiled dado round them. The schools are heated on the high-pressure system, and are ventilated on the automatic system with Tobin tube inlets and Boyle's extractors. They are artificially lighted on the Stott system. The total cost has been about £6,300. The architects were Messrs. R. Scrivener and Sons, of Hanley, and the contractors Messrs. H. and R. Inskip, of Longton. The tiles for the dados were supplied by Messrs. Minton, Hollins, and Co. of Stoke, the heating apparatus by Messrs. Jackson and Sons, of Birmingham, and the general fittings by the Bennett Furnishing Company, Glasgow.

Leeds.—A new Wesleyan chapel to be known as Trinity, in Roundhay-road, Leeds, was formally opened on Saturday. The structure, including the site, has cost £8,320; it is faced with pressed bricks, and is in the Italian style. Mr. G. F. Danby, of Leeds, is the architect, and he has also superintended the execution of the work. The church, 80ft. by 56ft. and 38ft. high, accommodates 900 persons. The vestibule is 31ft. long and 8ft. wide. The centre seats are straight, those at the sides circular, while the choir-stalls are on either side of the pulpit. The chancel is separated from the rest of the chapel by a moulded and carved stone arch, supported by granite columns, with carved caps and bases. The minister's vestry, a church parlour, and a ladies' workroom, are to be built hereafter between the school and the chapel. The contractors were Mr. Thos. Hannam, builder; Mr. Joseph James, joiner; Messrs. Lazenby and Co., plumbers; Mr. T. Moore, plasterer; and Messrs. J. and H. Smith, ironwork and warming.

Prestolee.—The large spinning mill which has been erected by the Irwell Bank Spinning Company, Limited, at Prestolee, was the scene of an interesting ceremony on Friday, when Earl Derby named the engines which had been put in by Messrs. E. and J. Wood, of Bolton, and which were described as the largest in any cotton mill in England, being of 1,800H.P. The mill will contain preparation machinery and 133,000 spindles in 116 mules, four-fifths of which will be used for twist and one-fifth for weft. The main building is 269ft. long by 133ft. wide, and six stories high, in addition to the basement. The total floor area of the building is 34,750 square yards, or over seven acres. The mill is fireproof throughout. The height of the mill from the surface of the river Irwell is 120ft. Messrs. Stott and Sons, of Oldham, were the architects, and Mr. Jonathan Partington, of Chadderton, was the contractor. The following are the sub-contractors:—Mason, Mr. Thomas Bebbington, Oldham; plumbing, glazing, and painting, Mr. John Kershaw, Heywood; plastering, Mr. Rothwell, Oldham; iron fixing, Mr. Thomas Ramsbottom, Rochdale; asphalting work, Messrs. George Atkin and Co., Liverpool; cast ironwork, Mr. George Chatton, Little Lever; and rolled steel girders, Messrs. Dorman, Long, and Co., Middlesbrough. The mill is heated by steam; there is an installation of Witter automatic sprinklers, and the lighting is entirely by electricity.

St. Germans, Cornwall.—The parish church of St. Germans, formerly a cathedral, was reopened by the Archbishop of Canterbury on Thursday in last week, after restoration. The church, which was illustrated by a sketch of the sedilia and stoup by Mr. H. A. Gribble in the Building News for June 17, 1870, contains work of every period from Norman to Perpendicular, and the works have been in hand over some six or seven years, and carried out under the direction of Mr. J. Piers St. Aubyn. The west end was dealt with first, and the two towers which flank the Norman porch were freed from ivy and restored, and a ribbed roof placed over the end of the nave. Next the south side was renovated, and a new roof of the old West Country wagon-headed type, with carved bosses and ribs, placed over the main fabric. Now, after an expenditure of some £6,000, the last stage of the restoration has been reached. The old pews have all been cleared out, and the floor has been lowered 14in., so as to display the bases of the Norman pillars of the arcade. The floor, which now rests upon 3in. of concrete and 1in. of cement, gives a height to apex of roof of 43ft. The span of the roof is 26ft. in the nave, and 28ft. in the south aisle, the arcade nearly dividing the church in two. A discovery made during the restoration shows that the south aisle was added to the old church, for on the wall space above the Norman arches were the remains of two clerestory windows, outside which there was formerly the lean-to roof of a smaller south aisle. The span of the roof of the chancel aisle on the south is some 7ft. short of the nave aisle, a fact which presented an architectural difficulty to the restorers. The whole of the structural work has been carried out by Messrs. T. Lang and Son, of Liskeard, and under the active superintendence of Mr. H. G. Luff, of Devonport, representing the architect. The church is seated throughout with chairs, the chancel aisle being specially arranged as a chapel for early morning and week-day services, with its own altar. The chancel is paved with a marble mosaic by D. Grill, Houndrett, and Co., of Wall-street, London; and the morning chapel is paved with marble by Goad and Sons, Plymouth, the passage-way being of white and black marble laid diamond-wise, and the steps being of Devonshire marble. The morning chapel is divided from the chancel of the church by a parclose screen, which, with the west roof bosses (all differing), choir stalls, and other carved work now inserted in the church, is the work of Messrs. Harry Hems and Sons, of Exeter.

Sydney, N.S.W.—The new portion of the Hospital was opened by Sir George Dibbs on August 10th. The hospital has a frontage of 360ft. to Macquarie-street, by a through depth of 346ft. to the Domain, its area being about three acres. The old buildings consist of the Nightingale block, the women's block, the kitchen and laundry blocks. The women's block is all that now remains of the buildings erected in 1857. It is of stone, two stories in height, and has accommodation for 72 beds. The Nightingale block was erected in 1868 to provide accommodation for the nurses, but has recently been utilised for male patients. The kitchen and laundry blocks were erected in 1881 as part of the new hospital scheme. The new buildings just completed consist of five blocks, designed on the pavilion system. The administrative block occupies a central position fronting Macquarie-street. To the left and right are the north and south blocks, and to the rear of the administrative block and on the central axial line are the east block and the operating block. The space between the various blocks is from 16ft. to 24ft., spanned on the upper-floor level by bridges and balconies. The administrative block has a frontage of 80ft. by a depth of 72ft. A stone staircase ascending from right and left in front gives access to the first floor, where are located the chief offices of the institution. The greater part of the ground floor of this block is appropriated to the out-patients. Here is the casualty ward, with waiting and examination room, and near by is the general lift, 9ft. by 7ft., which gives access to all the floors of the administrative block, and by means of the balconies and bridges, spanning the drive-ways, to all parts of the hospital. The principal entrance, a vestibule or loggia 15ft. by 10ft., recessed from the front wall of the building, is three stories high, and reached by a broad flight of steps. On either side of the entrance-hall are the board-room and office, each 35ft. by 25ft., and on the floors above are offices and bedrooms for the staff. The north and south blocks are 102ft. long, the east is but 87ft. 4in., being two bays shorter. The lavatories, bath-rooms, nurses' rooms, and staircases form externally transverse projections at each corner of the ward blocks, and between them extend the verandahs and balconies. The staircases are 6ft. wide, and are of wood, with brass nosing and rubber tread, newels, balusters, and handrail of cedar. The wards are eight in number, three in the north and three in the east block, and two in the south. Each ward of the north and south is 82ft. by 26ft., and accommodates 22 beds. Those of the east are 68ft. by 26ft., and contain each 16 beds. The total number of beds in the new buildings is 158. The height of the wards is 15ft. to 17ft.; the width of wall space is 7ft. 5in., and the cubic allowance per bed about 1,500c.ft. The windows are 2ft. 6in. wide and 7ft. high to the transom, which is fitted with double-hung sashes. Above are fanlights 2ft. high, pivot-hung. The lavatories contain each three w.c.'s, fitted with Jennings's pedestal vase closet. Verandahs and balconies extend along each side of all wards. Dust and linen shoots are provided for each ward block, and are placed on the balconies and verandahs. The whole of the floors of the three ward blocks are fireproof, being constructed with iron girders, trægerwelbleck and coke concrete. Other ceilings are of zinc, subdivided by mouldings. Tobin tubes are introduced with inlets 8ft. from the floor in each ward, and one of Verity's hydraulic fans is fixed in each ward block. Wenham lamps are also used throughout the wards. The wards on the top floor have perforated centres, communicating by galvanised iron flues with Boyle's ventilators on the roof. The new operating block is of two stories, built of brick and cemented externally. The chapel has a floor space of 32ft. by 30ft., and over this is the operating theatre of like dimensions, and is lighted from a domed ceiling. Mr. T. Rowe, F.R.I.B.A., of Sydney, whose designs were selected in competition, was the criginal architect for the extension, but owing to the increase of cost over the original estimate and political differences, Mr. John Kirkpatrick was appointed architect, and the work has been completed under his direction.

The members of the Selby Local Board of Health, together with the workmen employed in the gas department, and officials and friends, assembled at the Londesborough Arms Hotel, Selby, on Saturday evening, in order to commemorate the completion of the new telescopic gasholder recently erected by Messrs. Ashmore, Benson, Pease, and Co., contractors, Stockton-on-Tees. The works have been carried out under the supervision of Mr. M. Dunn, the gas manager and engineer to the local board.

Correspondence.

SHOULD ARCHITECTS ADVERTISE?

To the Editor of the Building News.

Sir,—A good deal of *sentimental stuff* is written on this subject, and also upon the remuneration of architects, and I presume "Observer" (in your last issue) is a young man who feels that he would like to have more work to do; but that it is *infra dig* to let people know that such is the case! At one time I could have had more sympathy with him; but after twenty-five years' experience I have arrived at the conclusion that everyone is justified to use all legitimate means of gaining his living so long as he does not act in any dishonourable manner to his neighbour! I have never advertised for work myself, as I do not think it would do any good; in fact, I believe it would do me more harm than good in *this* city. I know that a good deal of *touting* is done by a few men in the profession, and of one well employed man, who attends regularly at the Courts when publicans are applying for licenses, and who does not hesitate to solicit work from any of the applicants who are likely to require their premises improved or altered. Well, I do not suppose he would spent his time in doing this if it did not pay. As for remuneration, I am afraid that architects, like many more professional men, have sometimes just got to take what they can get. I know that firms in a Scottish city who have the best work and rich clients do not hesitate to put plans out of their offices for a remuneration of one per cent.—I am, &c., Honesty.

Sir,—I think "Registrationist" will find that very few architects of repute advertise in the manner named; the ones who do so being principally found amongst those who were originally carpenters or builders, &c. In fact it is very rarely that a good architect is sufficiently pleased with his work after its completion to have his name upon it in any shape or form. About two or three years ago I was rather amused at reading a report of the opening of a new board school wherein it was stated that the architect had his name upon a plate fixed in the lantern light; I cannot say I was surprised, as I have heard that the architect in this case was originally a carpenter.—I am &c., Non-Advertiser.

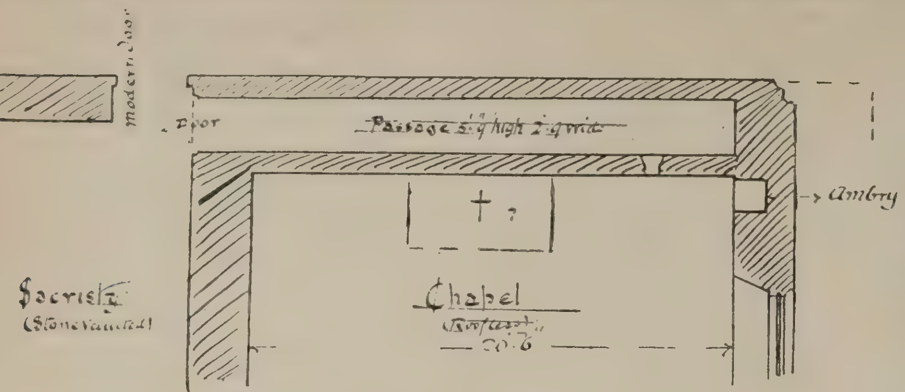
THE REGISTRATION OF CIVIL ENGINEERS.

Sir,—All educated civil engineers who have served as pupils, and studied their profession will be delighted at the information contained in your issue of the 7th, that the initials "C. E." have at last got a legal status as given by your correspondent "H. L." I am often asked by members of the legal profession what "C. E." means, and now I can inform them. Seriously, why should not civil engineers, like members of other professions, be registered, and the misuse of the title "C. E." made illegal? The Institution of Civil Engineers whilst being the leading professional body, although protecting itself, has not seriously moved to purge the whole profession of outsiders and quacks, who have neither served a proper term of pupilage, or gone through a college education in the profession. Some day or other the State may interfere, when it will be worse for those who now practise on the ignorance of the public and waste public money on public work. It ought therefore to be the business of all bonâfide civil engineers to have a Registration Bill for the United Kingdom, and a fixed course for all who are not on the register before 1896.—I am, &c.,

Alpha.

ST. LEONARD'S COLLEGE, ST. ANDREW'S, N.B.

Sir,—In the eastern gable of the ancient and ruined chapel of St. Leonard's College here, there are two passages, one above the other, in the thickness of the wall which are a standing puzzle to local ecclesiologists. The accompanying sketch shows a small part of the eastern end with the lower passage entering from the sacristy. The upper passage is immediately above, the separation medium being stone flags which form the floor of the one, and the roof of the other. Near the southern end of each there is a narrow opening into the chapel about 4in. wide and 2ft. high, which appear to have been glazed. The entrance to the upper passage is not at present very obvious, but may yet be found.



There is just a suggestion of a seat at the southern ends—especially in the lower one—and from these (if they did exist) the sitters could see into the interior through the small openings. What purpose did these curious passages serve, and can any fellow subscriber to the Building News say if anything similar exists elsewhere?

By way of explanation it may be said that in the beginning of the 12th century, we read of a hospital as belonging to the Culdee Community. By-and-by that was (somewhat by force) transferred to the Augustinian Canons, and used by them for the reception of pilgrims who came to worship the relics of St. Andrew in their wonder-working days. These ceased to draw, and by the middle of the thirteenth century we find the hospital dedicated to St. Leonard and filled with old women. They too became obsolete, and in 1512 the hospital and its property were taken *inter alia* to found a college for poor scholars. There appears good reason to believe that the eastern end of the chapel in which these passages occur was built at that time, as the arms of the founder Prior John Hepburn are on a buttress at the function of the older or hospital chapel and this new extension. It is conceivable that they were used for the purposes of espionage, but perhaps some reader can say?—I am, &c.,

David Henry, F.S.A.Scot.

St. Andrew's, September 10th.

CHIPS.

Mr. A. H. Franck-Clarke, assistant to Mr. C. Nicholson Lailey, C.E., Westminster, has been engaged by the Ystradyfodwg local board for main sewerage work in the Rhondda Valley.

The church schools, St. Anne's-on-the-Sea, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

At the last meeting of the East Grinstead local board a resolution was passed to apply to the Local Government Board for sanction to borrow £3,500, to build an infectious hospital, according to plans prepared by Mr. William Willis Gale, their surveyor; and also for £500 for works of permanent improvement on the main road.

The new Presbyterian church on the New-walk, Leicester, was formally opened on Tuesday week. As rebuilt, there is seating accommodation for 400 in the body of the church, and 50 in the gallery. The whole of the work, including the furniture of the church, the organ screen, and the table and chairs at the east end, which are in oak, has been carried out by Messrs. Hinson Bros., of Stamford, from the designs, and under the superintendence, of Mr. A. R. G. Fenning, F.R.I.B.A., M.S.A., of London.

An inquest was opened at Derby on Friday on the bodies of the five workmen who were killed on the 5th inst. through the fall of a floor during the process of pulling down the old Derbyshire Infirmary. The survivors of the men working with the deceased explained that, while they were in the basement of the corridor, the upper floor, composed of several tons of concrete, collapsed and buried them. It was alleged that the vibration caused by breaking the concrete floors induced the walls to bulge and the floors to collapse. One of the witnesses said the walls ought to have been shored, which precaution was not observed, whilst all agreed that it was dangerous to any men to work in the basement. The inquiry was adjourned.

The great exhibition of arts, which is to be held at Vienna in 1895, will be opened on March 22 of that year. A prize of £400 and two of £200 will be offered. The transport of works of art to the exhibition will be free.

Intercommunication.

QUESTIONS.

[11215.]—**Moorish Wall Decoration.**—I have recently visited Spain, and seen the Moorish art at the Alhambra, Seville, Cordova, &c. I shall be obliged to any reader who will inform me as to makers of tiles, Anaglypta fibrous plaster, &c., copying Moorish designs for wall decoration.—J. R. Collins, Bodmin.

[11216.]—**Flat Roof of Concrete.**—I have to construct a large cement concrete roof, about 25ft. span, in a country district where skilled labour is difficult to obtain. It is important that the roof be thoroughly watertight. There is plenty of broken stone for the aggregate of a sparry nature. I propose putting on a thickness of 6in. of concrete, floated with 1in. of cement mortar. Portland cement to be used in all cases. My experience of concrete roofs is that they crack in the neighbourhood of the girders. Would it be possible to put the roof on without them? Any practical hints that will enable me to construct an efficient and economical roof will be thankfully received. How much bullock's blood should be put to a bushel of cement to give a good colour for finishing cement floors?—Enquirer.

[11217.]—**Discharge of Pipes.**—Will one of your correspondents kindly show what would be the actual discharge of short 3in. pipes (*a*) as a vertical outlet from a tank (*b*), as a side outlet from a tank, each having 4in. of head?—Waterman.

[11218.]—**Plus Threads and Minus Threads.**—Will any reader kindly explain, by sketches and description, the difference between a "plus V-thread" and a "minus thread," as given in Science and Art examinations in building construction? Screw coupling joints, &c., had to be drawn half full size, with plus and minus threads.—Thread.

REPLIES.

[11210.]—**Lightning Rods.**—"Fassnacht Clayton," Manchester, is rightly informed that lightning conductors are sometimes dangerous. They certainly are when improperly put up and have insufficient earth connections, when they are badly insulated, when they are fixed near any ironwork without proper connection with the earth (all ironwork should be "earthed" independently), when there is only one or two points. No perfect safety can be insured unless the building is lined or protected by metal conductors carried along all ridges and gables. The reason is that an insufficient or improperly insulated conductor diverts the electric current and draws it to the building and thus invites damage.—G. H. G.

[11211.]—**Old Oak Furniture.**—It is rather curious that although many thousands of pounds worth of worked oak is made, and passes through my place every year, none of which is wet stained, so many good people seem to think I am a passing authority upon staining wood. "Old Oak" says he owns a piece of black oak furniture. If this is an accurate description, the colour is not natural, but acquired. The only black oak we have is the bog-oak, found largely in Ireland, and sometimes in this country. A good deal was dug up not long ago near Manchester, and quite recently near Peterborough, quite a submerged forest of oak-trees (the wood as black as night), has been discovered. It must not be concluded, however, that the so-called bog-oak brooches and nick-a-nacks sold as Irish relics, are really oak. As a rule, they are simply carved in sycamore, and other kindred woods, and afterwards ebonised. This can readily be discovered by looking into them closely, when it will be seen, in nine cases out of ten, there is an entire absence of grain or "clash." One does not quite grasp how the black furniture "Old Oak" possesses has grown "whitish" in places, without it is that the light parts are sap! If oak *must* be stained (I am the last man to advocate such treatment), there is no doubt but that toning it down by the fumes of water of ammonia is the most artistic and best way. It is practically almost impossible to tell oak thus coloured from real 15th-century oak. I doubt, however, if the chemical in question does the material any good. It brings on premature old age, for if, after thus staining, the plane or chisel is applied, the stuff seems to cut very dead. It would appear to me that as "Old Oak's" furniture has been already stained, he cannot do better than use for the light parts the ordinary stains advertised, to be procured at any shop that makes a speciality of that sort of thing.—Harry Hems.

* * *

The floors of the new board schools recently erected at Acomb, near York, from designs by Messrs. Demaine and Brierley, of York, have been laid by Mr. Roger L. Lowe, of Farnworth, near Bolton, with his patent redwood block flooring.

Legal.

CONTRACTORS' LIABILITIES.

Under the pressure of competition, it really seems that contractors for large works can be got to undertake almost any liabilities, and to sign contracts rendering themselves responsible for unknown amounts and undefined possibilities. This was lately exemplified once more in the recent case of "Kellett v. City of York" (*Times*, 8 Aug.), which arose out of a contract for the construction of new sewers at York. Besides the usual clauses making the contractor liable for all damage arising to property out of his contract and the like, he also agreed to restore and make good all houses and buildings that might be injured in the course of his work. He was further to take all risk of floods, and of the breaking through of the present sewers into the new work. After the work was done, there were, of course, disputes and an arbitration, and it appeared that during the carrying out of the contract certain houses and buildings had been disturbed and injured. Under the first head of damage there was a claim for injury to the foundations of certain houses, which had made it necessary to pull down and rebuild them. This damage arose from the fact that just beside a shaft which the contractor had sunk in the course of his work there was an old sewer, whose existence was unknown to the contractor and to the engineer and all the other officers of the corporation. While this shaft was open an unusually high flood occurred, which burst and overflowed the old and the new sewer, and washed away the soil, so bringing down the foundations of the houses.

It was argued for the corporation that as under the contract the contractor took all risks of floods, and was bound to make good all damage to buildings, he was liable even for this catastrophe. But a Divisional Court, composed of Mathew and Kennedy, J.J., held that the existence of the old sewer was unknown to all the parties under and at the time of making the contract, and that when the flood occurred it was the bursting of this old and hidden sewer which really caused all the mischief. But the contractor was not liable under this head of damage. He was not an insurer against whatever accidents might happen during or in consequence of the construction of the works. He was, however, held liable for various damages to other houses and their foundations arising from settlements of the soil while making the new sewers and in the course of their construction. It is, of course, possible for a contractor to calculate to some extent the risk he runs in this way; but it is almost impossible for him to provide for the possibilities of damage by the bursting of unknown old sewers along his line of work.

Fred. Wetherfield, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

Preston.—Architect's Authority.—I am obliged by your letter and your suggestions, and will see what can be done at an early date.

* * *

An additional supply of water for Gorebridge district was turned on on Friday, the opening ceremony being performed by Mr. Robert Dundas, of Arniston. The work has been completed at a total cost of about £2,000.

To the Sunday schools in Burlington-road, Ipswich, attached to London-road Baptist Chapel, a new infants' room, class-rooms, kitchen, and Dorcas meeting-room are being added. Messrs. Eade and Johns, of Ipswich, are the architects, and Mr. Catchpole, of Ipswich, has taken the contract. The cost will be over £1,100.

At St. Martin's Vestry-hall, on Tuesday, Mr. Troutbeck held an inquest on John Burns, aged 53 years, a "housebreaker," who was fatally injured on Friday last while he and a number of other men were engaged in pulling down the Duke of Cleveland's mansion at the corner of St. James's-square and King-street. Burns fell from the top of a wall 35ft. high on which he was working, and died in Charing-cross Hospital from a fractured skull and a broken leg. In trying to prize some bricks he overbalanced himself, and in his descent he struck a dormer and then bounded on to a hoarding. The jury returned a verdict of "Accidental Death."

LEGAL INTELLIGENCE.

Building Bylaws.—Important Case at Coventry.—Considerable interest was taken in a case at Coventry on Monday, when George Blakeman, builder, Cope-street, was summoned for infringements of the building bylaws, the court being attended by many persons associated with the trade. The town clerk (Mr. L. Beard) conducted the prosecution, and said the informations (there were three) related to a house defendant had built in Queen's-road. Plans for the house were sent in on July 22, 1893, and were reported upon by the surveyor as not being in accordance with the bylaws, and the General Works Committee of the corporation did not recommend them for adoption. Subsequently the plans were amended, and brought before the committee, who approved of them, and they were then passed by the Council, and the building proceeded with. On August 10, on receiving notice that the house was ready for occupation, the surveyor sent and had it inspected, when it was found that a room had been built which was not shown on the plan as finally approved. The bylaws also required that every habitable room in a domestic building should be at least 9ft. high from floor to ceiling; but this room was not half the height for about half its area. Mr. Masser, for the defendant, said that his point would be that the room was not meant to be inhabited. The town clerk argued that it might be so used, and the corporation would have no control over the tenants of the house in this respect when it had been once approved and inhabited. The room had been built in such a way that there was an obvious temptation to put a bed therein. Mr. Blakeman, when seen on the subject, said the room was only to be used as a box-room; but he (Mr. Beard) submitted that defendant had committed a serious infringement of the bylaws in building this room without showing it on the plan, and in building it an improper height, and without ventilation. Mr. E. J. Purnell, city surveyor, proved the receipt of the plans in question, and of sending defendant notice that the building was not in accordance with them when completed. In examination by Mr. Masser, witness said he did not consider the room fit for habitation. Mr. G. E. Jenkins, assistant surveyor, explained that the room at its highest point was 9ft., and it was 14ft. 3in. long by 12ft. 6in. wide. Mr. Edmund Purnell said he inspected the house, and found a room at the back on the top floor which was not shown on the plan. There was no fireplace in it, but there was an ordinary window. He called defendant's attention to the fact that no ventilation was provided for, and was told it was only a box-room. After a legal argument as to the meaning of the word "habitable" in the bylaw, the magistrate's clerk ruled that it must be left to the Bench to say whether the room was habitable within the meaning of the bylaw. Mr. Masser, in defence, submitted that all the objections raised to the original plan had been met. The room was only intended to be used as a box-room, and assuming that the building was carried out substantially in accordance with the plan, he contended there was no case against his client. No objection, he urged, had been taken against the upper room. As to the room being habitable, his client had made no provision for its being so, and if the owner chose to use it, the duty of the authorities was to give notice calling upon the owner to close it. The Bench, after retiring to consider their decision, said the case was a most important one. They considered all the charges proved, and fined defendant £7 in all, and expenses £1 17s. 6d.

Arbitration at Cardiff.—The dispute which has arisen between the Llangeinor School Board and Messrs. D. C. Jones and Company, contractors, of Gloucester, with reference to the erection of the Tynewydd Board Schools in the Ogmore Valley, has recently formed the subject of a prolonged arbitration, lasting over 20 days. Mr. Robert Richards acted as arbitrator, and the proceedings were conducted at the Park Hotel, Cardiff. The claim was by Messrs. Jones and Company, for about £1,600 for extras and variations, and there was a counterclaim by the board for about £700 for omissions and deductions, but certain items were admitted on both sides. Among the witnesses called on behalf of the claimants were Messrs. J. F. Lambert (former architect to the board), W. McGaul, Bridgend, Mr. Rooney, and Mr. Taylor, of Cardiff, and a number of Gloucester gentlemen; while evidence for the board was given by Alderman Jones, Cardiff; Mr. George Thomas, Cardiff; Mr. P. J. Thomas, Bridgend (present architect to the board); Mr. Jacob Jenkins, and a number of local witnesses. The award will be made early in October.

Arbitration Case from Southampton.—Mr. P. E. Squarey, F.S.I., has sat as umpire at the Surveyors' Institution, London, to determine the value of 26 perches of land, situate at Southampton, compulsorily acquired by the London and South-Western Railway to enlarge the station at Southampton West. A claim was made on behalf of the trustees, under the will of the late Mr. James Whitchurch, the arbitrator for whom was Mr. Alfred Andrew Burnett, F.S.I., 2, High-street, Southampton (of Messrs. Burnett and Son), while Mr. Edward Bance, surveyor, Southampton, acted in a like capacity for the company. The land, it was stated, was freehold, and had a frontage of 162ft. to Blechynden-terrace, and a return frontage of about 60ft. to Blechynden-street, which, however, tapered down to 33ft. Mr. A. A. Burnett, F.S.I., of Southampton, said that his valuation was £1,437 10s. In his view, 15s. per foot, or £8,000 per acre, was a strictly moderate estimate of the value. Mr. William Burrough Hill, F.S.I., of Southampton, stated that he had sold land in the immediate neighbourhood at Blechynden at £10,000, and in Southampton at £35,000 per acre. His estimate of the value of the land came to £1,498 7s. 6d. On behalf of the company, Mr. Edward Bance gave the estimate of value at £495, which worked out at £2,828 per acre. The whole of the land was reclaimed foreshore. Mr. W. H. Mitchell, of Southampton, valued the land at £558 5s. The umpire reserved his award.

CHIPS.

Lieut.-Col. W. H. Hayden, R.E., Executive Engineer, Bombay Public Works Department, has permission to retire from the service, with effect from December 17 next.

At Glasgow Dean of Guild Court on Friday, the University Court were granted authority to erect a two-story building in Queen Margaret-crescent, Kelvinside, to be used as dissecting-rooms and lecture-hall for the medical classes at Queen Margaret College. The extension is estimated to cost £5,000.

The first intermediate school established in Montgomeryshire under the Welsh Intermediate Education Act was opened on Saturday at Llanfair-Caereinion. The building, of corrugated iron, resting on brick supports, was erected by Mr. J. Lee, of Manchester, from his own drawings, as approved by the Charity Commissioners. The cost of the work was £150 only, and the room will accommodate 45.

Colonel Charles Seely, in retiring from the position of Unionist candidate for Lincoln, has offered to defray the cost of a Unionist club in that city, estimated at £8,000.

Mr. George Hutchinson, of Wesley-street, Southport, died on Thursday in last week from the effects of an accident sustained four years ago. Deceased, who was over sixty years of age, had long carried on business as a builder in the borough, and was, indeed, among the first to embark in extensive building enterprise in Southport.

By permission of the Duke of Westminster, the picture galleries at Grosvenor House were visited by 4,542 persons on Sunday afternoon, in connection with the National Sunday League.

The death is announced of the Italian Senator, Signor Ariodante Fabretti, of Turin, a Professor of Archæology, born at Perugia in 1831. He was exiled for his Liberal opinions in 1848, and settled in Turin, where he became director of the Museum of Antiquaries, and Professor of Archæology at the University.

The first of the ninth annual winter course of lectures in connection with the professional examination of the Surveyors' Institution will be delivered by Mr. Philip E. Pilditch, F.S.I., on Tuesday, October 2, at 7 p.m., for Associates; and on Friday, October 5th, at 7 p.m., for Fellows, at 2, Duke-street, Charing Cross.

The place of M. Edmond Guillaume, as architect to the Palaces of the Louvre and the Tuileries, has been filled by the appointment of M. Paul Blondel.

Kingsteignton Potteries Brick and Tile Works, situated about a mile from Newton Abbot, were almost destroyed by fire on Tuesday. The main building, containing several thousand pounds' worth of machinery and partly-manufactured goods, was greatly injured, and the damage done amounts to £40,000 or £50,000. The works belong to Messrs. Hexter, Humpherson, and Co. About 200 hands will, in consequence, be thrown out of employment for several months.

At present Messrs. R. and W. Phillip are engaged in repairing parts of Linlithgow Palace. Some of the lintels forming part of the old towers have been repaired, and at other parts of the building the wall heads have been renewed. A good deal of cement work is also being done for the Secretary of State for Scotland.

The Duke of York public gardens and pleasure grounds at Grimsby were publicly opened on Friday. The pleasure gardens occupy an area of over four acres. The work has been carried out by Mr. A. Walker, of Leeds, at a cost of £2,075. The fencing and gates have been supplied by Messrs. Lockerbie and Wilkinson, of Birmingham, and Mr. H. Marrows, of Grimsby, has built the caretaker's lodge for £392.

WATER SUPPLY AND SANITARY MATTERS.

Ashbourn.—At the last meeting of the Ashbourn Local Board, the Water Supply Committee reported that the sinking of the well on the Derby-road for the Ashbourn Waterworks had made good progress; the depth now reached was 73ft., and the kerb was now resting on the sand rock. The daily yield was 12,000 gallons; but this was not sufficient for the supply of the town, and the work of excavation would have to be continued. The water had been analysed and found to be a harder water than that at Sturston Spring, and quite fit for drinking purposes. The total cost of the well was £341 18s. 9d. Mr. Radford, C.E., Nottingham (the Board's engineer), stated that he had gone through the accounts and settled with the contractors. The committee recommended that the work now to be undertaken should be done by the Board with a clerk of the works to superintend it. A member moved that work be let by contract, and that tenders be invited for the same. A long discussion took place on the subject, and it was ultimately decided that the Board should undertake the work. It was decided to seek powers to borrow an additional £1,000 for the water supply, making a total of £1,800.

Skelton and Brotton Sewage Disposal.—A Local Government Board inquiry was held yesterday at the Local Board Offices, Skelton-in-Cleveland, by Mr. W. J. B. Clerke, M.I.C.E., Engineering Inspector. There was a large attendance, including representatives from the Saltburn Local Board, who some time ago obtained an injunction at the County Court to prevent the Skelton and Brotton Local Board from polluting with sewage from their district the Skelton Beck, which flows through Saltburn. The inquiry was held to obtain the sanction of the Local Government Board to borrow £14,500 for works of sewerage and sewage disposal, which will prevent this pollution. The scheme, which is of a complex and difficult nature, is from the designs of Mr. D. Balfour, M.I.C.E., F.G.S., Newcastle-on-Tyne, and comprised about ten miles of 21in., 18in., 15in., 12in., and 9in. sanitary and iron pipes, with manhole and lamphole shafts, flushing chambers, and iron-pipe valley crossings. The work consists of a combined intercepting scheme for conveying the whole of the sewage from the ten villages comprised in the Board's district to a point at top of the cliffs on the coast called Cranedale Spout, where the high cliffs, 200ft. in height, will be bored and lined with iron pipes, which will be jointed at the bottom with iron pipes having easy bends laid in a heading driven from the beach, and then by means of cast-iron pipes laid in a cutting in the rock, of which the beach is composed, the sewage will be delivered at lowest point of the furthest ebbing tide. The scheme was explained, and other evidence given on behalf of the engineer, after which the inspector visited the whole of the district.

Stamford.—A special meeting of the Stamford Town Council (in committee) was held on Monday to consider a report upon the drainage of Stamford, and the water-supply of the town, prepared by Mr. Robert H. Bicknell, C.E., of London. He reported that the cost of excavation would be somewhat high, owing to the drains having to be laid for the most part in rock. A system of ventilation by means of man-holes, or lamp-holes, is provided, and Mr. Bicknell proposes to construct five arterial mains, which would take in the whole of the storm-water, utilising as far as possible the existing drains for that purpose. He recommended the adoption of the International system of purification at the outfall works. This system provided for the removal of the greater part of the impurities in the sewage by a chemical precipitant—ferozone—and the filtration of the liquid through filter-beds containing polarite. With regard to the water-supply, Mr. Bicknell says there is abundance of water in the neighbourhood, which, however, is at present only partially used. Mr. Bicknell estimates the cost of carrying out his drainage scheme at £30,000; while the estimated cost of the recent scheme by Mr. Lawford was £54,000.

West Hartlepool.—On the 12th inst., Mr. John Bird Clerke, A.M.I.C.E., one of the Local Government Board inspectors, held an inquiry consequent upon the corporation having made application for sanction to borrow £12,000 for technical school, £6,000 for public abattoirs, £3,976 for works of sewerage and footpaths, and £3,000 for the erection of public library. The plans and schemes were explained by the borough engineer, Mr. J. W. Brown, the whole having been prepared by him, except the technical school and lecture hall, which are the work of Mr. H. A. Cheers, of Twickenham.

◆

The late Mrs. Ellen Barton, of Caldy Manor, Cheshire, has left directions in her will that her diamonds shall be sold and the proceeds applied in placing a Paradise window, by Kempe, in the chancel of Bishopstoke Church, as a memorial of her late husband.

Our Office Table.

The annual report on the Irish National Gallery issued by the director, Mr. Walter Armstrong, who has now completed 2½ years of work there, speaks of continued progress. The director cannot afford, with the limited grant at his disposal, to purchase modern pictures, but he has been able to buy during the past year fourteen works including an English landscape by John Constable; a landscape in Wales, by J. D. Harding; Irish landscape, by Bartholomew Colles Watkins; Interior of a Flemish Mansion, by Nicholas Giselear; Farm-house Interior, by D. Teniers; Portrait of an Italian Gentleman, by Andrea Solario; a portrait of a gentleman by an unknown artist of the Dutch School. A Martyrdom of the school of Guadenzio Ferrari, a chalk study by François Boucher, and a pencil drawing by Antonio Moro. The Constable was bought for £125, the Andrea Solario portrait for £552, and the Dutch portrait of a gentleman for one hundred guineas. It will be seen that many schools and masters are represented in the additions just made to this small but interesting collection.

Birmingham does not at first sight appear the most appropriate locale for an exhibition of works by living English marine painters; but the very fact that it is so centrally situated in the heart of England gives its citizens a keen appreciation of the sea, and it is probable that Mr. Whitworth Wallis's endeavour to bring together at the Birmingham Municipal Art Gallery by Monday week, the 1st October, a thoroughly representative collection of modern British seascapes and court scenes will be highly successful. Among the artists whose works will be hung at Birmingham are Sir Oswald Brierley, Messrs. Henry Moore, R.A., J. C. Hook, R.A., John Brett, A.R.A., Colin Hunter, A.R.A., Stanhope Forbes, A.R.A., A. W. Hunt, C. Napier Hemy, Edwin Ellis, Frank Brangwyn, Tom Henry, Tom Graham, Hamilton Macallum, W. L. Wyllie, C. W. Wyllie, H. S. Tuke, David Murray, A.R.A., Edwin Hayes, R.H.A., E. M. Hale, W. H. Bartleet, Albert Goodwin, Walter Langley, R. W. Macbeth, A.R.A., W. Small, Nelson Dawson, J. Fraser, &c. Among the contributors are also the Corporations of Manchester, Liverpool, Maidstone, Leeds, Oldham, Preston, and Sunderland; the Queen, the Prince of Wales, the Duke of Coburg, Sir J. E. Millais, Sir Donald Currie, his Honour Judge Bacon, Colonel Hargreaves, Messrs. J. P. Haseltine, H. Tate, George Macullock, W. S. Caine, S. Pope, Q.C., J. T. Brunner, and others.

A temporary loan collection of pictures has been brought together in the new Technical Schools at Bury, Lancs, opened on Saturday last. The display organised by Messrs. Thomas Agnew and Sons, of Manchester, includes some five hundred pictures. The best portrait is that of Tom Wrigley, by G. F. Watts. The landscapes include "Lake Como," by Clarkson Stanfield, a Nile scene by W. Müller, and works by Old Crome, while among the living masters represented are Williams, Leader, G. Clausen, Anderson Hague, and F. W. Jackson. The Duke of Devonshire lends two pictures by Landseer, "Bolton Abbey in the Olden Time," and "Laying Down the Law," both well known from engravings. Other exhibits of interest are "Swine," by George Morland; Marcus Stone's "Lost Bird," F. W. Shipworth's "Roman Holiday," Heywood Hardy's "Disputed Toll," an elephant at a turnpike gate, and W. L. Wyllie's "Port of London."

So manifest has been the benefit to Richmond and Kingston of the new lock and bridge, and so much has the value of property for at least four miles above that point been improved by the maintenance of a clear and level stream, that a movement is on foot for forming a similar half-tide weir lower down the river, probably at Putney or Wandsworth, and possibly as low as Battersea. Hammersmith has actively taken the initiative in seeking a remedy, and, desiring to associate in the movement all the other parishes interested, organised an investigation from a steamboat of the water-way from Chelsea to Teddington. Over a hundred delegates from the local and vestry authorities took part in a trip up the river on Tuesday. No definite plans or schemes have at present been put forward for adoption or discussion. The parishes more or less affected are Isleworth, Brentford, Wandsworth, Chiswick, Fulham, and Hammersmith on one side of the stream, and Kew, Mortlake, Barnes, Putney, and Wandsworth on the other. At the same time, the construction of the Richmond lock has not been an unmixed benefit, for it is alleged that, owing to the damming-up of the stream, there has been a serious loss of waterway below Richmond, the lessening of the depth varying from 8in. to 12in. at Hammersmith to 15in. at Kew. In self-defence the districts affected are quickened to take action by erecting another weir farther down the stream. A conference of all the bodies interested will shortly be held to ascertain if joint action can be agreed upon.

The eighteenth London course of lectures and demonstrations for sanitary officers will be given this autumn under the auspices of the Sanitary Institute at the Parkes Museum, Margaret-street, Oxford-street, W., on successive Mondays, Wednesdays, and Fridays, at 8 p.m. The first of a series of 24 lectures will be delivered on Wednesday, Oct. 17th, when Mr. J. Castell Evans will give an introductory address on "Elementary Physics," and among the other lecturers are Sir Douglas Galton, who will treat, on Oct. 29, upon "Warming, Ventilation, and Lighting"; Mr. H. Law, who will explain, on Oct. 31st, "Principles of Calculating Areas and the Interpretation of Plans and Sections to Scale"; Mr. Keith D. Young, who will speak, on Nov. 5th, on "Sanitary Building Construction"; Mr. J. Wright Clarke, on Nov. 9th, "Details of Plumbing Work"; Professor Henry Robinson, on Nov. 14, "Sewerage and Sewage Disposal"; and Dr. Louis Parkes, who is to give the last lecture of the series on December 3rd, his topic being "Sanitary Laws and Regulations Governing the Metropolis."

The National Association of Master Builders have been in communication with her Majesty's Office of Works with the object of getting quantities made part of the contract for the building works of that department. Mr. Primrose stated that the Commissioners absolutely declined to do so, but he has promised to make the following recommendations to the Commissioners: That a paragraph should appear in the advertisements in future to the effect that although the Office of Works would not be responsible, yet the measuring surveyors held themselves responsible for the accuracy of the quantities, that the name of the surveyor or surveyors should appear in the advertisement, and that in works of £20,000 and upwards two surveyors should be appointed, one by Her Majesty's Office of Works, and the other by the Institute of Builders.

The fifth annual congress of the district councils of Scotland in connection with the registration of plumbers, under the auspices of the Worshipful Company of Plumbers, took place on Tuesday in the Town Hall, Inverness, Provost Ross presiding. He was supported by Sir Stuart Knill, the master of the Plumbers' Company; Professor Glaister, of Glasgow; Professor Matthew Hay, of Aberdeen; Professor Macadam, of Edinburgh, and others. In his opening address the provost welcomed the congress to the Highland capital, and said he had no doubt the congress would do much to forward sanitation in the north. Sir Stuart Knill, in acknowledging the welcome, said he had always felt a deep interest in the subject of sanitation, especially in regard to plumbers. As master of the Plumbers' Company, he was desired by his fellows in the governing body to attend there to pay respect to the plumbers of Scotland. The object of his visit was also to ascertain for the benefit of his company what were the wishes and proposals of the plumbers of Scotland. Among the resolutions passed at the congress was one pledging those present to do everything to secure the passing of the Plumbers' Registration Bill, and another instructing each district council to endeavour to establish classes in suitable centres for apprentices and journeymen.

The town council of Louth received at the last meeting a report from the sanitary committee stating that the Local Government Board had been urged to take some action towards altering the law with regard to house drainage, in order that the great and unnecessary cost and inconvenience likely to be imposed upon sanitary authorities through the recent decision in the Queen's Bench Division in the case "Travis v. Uttley," might be mitigated. The decision declared combined house drainage, whether in private grounds or under buildings, to be public sewers, and maintained by the sanitary authorities. No action was taken on the matter other than to adopt the report.

The American Institute of Architecture will hold its twenty-eighth annual convention in the rooms of the Architectural league, in New York City, on Monday, Tuesday, and Wednesday, October 15, 16, and 17. The business of importance to be brought before the convention will include the relation of the chapters to the Institute, new proposals as to providing for the admission of all practising members of the chapters to membership in the Institute, and putting the business of the conventions into the hands of delegates from the chapters.

CHIPS.

The memorial stone of the new club-house of the Helensburgh and Gareloch Conservative Association was laid on Saturday. It is situated in Sinclair-street, Helensburgh, within a few minutes' walk of the station, and is being built from designs by Messrs. Honeyman and Keppie, of Glasgow. The building, which is already in progress, is being constructed of red freestone, and is to be two stories in height. The ground floor will be apportioned out in shops, and the first floor is to be divided into reading and recreation rooms, with a hall holding 200 people at the back. The cost is to £3,500.

A committee appointed to advise the Bristol City Council on the question of improved accommodation between Hotwells and Bedminster, have decided in favour of a scheme prepared by the docks engineer for a bridge across the Avon by Clift House, giving a wide roadway and two footpaths, with a 90ft. span, which would allow of two vessels passing easily. The approach on the Gloucestershire side would be by an easy gradient of 1 in 53, while on the Somersetshire side it was proposed to have two approaches, each 42ft. wide. The estimated cost, exclusive of land, would be £34,500.

A special meeting of the Bolton Town Council was held on Wednesday week, to consider the advisability of spending £75,000 in a sewage undertaking, rendered necessary by the Mersey and Irwell joint committee enforcing their powers under the Rivers Pollution Prevention Act. Eventually a large and representative committee was appointed to go thoroughly into the matter, and, if necessary, obtain the best technical advice procurable.

A serious fire occurred on Monday morning on the premises of Mr. W. Warden, sawmills proprietor and timber merchant, of Regent's-row, on the banks of the Regent's Canal at Dalston. The buildings involved comprised the boiler-house and sawmills—a building about 70ft. by 60ft. Six stacks of timber, commanding an area of 100ft. by 40ft. in height, were destroyed, and other stacks were greatly injured, as well as adjoining premises.

Arrangements are being made for the rebuilding of the English church at Grindelwald. The old site near the Bear Hotel will again be used, but the building will be of stone, and will accommodate more worshippers than the church destroyed in the fire of 1892. The cost will reach about £1,600.

Major-General Phipps-Carey, on behalf of the Local Government Board, held an inquiry at Southport Town Hall, on Friday, into the application of the corporation to borrow £2,900 for public recreation grounds. Mr. J. Crabtree, borough surveyor, explained that the expenditure was on account of a greenhouse at Hesketh Park and the laying out of two recreation grounds, one at Crowlands and the other adjacent to the cemetery.

The Newcastle-on-Tyne Finance Committee have unanimously agreed to report to the Council that they recommend the formation of a deep water quay, running from the end of the present one opposite the grain warehouse to be joined on to the deep water quay finished last year, west of the same. The total length of the new quay will be 351ft., and the estimated cost is £24,000. The work is proposed to be carried out by the Corporation under the superintendence of Mr. Laws, who will have the assistance of Mr. Messent, chief engineer of the River Tyne Commissioners.

Memorial stones were laid on Saturday of the new Albany Sunday School in Shaftesbury-avenue, Bristol. The new building will comprise a schoolroom, 45ft. by 30ft., seating 250 adults or 300 children in classes; an infants' school, 20ft. by 15ft., and two classrooms, each about 13ft. square, all with separate entrances. On the right-hand side of the schoolroom are three smaller classrooms, separated from the large room and from each other by revolving partitions. Pitch pine dadoes, open-boarded roofs, and tinted windows are adopted. The architect is Mr. J. H. La Trobe, of Clare-street, Bristol.

Trade News.

WAGES MOVEMENTS.

Bolton.—A general meeting of the members of the Bolton Master Builders' Association was held on Friday. Mr. F. W. Briscoe, the secretary, presented a statement as to the position of the several matters in dispute. As to the plumbing branch, the men had withdrawn entirely their condition as to those who were to be employed in the office by the masters. The only point now in dispute was the fines which the men proposed to inflict upon the employers in the cases where strikes had taken place. The operatives had been told that under no such circumstances would such fines be recognised, especially seeing that the dispute had arisen upon the office question—now conceded by the workpeople. The men's representatives had, however, reaffirmed their decision as to the fines. In reference to the stonemasons' strike, as the men had agreed to the introduction of machinery, and several employers had arranged for having machines put down, there was really very little in dispute. At an interview with the men, the employers agreed to forego their conditions as to the sawn stone rule, and that being so, the matter in dispute was at an end. However, the operatives handed in a letter objecting to the free use of machinery, and wanted to stipulate that where machines were put down they should only be allowed to be worked according to the hours worked by the operatives. The masters could not recognise any such condition, and as the operatives had intimated their adherence to the previous resolution on the point, there was no settlement to report. It was decided to adhere to the position taken up.

Coatbridge, N.B.—The plumbers in this district are out on strike in consequence of the refusal of the masters to sign the Association rules fixing a standard wage for all workmen, irrespective of efficiency. The masters have a pressure of work.

York.—The strike of the operative plumbers of York has been settled. The matters in dispute were submitted to arbitration, and the award grants to the men the increase from 7d. to 7½d. an hour in their wages—the latter being the standard rate—which they had asked for.

DOULTING STONE.
CHARLES TRASK & SONS.
DOULTING, SHEPTON MALLET.
London Agent:

Skinner, E.	3	2	„
Corder and Barnicott (accepted) ...	3	2	„

Gailey-cum-Hatherton, Staffs.—For partly rebuilding and enlarging the National Schools. Messrs. J. R. Veall and Son, Wolverhampton, architects :—

Reynolds, J., Cannock	£277	0	0
Gough, H., Wolverhampton ...	270	0	0
Gilbert, A., Penkridge (accepted) ...	260	10	0

Hanham, Somerset.—For a new pulpit in Bath stone, for the parish church :—

Jones and Willis, London and Birmingham £61 (Accepted).

Heywood, Lancs.—For the supply of iron pipes for sewerage purposes, for the town council :—

Firmstone, C. E., and Brothers (accepted).

Kingsbridge, Devon.—For sewer extension from Waterloo-road to Wallingford, for the local board :—

Lidstone, J.	£100	0	0
Veale, R.	99	9	0
Andrews, G. B. Ivybridge	98	0	0

Launceston.—For the supply of 781 tons of cast-iron water mains, for the town council. Messrs. Jenkins and Son, of Liskeard, engineers :—

Shaw and McInnes, Firhill Works, Springbank, Glasgow (accepted), at £4 10s. per ton for ordinary sizes, and £8 10s. for special castings.

London.—For alterations to No. 123, Cornwall-road, W. Mr. W. Wonnacott, A.R.I.B.A., 106, Lancaster-road, architect :—

Wilkinson, G. W., and Sons ...	£460	0	0
Williams, J. P. (accepted)	419	10	0

London, N.—For alterations to Nos. 192 and 193, Upper-street, Islington, for Mr. W. J. Lewis. Mr. Edmund J. Harrison, 12, Compton-Terrace, Highbury, N., architect :—

Ward and Lamble, Holloway ...	£245	0	0
Gardner and Hazell, Canonbury ...	202	0	0
Milroy, J., Clerkenwell	193	0	0
Houghton, E., and Sons, Stroud Green (accepted)	148	0	0

London.—For alterations, additions, and general repairs to Nos. 593-5-7, Old Kent-road, S.E., for Mr. R. A. Langford. Mr. John Jas. Downes, 11, The Parade, Lewisham High-road, S.E., architect :—

Herring, Peckham	£975	0	0
Lacke, City	896	0	0
Lorden, Tooting	867	0	0
Powditch, King's Cross	830	0	0
Champion, Peckham	705	0	0
Best, S. R., New Cross (accepted)...	689	0	0

Merton, Surrey.—For alterations to Merton National Schools, for the trustees. Mr. H. G. Quartermain, Kingston-road, Merton, architect :—

Bowyer, J. and S. (accepted) ...	£750	0	0

Merton, Surrey.—For the erection of a school of science in Kingston-road, for the trustees of the Rutlish Charity. Mr. H. G. Quartermain, M.S.A., Kingston-road, Merton, architect. Quantities by Mr. W. H. Dearle, 6, John-street, Adelphi, W.C. :—

	A.	B.	C.
Patman and Fotheringham ..	£5,392	£1,781	£7,173
Lawrence, E.	5,048	1,652	6,700
Parsons and Townsend ...	5,039	1,598	6,600
Higgs and Hill	4,874	1,510	6,384
Killby and Gayford	4,757	1,513	6,270
Smith and Son...	4,745	1,496	6,241
Oldridge	4,679	1,548	6,227
Holliday and Greenwood ...	4,647	1,488	6,135

A.—School building. B.—Plumber's shop and lecture hall. C.—Total.

[Two other tenders received late.]

Merton, Surrey.—For alterations and new latrines at Abbey-road infants' school, for the trustees. Mr. H. G. Quartermain, Kingston-road, Merton, architect :—

Parsons and Townsend, Wimbledon (accepted) £435

Milnrow, Lancs.—For fencing in the old mill yard, for the local board. Mr. C. Rothwell, surveyor to the local board :—

Leach, J. (accepted).

Newport, Mon.—For the erection of leading lights, for the harbour commissioners :—

Langmaid (accepted)...	£153	3	2

Rickmansworth.—For the erection of a detached villa residence, for Mrs. T. E. Nobbs. Mr. Edmund J. Harrison, 12, Compton-terrace, Highbury, N., architect :—

Brown and Sons, Harefield... ...	£800	0	0
Holland, J., Rickmansworth ...	799	0	0
Green, J., Northwood (accepted) ...	741	0	0
Eames, Rickmansworth	725	0	0

Stafford.—For carrying out sewerage works in the borough, and also the Backwalls North Section, for the town council :—

Tempest, E., Newchurch, near Manchester £20,326 (Accepted).

Swindon.—For the erection of the Bell and Shoulder of Mutton Inn, Swindon. Mr. W. H. Read, M.S.A., Corn Exchange, Swindon, architect :—

Williams, C.	£1,237	0	0
Wiltshire, G.	1,235	10	0
Barrett, T.	1,228	10	0
Williams, J. (accepted)	1,187	17	0

(All of Swindon.)

AND ENGINEERING JOURNAL.
VOL. LXVII.—No. 2073.

FRIDAY, SEPTEMBER 28, 1894.

THE LONDON BUILDING ACT.

THE London Streets and Buildings Bill, of which we have given our readers some account during the last few months, has at length passed into an Act under the general heading above, and comes into operation on the first day of January next. Since we intend to give our Metropolitan readers a general *résumé* of the main provisions of this Act as it applies to streets and buildings, we may confine our attention here to a general review of the clauses as they have been revised and amended in committee. The Act is, as our readers know, intended to consolidate and amend the enactments relating to streets and buildings in London which are contained in various public and local Acts, numbering in all thirteen, beginning with the Metropolitan Building Acts of 1844 and 1855, and ending with the London County Council (General Powers) Act, 1890, and the London County Council (General Powers) Act, 1893. The various Amendment and Management Acts are too well known to require recapitulation. As we have repeatedly pointed out, the piecemeal legislation during the last 50 years has been too complicated and confusing to allow any practitioner, except the most experienced, to understand the many provisions, some new, others dove-tailed and engrafted upon the old. Many of these provisions are extremely doubtful in their application. With regard to the formation and widening of streets and the construction of buildings, the authorities have been in a hopeless condition of indecision, because the existing Acts have not conferred the powers necessary for carrying into effect certain improvements in those matters.

The new Act is divided into 16 parts. These are: I. Introductory; II. Formation and Widening of Streets; III. Lines of Building Frontage; IV. Naming and Numbering of Streets; V. Open Spaces about Buildings and Height of Buildings; VI. Construction of Buildings; VII. Special and Temporary Buildings and Wooden Structures; VIII. Rights of Building and Adjoining Owners; IX. Dangerous and Neglected Structures; X. Dangerous and Noxious Businesses; XI. Dwelling-Houses on Low-lying Land; XII. Sky-signs; XIII. Superintending Architect and District Surveyors; XIV. Bylaws; XV. Legal Proceedings; XVI. Miscellaneous.

The definitions given in the new Act are more precise and unequivocal than many in the old Act. Thus, we find the definition of "street" has been extended and much altered from the one first drafted in the Bill. It runs:—"The expression 'street' means and includes: Any highway and any road, bridge, lane, mews, footway, square, court, alley, passage, whether a thoroughfare or not, and a part of any such highway, road, bridge, lane, mews, &c." The Draft Bill ran as follows:—"Any street, road, or way, or part of any street, road, or way, formed or laid out for building, or commenced to be formed or laid out for building, and also any way, or any part of any way, widened or altered or adapted for the purposes of a street, or commenced to be widened, altered, or adapted for the purposes of a street." It will thus be seen the amended form is more general and comprehensive in its application, the words "formed or laid out for building" being omitted. The amended form takes in every form of inclosure by building or otherwise, and the words, "whether a thoroughfare or not," makes it clear that the word "street" does not necessarily imply a thoroughfare. Again, "the expression, 'way' includes any public road, way, or footpath, not being a street, and any private road, way, or footpath which it is proposed to convert into a highway, or to form, lay out, or adapt as a street." Comparing these definitions in the Draft Bill and those in the Act together, we find the committee have converted the definition of "way" into that of street, as the clause in the Bill for "way" was, up to a certain point, word for word the same as that now adopted for "street." The definition "roadway" has not been altered. As to the term "centre of the roadway," the sub-clause (*b*) amended reads as follows:—"In relation to any street or way of which the centre of the roadway shall not have been ascertained or defined by the Council or the superintending architect: where the roadway opposite the site of the building in question shall since the 22nd day of July 1878 have been widened; the centre of roadway as existing immediately before the date of such widening; or where it shall not have been so widened, the actual centre of the existing roadway." The superintending architect may define the centre of roadway in the case of a street formed or laid out after the 18th day of August, 1890, and the line so defined is to be deemed the centre, notwithstanding that the actual centre of the roadway may have become altered by reason of widening on one or both sides to an unequal extent.

A very important definition is that of (6) "new building," as upon it turns nearly every question of law as to reconstruction. The Draft Bill definition has been remodelled, though the clause, as finally passed, is less clear, to our minds. The definition, as revised, includes, "any building erected after the commencement of this Act; any building which has been taken down for more than one-half of its cubical extent and re-erected, or commenced to be re-erected, wholly or partially, on the same site after the commencement of this Act; and any space between walls and buildings which is roofed, or commenced to be roofed, after the commencement of this Act." The first drawn-up definition was more exact as regards re-erected buildings. It included the re-erection, wholly or partially, of any building on the same site of which an outer wall is pulled down to or within 10ft. of the surface of the ground, any frame building pulled down as to leave the framework of the ground story, or the re-erection or restoration of any building taken down or destroyed to an extent exceeding one-half of the cubical contents. It also included the conversion of buildings not intended for habitation into dwelling-houses, or the conversion of two or more dwellings into one, and other conversions as that of dwellings into shops. By the amended Act these several conversions of premises are excluded. We think it is a pity they should have been, as many houses are converted into shops and other uses for which they are ill-suited, and become means of avoiding the Act. Other definitions of importance in the new Act are those of "party wall," "topmost story," and "building of the warehouse class." As regards the first, the expression means "(*a*) a wall forming part of a building, and used or constructed to be used for separation of adjoining buildings belonging to different owners, or occupied, or constructed, or adapted to be occupied by different persons; or (*b*) a wall forming part of a building, and standing to a greater extent than the projection of the footings on lands of different owners. This definition would include any projecting mass of masonry or wall. The term "topmost story" has been frequently called into question as to whether it is an attic in the roof, or a story below the roof. The Act says "it means the uppermost story in a building, whether constructed wholly or partly in the roof or not," a definition which is sufficiently obvious to avoid any misapprehension in construing the schedule of the thicknesses of walls. Again, a "building of the warehouse class" is thus interpreted. It means "a warehouse, factory, manufactory, brewery, or distillery, and any other building exceeding in cubical extent 150,000c.ft., which is neither a public building nor a domestic building." As the term "public building" is meant to apply to all buildings used as a place of assembly, or to any structure used, or adapted to be used, for any public purpose; also to those constructed or adapted to be used as an hotel, lodging house, home, refuge, where such building extends to more than 250,000c.ft., or has sleeping accommodation for more than 100 persons, there can be apparently little difficulty experienced in distinguishing a warehouse or building of this class. At present, as we have seen in a recent legal decision, a large building, used partly as a warehouse and partly as a dwelling, gives rise to some difficulty.

Part II. deals with the formation and widening of streets, to which part of the Act we can now only refer briefly. While the new law will not affect the powers of the local authority to widen, alter, or improve any street, certain provisions (sects. 7 and 8) are laid down for this purpose. Sanction must first be obtained by application to the Council before laying out any street for carriage or foot traffic, and the application must be accompanied by plans, sections, and particulars. Erecting a fence, or laying lines of curbing, or levelling the course will be deemed to commence to form a street. The Council may refuse to sanction plans of streets when the proposed street for carriage traffic is not of the full width of 40ft., or such other required width; when the street proposed for foot traffic is not of the width of 20ft.; when the street 60ft. in length or more, of which the length is greater than the width, is proposed without being open at both ends; when any street not within the City is proposed, and will not at, and from, the time of laying out afford direct communication between two streets for carriage traffic, &c. Section 10 requires persons, before commencing to adapt existing streets or ways for carriage traffic or for foot traffic, to make application, and submit plans and sections; it also lays down rules as to what constitutes the commencement of a street; and also as to widening on either side to a less extent than the prescribed distance any part of a street or way. Certain grounds for refusing to sanction adaptation of ways for streets, for traffic or foot, are provided in Section 11, as when the houses on both or one side thereof are not of the required distance of 20ft. between the centre of roadway and the nearest external wall of the houses, or between it and the external fences of the forecourts; or when any such adaptation would result in the formation of a street exceeding 60ft. in length, or a street not exceeding that length, of which the length exceeds the width, not being open at both ends; or resulting in a street not affording direct communication between two streets for carriage traffic. The Council, under Sect. 12, may require, in the public interest, that any street not being within two miles of St. Paul's, which, by reason of its length or importance, is likely to form part of an important line of communication, or, for other reasons, may make it a condition of their sanction that the street or way throughout, or in part, be made of a greater width than 40ft., not exceeding 60ft.,—an important and necessary provision. The next section enacts that no new building, or any part thereof, shall be erected at a less distance than that prescribed from the centre of roadway without consent, and if there be a forecourt, that the said distance be to the external fence. The Council, however, reserve the power in any street of importance to determine a greater distance than 20ft., not exceeding 30ft., from the centre of the roadway. This section is not to apply to any street within two miles of St. Paul's. In case of any dissatisfaction, the person intending to erect or extend such buildings may appeal to the Tribunal of Appeal against the determination of the Council. The other subsections give the conditions under which the Council may give consent to the erection or extension of any building at a less distance than the prescribed, and refer to the re-erection or alteration of any buildings existing at the commencement of the Act, or within seven years previously; also the plans required to show the extent of the building. Sections 14 to 21 deal with the notices, with compensation in certain cases; sanction of Council to new buildings at less than prescribed distances; appeal of applicants on ground of refusal, or conditional grant of sanction, &c. In Part III. the sections relate to the mode of proceeding with regard to buildings beyond line of street, and to buildings projecting beyond general line when taken down. Section 22 provides that no building is to be erected beyond the general line of buildings in any street, place, or row, without the consent of the Council, "in case the distance of such line of buildings from the highway does not exceed 50ft., or within 50ft. of the same, when the distance of the line of buildings therefrom amounts to or exceeds 50ft., notwithstanding there being gardens or vacant spaces between the line of builings and the highway"; such general line shall, if required, be defined by the superintending architect by a certificate. But the section is not to apply to any building erected after the commencement of the Act upon land which either at that date, or within seven years previously, has, or shall have been, occupied by a building. Sect 23 provides that if any building project beyond general line, and is taken down to an extent exceeding one-half of the cubical extent, or shall be destroyed by fire or demolished to the extent aforesaid, the Council may require any new building erected on the site, or any part thereof, to be set back to a line the Council shall direct. Compensation is to be made for damage or expenses which the owner may sustain. Arbitration is provided in cases where the amount claimed exceeds £50. Sects. 24 to 31 relate to notices of definition of general line, appeal against architect's certificate, conditions attached to consent when building in front of line, &c. Part IV., sects. 32 to 38, relate to the draining and numbering of streets.

The very important sections relating to open spaces about buildings and height are given in Part V. Owing to the opposition to the Bill made by property owners, builders, surveyors, the Institute of Architects, and other bodies, the amendments have seriously impaired the efficiency of the original clauses. It will be remembered that section 29 of the Bill required an open space of 40ft. at least (unless the building is less than 40ft. in height) to be left in front of buildings not fronting on a public way, which space was to be clear of all erections except fences or walls. Section 40 of the new Act provides for light and ventilation of habitable basements in the rear of domestic buildings, "an open space of an aggregate extent of not less than 100sq.ft., free from any erection thereon above the level of the adjoining pavement." Section 41 provides also for new domestic buildings abutting on new streets an open space in the rear, exclusively belonging to such building, of an aggregate extent of not less than 150sq.ft. When the basement is lighted and ventilated as above, or when there is no basement story, but when the ground story is not intended for habitation, the open space of this section may be provided above the level of the ceiling of the ground story. The open space in other cases is to be free from any erection above the level of adjoining pavement except a w.c. and receptacle for ashes; it is to extend throughout the entire width of the building, and to a depth in every part of at least 10ft. from such building. Subsection iii. refers to the height of any building in relation to the space required in the rear, and is to be fixed according to a method described. It is briefly this: A horizontal line is to be drawn level with the pavement formed in front of the centre of building, and a diagonal line is to be drawn at an angle of 63½°, meeting the horizontal line where it intersects the rear boundary. No part of such building is to extend above this diagonal line except chimneys, dormers, gables, turrets, and other architectural ornaments, aggregating in all to not more than one-third of the width of the rear elevation. In cases of unlevel pavements, the mean level is to be taken. Other irregularities and exceptional cases are dealt with in several sub-clauses of this section, to which we shall refer more in detail in our next article. The angle at first proposed in the early Draft Bill was 45°, which gave a reasonable, though by no means liberal, space in the rear; that now proposed, 63½°, has been inserted to satisfy owners and others who have vested interests, and we think it is far too great an angle, as it will allow buildings to be erected to a height much in excess of that which all sanitary and hygienic authorities have laid down. We may mention that sect. 47 enacts that a building (not being a church or chapel) shall not be erected or be subsequently increased to a greater height than 80ft., exclusive of two stories in the roof and of ornamental towers, turrets, or other features, without the consent of the Council, except where a contract has been previously made. Discretionary powers are given to the Council, section 49, and the height of buildings in streets of less width than 50ft. is limited to that width in certain cases. A very useful section, too, is 45, which provides for domestic building with courts inclosed on all sides for light or air. It is to the effect that when the depth of such court from eaves or top of parapet to the ceiling of ground story exceeds the length or breadth of such court, adequate provision for the ventilation of such court is to be made and maintained by the owner by means of a communication between the lower end of court and the open air; other provisions relate to windows opening into such courts from habitable rooms, the objects of which are desirable. To these sections and Part VI., on the Construction of Buildings, we shall refer more fully next week.

PROFESSIONAL PARTNERSHIPS.

In a profession which unites so many opposite and conflicting questions as that of architecture, the idea of two or three persons uniting themselves together for a common object appears to be a reasonable one. In most other professions, as those of law and medicine, the partnership idea has always commended itself, for reasons which may not be so easily understood amongst men engaged in an artistic vocation. "An artistic partnership! What next?" many will exclaim. "It is quite an anomaly. As well may we think of partnership in painting or in literature!" A few thoughts may remove this view as regards the architectural profession, which is no longer carried on as an art-craft, as in the old days. It is now something of a combination of the agent, the surveyor, and the artist, and the more nearly these elements are united in one person or brought about by a co-operation of individuals under a proper head, the more of a success it is, and in what way a few considerations will tend to show.

Business negotiations are often best carried on by partners. On the old principle that it is best not to put "all the eggs in the same basket," it is better for the interest of the business that more than one individual should be engaged in its control and management. Clients and patients are like general customers—they go to the shop that suits them the best, and if one member of a firm is not to their liking, the other member may be. Those who have been members of firms know very well this aptness on the part of clients to favour one partner. Lawyers and doctors find it to their advantage in keeping a large business together for one to treat with one class, and the other with another class. Particular clients and patients prefer to see Mr. A. rather than Mr. B., because Mr. A. is more agreeable, more conversational, is more sympathetic—in other words, a "nicer man"—than Mr. B. A firm of solicitors can engage in more than one kind of legal practice, one partner conducting the conveyancing, the other the common law practice; a medical firm has the same opportunity of dividing their patients. And, in a similar way, a varied architectural and surveying practice can be carried on by partners, one of the firm managing the latter class of business, while his partner confines himself to the architectural work. This sub-division is convenient, especially in provincial practices, where A. can confine himself to the designing and the strictly architectural duties, B. to the survey and valuations, and C. to the general business of the office and the consultations. The functions of the business, being thus divided, are more easily discharged; the work is rendered lighter and more congenial to each member, for each individual can take to that branch of the business for which he feels himself more fitted. His attention being confined to it without distraction from ordinary office details and his mind not called away to something of a very different kind, he is able to devote his abilities and experience to more advantage to his client and himself. Those who know what it is to turn their attention all at once from a design involving quiet and sustained study to matters like quantities or valuations, or a question of disputed builder's accounts, will at once appreciate the division of labour. The disturbance is irksome; it is not like an easy transition or pleasing change from one set of faculties to another which is agreeable, but a wrench, when perhaps the mind is in a suitable frame to pursue the work in hand. To go direct from a congenial exercise to one which is distasteful and for which you are quite unprepared is trying to the patience and ruffling to the temper, while it cannot be to the advantage of the work. We can form a general opinion of how a design is likely to be turned out under such circumstances; it goes on by "fits and starts." There is evidence of want of care and thought in the details. Some parts are not thought out at all, but the meaning and intention of the architect or specification has to be guessed, the work is more generally slurred, carried out just as the contractor likes — scamped. During the great ages of architecture, before the traditions of modern professional practice were known, we have good grounds for believing that the real designer was not at all fettered by such matters as quantities, disagreements with builders, and other office-work routine. Such official details and accounts were intrusted to others, as there is evidence to show. There certainly is nothing to indicate that the work of the designer was complicated with duties of the nature of the agent or the accountant. As the operatives formed guilds, so those engaged in the design and supervision of buildings worked upon co-operative lines, each individual contributing his own part to the result. It was a concert of willing heads and hands, rather than the attempt of one man to combine in himself the varied functions of conceiver, agent, and supervisor. The partnership ideal approaches this view nearer than the single professional man ideal. It is possible for two or more individuals of differing tastes and capacities to agree to unite together for their joint benefit; for the artist to join a man of business habits, or a surveyor; or for the architect to join an engineer, a surveyor, or an estate agent. Very often we find the business man, perhaps a surveyor and estate agent by profession, taking a young architect and making a very profitable connection in the three businesses. What is objectionable in these partnerships is the unsuitable alliances often made—perhaps a clever draughtsman with a young and unqualified partner, neither of whom knows anything of building practically; two young men of the same age and qualifications, who both wish to pose as architects or as business men, each anxious to take the lead. There are many partnerships spoilt by this lack of mutual understanding between the members. The firm of Dodge, Buzfuz, and Co. are in many respects admirable business and pushing men; but they each want to be prominent, and the consequence is a constant source of unpleasantness. Each desires to make himself known before the clients, and to have his own way in arranging matters, much to their alarm and perplexity of mind. The merit of a design made by the Co. of the firm—the "ghost," probably an outsider—is claimed by both Mr. Dodge and Mr. Buzfuz, though no one has probably seen either of them at a drawing-board or making a sketch. Petty jealousies and recriminations are continually marring the relations subsisting between the members of this firm, and the friction caused thereby must in the end impair the efficiency of the machine, which cannot work longer with any smoothness. A dissolution of partnership is the inevitable end. Mr. Dodge allies himself with a gentleman of very different tastes, a retiring individual of artistic proclivities, who would rather not be troubled to see a client, if he could sit unmolested and uninterfered with in the sanctum of his drawing office. It is needless to say the two pull harmoniously together. Neither interferes with the other. One takes art, the other the business and the management of clients.

The ill-assorted alliance has much to answer for in slovenliness of design. Each partner has his whims about plan and elevation, and the hapless draughtsman has to include them all. Mr. A. wants a bay window here, Mr. B. a gable there, Mr. C. wants a certain material introduced. As all three want a finger in the pie, we cannot wonder at the partnership design betraying a mixture of discordant features typical of the disunion that exists in the firm. We pity the single-minded artist having to obey so many masters who know nothing of art or the motives which control the architect. From this confusion and want of purpose the single-handed architect is free. He knows his clients' wants, and can form his own judgment without let or hindrance. A single purpose is predominant throughout, and the design partakes of unity in consequence. There are circumstances in which two heads are better than one. In planning, two or three different ideas are of value. It is seldom that a plan of a large and complex building is not improved by the concentration of two or more minds on it. An improved entrance or approach may suggest itself after the first sketch has been drawn out. A little alteration to the boundary walls may enable an important improvement to be made in the interior arrangement. Not so in elevation: one idea is often better than two or three, and the old adage of many cooks spoiling the broth may be taken as a very apt advice.

In our modern system the partnership, a co-operation of distinct talents, appears less objectionable. Separation of duties seems almost inevitable under modern conditions of work. Subdivision of labour in every trade and every manufacture has rendered triumphs of production possible, and has insured more perfect and accurate workmanship. The profession of architecture is in like manner a complex business as well as an art, and a co-operation of distinct talents is necessary. We should probably get better designs and better buildings if both these duties were undertaken by men skilled in design, in planning, and in execution, always supposing that the separate talents were directed in a single-minded way instead of being thwarted by selfish interests. To a very few men it is given to combine the various qualifications necessary to become a successful architect. A few men of individual talent—a Wren, a Sir William Chambers, a Sir Gilbert Scott, and a few now in practice—have achieved a reputation by the natural force of their talents, combined with business qualifications; they have been capable of conceiving as well as practically carrying out their designs. How many more equally talented as artists have failed to make a name? And why? Simply because they have lacked the necessary qualifications of business aptitude and enterprise which men like Scott and Street both possessed. Artists in every true sense of the term as many of these unsuccessful men have been, now and then exhibiting their ability in competitions, they have been wanting in just those qualities which make the whole difference between success and non-success. Had they been united to business and pushing men at the right moment they would have been in the foremost ranks. Fate ordained otherwise. A few of them who still pursue art in some form now and again achieve a temporary victory, and run more successful men "to earth"; others leave the profession, or are engaged as draughtsmen, or as artists. Have we not in these cases a painful illustration of the failure of individual single-handed genius unallied to other qualifications, and do they not point to the failure of individual exertion in a profession which necessitates many other things than art to make it a success—financially, at least?

"OLD MASTERS" ON THE CONTINENT.—IX.

By Charles L. Eastlake

(Keeper and Secretary of the National Gallery).

In a former article which appeared in the Building News on the 8th of June, a brief biographical sketch was given of Fra Angelico, and mention was made of several important works which he executed at Florence. The Accademia di Belle Arti in that city contains some notable examples of his brush, a few of which it is now proposed to describe.

The picture numbered 227 in the official catalogue represents the Virgin enthroned in the niche of a wall hung with drapery of gold brocade enriched with circular diapers. Above this curtain are seen the upper portions of a mural arcade, of which the tympana are filled with rude representations of marble. On either side of the Virgin are depicted three saints—viz., St. Francis and two others on the right, with St. Stephen and two others on the left. All these figures are about 3ft. 6in. high. Their features are delicate, and distinguished by great refinement of expression, and though the flesh tints have flown here and there, revealing the green underpainting then employed, the draperies retain their beauty of colour, and include a chromatic scheme in which pale blue, lilac, Venetian red, and rose pink are associated and harmonised with exquisite skill.

Nos. 235, 236, and 237 are three groups of panels, of which the first two are divided into three, and the last into six pictures, representing incidents in the life of our Lord. Among them we find the Nativity, the Presentation in the Temple, the Circumcision, the Flight into Egypt, Christ Preaching to the Doctors, the Last Supper, the Agony in the Garden, the Mocking of Christ, the Betrayal by Judas, &c. These figures are about 8in. high. They are painted in those pure, delicate colours which distinguish the painter's work. The facial shadows are slight; the features, though rudely modelled, are full of character; but the draperies, as usual, are textureless.

The work numbered 243 contains six little panels, each about 7½in. by 8½in., representing scenes from the lives of SS. Cosmo and Damian, probably part of the same series of which several are in the Old Pinakothek at Munich, and of which one has found its way to the National Gallery at Dublin. They are precious little works executed with great delicacy and even dramatic power. We see the holy men miraculously escaping from fire, shot at with arrows rendered harmless by reversed barbs, and stones which recoil on the assailants. In one scene is a judicial trial; in another a decollation. In a third the saints are thrown into the sea. Vivid colours, careful drawing, and a dexterous rendering of expression will be noticed as characteristic of these pictures.

Nos. 252, 253, and 254 are also by Fra Angelico. The first is divided into five, and the second into six panels, about 15in. square, and all representing incidents in the life of Christ. In 252 we find the Raising of Lazarus, the Entry into Jerusalem, the Marriage Feast at Cana, the Last Supper, the Betrayal of Christ, and the Judgment of Pilate. The principal figures are about 8in. high. Great attention has been given to the perspective and drawing of architectural backgrounds, but the landscape is of a conventional type. The draperies are painted in blue of two shades, maize yellow, pale green, toned crimson, rose pink, violet grey, and lilac. Some of the heads are carefully modelled, but though the features vary in expression, we find throughout a somewhat mannered treatment of the human eye. The iris is raised high on the cornea, and half-covered by the upper eyelid. Another peculiarity is that nearly all the figures have fair or auburn hair.

In 253 the five compartments represent the Procession to Calvary, the Stripping of Christ's Garments, the Release of Souls from Limbo, the Holy Women at the Sepulchre; while a long panel is devoted to the Last Judgment. The handling of these subjects is marked by great skill of composition and vitality of action. This is especially noticeable in the Procession to Calvary.

No. 254 is divided into six panels, on which are respectively painted the Crucifixion, the Entombment, the Ascension, the Feast of Pentecost, and the Coronation of the Blessed Virgin; the sixth panel being occupied by *cartellini* and scrolls inscribed with texts from the Old and New Testaments.

In the scene where the Virgin and the Disciples await the descent of the Holy Spirit, the only indication of that event would seem to be the animated conversation of certain persons in the foreground, who appear to be Gentiles. Madonna and her companions sit apart in a gallery at the rear of the scene. The Holy Spirit does not descend in the form of a Dove, but a small red tongue of flame appears on the nimbus of the Virgin and each of the Disciples. The Entombment in this series is a most pathetic and beautiful scene, and the grouping of the figures who take part in it is admirably managed.

No. 266, entitled "The Last Judgment," is an altar-piece of peculiar shape, oblong in general form, but with a shaped top resembling a large trefoil. In the centre of this head, Our Lord, clad in a pale rose-coloured robe, sits surrounded by a vesica-shaped glory and attended by seraphim. On the outer portion of the glory gold-winged and gaily-robed angels exult, or play on musical instruments. Madonna sits on the right hand of Christ, and St. John the Baptist on His left. Beyond them on either side Saints, Martyrs, Patriarchs, and ecclesiastical dignitaries sit, attired in rich apparel or in the robes of their Orders. The position of their heads is carefully varied. Some are represented in full face, some half-turned aside, others in pure profile; but each is surrounded by a gold nimbus. Most of the heavenly host bear open volumes, and with some are associated the emblems of their earthly martyrdom.

The lower portion of the picture is divided into two subjects by a long paved terrace, in which there are a series of square grave holes. This feature, though unattractive in itself, helps by its correct perspective to give distance and apparent reality to the scenes on either side. On the right hand, demons are seen driving the Accursed into Hell. Among the latter may be noticed a bishop and a friar. Hands are clasped or wrung in agony. Hideous monsters, armed with pitchforks, pincers, and other instruments of torture, do their dreadful work. The place of final torment is divided by horizontal floors of rock into five stages. Here the lost ones are seen hung head downwards, bleeding, maimed, or devoured by a Satanic crew, while others are feasted on scorpions, drowned, or boiled alive.

It is pleasant to turn from this truly gruesome spectacle to the left of the composition, where we recognise the reward of the Blessed. The "Dance of Angels," which has been selected for illustration with this article, gives a pleasant picture of Heaven. Its saintly denizens, crowned with chaplets of red and white roses, join hand-in-hand, and decorously trip before an attractive landscape. Some of them, leaving their companions, hasten to welcome the Elect, including certain favoured saints and friars, while popes, cardinals, bishops, priests, and nuns await a similar greeting. These figures are ingeniously posed on a slope of ground, which gives us what in a pictorial sense may be called a bird's-eye view of the crowd. All are in attitudes of reverence or pious exultation. The robes in which they are clad are for the most part of brilliant hue, and add greatly to the chromatic charm of the work. The entire altar-piece measures about 2ft. high by 6ft. 9in. wide.

* * *

THEATRES.—XLII.

By Ernest A. E. Woodrow, A.R.I.B.A.

The greatest risk and danger from fire in a theatre is acknowledged on all hands to arise from the stage-lighting. This danger, however, as time has gone on has grown less and less, till we wonder, when we look upon a stage illuminated by the electric light, how the theatres of a hundred years ago or less existed even for a short period when the stages were lit "with wax candles on brass censers or cressets." There may be some doubt whether the introduction of gas, as at first used, minimised the elements of danger, for with imperfect burners, and rows of naked and unguarded lights, the stage stood in nightly and momentary danger of becoming ignited. Many of the older hands still to be found within the precincts of the theatres of to-day will tell of the time when it was quite the exception, and not the rule, to see the gas-burners upon the stage protected with wire guards, and as every cloth or piece of scenery was moved it came within dangerous proximity, or even touched the flames of the gas above, at the side, or upon the floor of the stage. Gas "lengths" were hung upon the backs of scenes built up of wood and canvas, with no iron shield intervening, and so close as to make the canvas hot.

The advancement made in the arrangements of the gas-fittings upon the stage have, fortunately for the theatre goer of this decade, rendered such a state of affairs well nigh impossible. It would be idle, however, to argue that the use of gas is no longer a source of danger; but it is only just to say that, with every proper precaution, gas may be used with a certain degree of security.

The Committee of the Franklin Institute which reported upon the "Prevention of Fires in Theatres" in the year 1883, mentioned the fact that the greatest number of fires are caused, as I have said, by the paraphernalia of illumination. The danger of coal-oil, which, as they pointed out, was then much used in Philadelphia and the Western theatres, is self-evident as an illuminating agent; but the hazards of gas, which but within a few years was the safest material at our command, are not so well understood. Besides the dangers of leakage and explosions, we have, in the case of gas illumination, hundreds of flames spread throughout the building, each forming a dangerous sphere around itself. Although, the committee stated, these dangers can, and should, be lessened by proper precautions, such as wire baskets and shields over the flames; still, when we consider the close proximity of the border-lights to combustible gauzes and canvas, and powder, on the hazards of temporary illuminating effects, where jets are fed through rubber hose which must be removed during the change of the scenes, we must ask, Is there not some other method of illuminating by which equally good artistic effects may be produced, and which will at the same time lessen or entirely do away with the hazards of the present system? The experience of the past few years has amply answered this question.

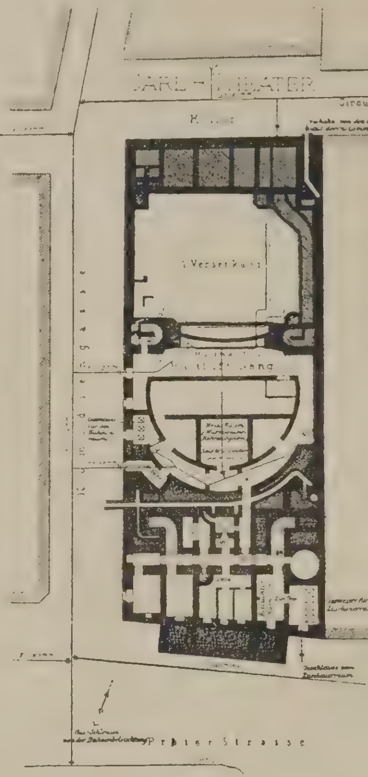

Fig. 1.

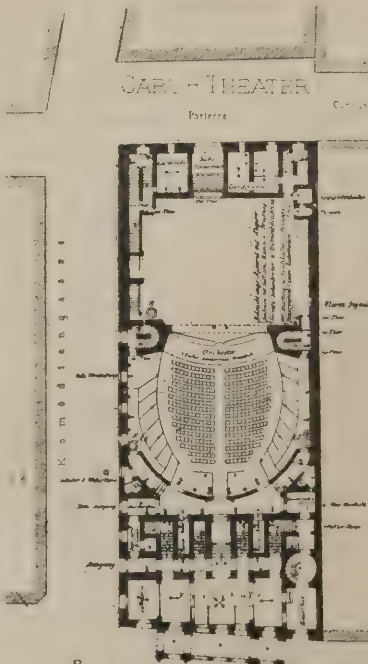

Fig. 2.

I may here mention that the Prussian regulations (paragraph No. 25) prohibits the use of gas and oil for lighting purposes of any sort, and only allows the electric light to be employed.

The disadvantages of gas are enumerated by the Franklin Committee as (1) the dangers from leakage and explosion, (2) the oppressive heat of the number of gas-flames, which dries up the woodwork, canvas, and rope like tinder; (3) the fading of metallic colours caused by the products of gas-combustion; (4) the very expensive process of ventilation needed caused by the fact that the gas in a theatre consumes more oxygen than the audience, which produces the "closeness" of theatres; and (5) the fire-hazard from contact with the light.

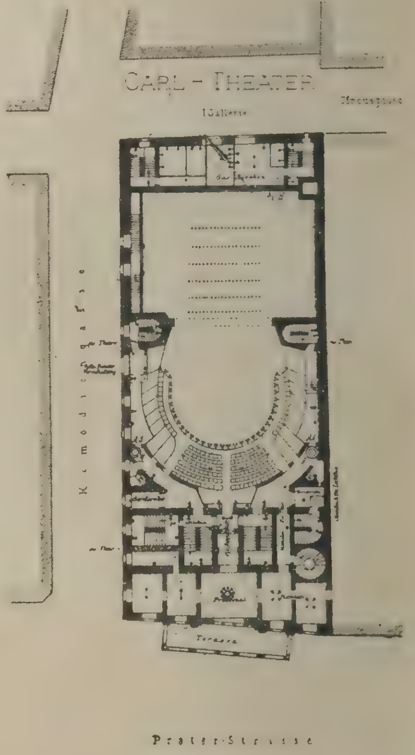

Fig. 3.

Such, then, may be considered the chief objections to the use of gas; and although many of them cannot be overcome, yet we must now consider, if it is to be used, how best it can be used so as to reduce the risk.

The introduction of the electric light upon our stage, by Mr. D'Oyly Carte at the Savoy Theatre in 1881, accomplished two very important steps (the most important of which we shall have to consider hereafter)—*i.e.*, the doing away with gas altogether, and giving an impetus to the gas-fitting trade to improve their arrangements, and make the use of gas less dangerous, as they saw a deadly rival in the electric light ready to cut the throat of their trade as far as stage illumination was concerned. There is no doubt that Mr. D'Oyly Carte then struck the death-blow to the use of gas on the stage; and it is only the prompt action of the large firms of gas-fitters that has put off for a time the day when we shall no longer use gas as the chief illuminant in our playhouses.

Although the electric light has become the accepted medium for all the stage-lighting of the future, yet the time is not yet ripe to do away with gas entirely; and as there are, and will for a time continue to be, theatres old and new using gas, I am compelled to consider the arrangements of the system in connection with these articles.

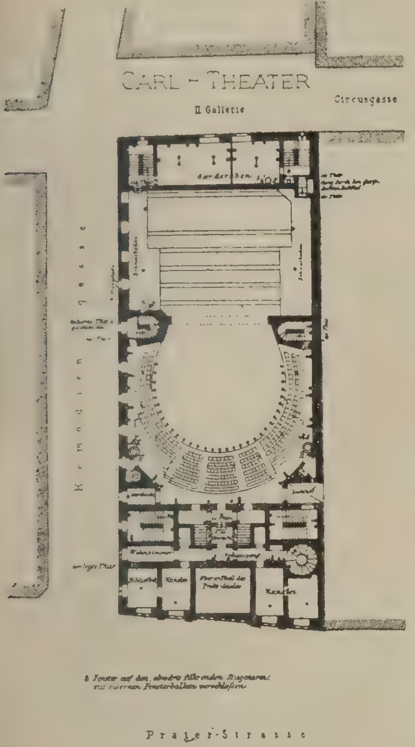

Fig. 4.

Outside the theatre, in a place accessible to the fire brigade, there should be a stopcock on the company's main to cut off the gas in a theatre should a fire occur and prevent the escape of gas feeding the flames; but the use of this stopcock should be very judiciously exercised, for to turn off the gas while the audience are in the building, on the first alarm or outbreak of fire, would be one of the most insane pieces of folly man could be guilty of; for it would place the people in darkness, and cause the most dreadful and deadly panic. It is when a pipe bursts or is fractured by the fall of a part of the building, and a large escape occurs, that the presence of gas is so very dangerous in a fire, and I may here say at once that no soft metal or rubber piping should be allowed in any part whatever of a theatre under any circumstances, hard metal piping alone being admissible.

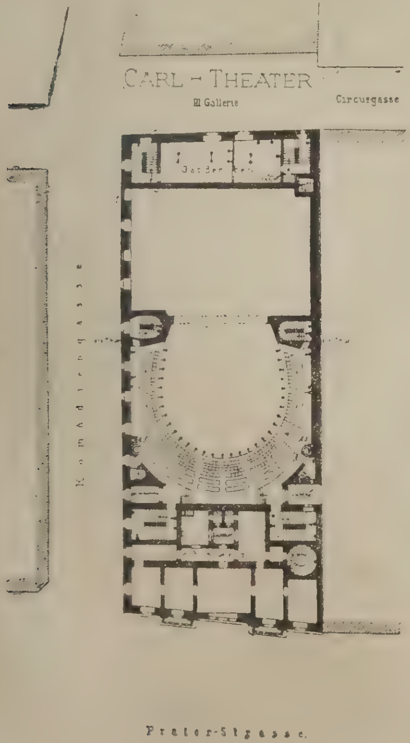

Fig. 5.

It is as well that the gas system in a theatre should be divided up into as many sections of supply as possible, with a separate connection with the street main and different meters. Indeed, it is well, if such a thing can be done, to obtain the supply off two separate street mains, so that should anything happen to one, causing the lights to go out, the other would continue to supply one half the burners, and this can easily be done where a theatre is built on an isolated site, or is situated in two or more streets. Each section of the house should be supplied with a dual service, and again, each division of the house should have its separate meter and supply duplicated. We have already seen how a theatre naturally lends itself to division and subdivision, and it is these lines that must govern the architect when arranging the gas system in a theatre.

The regulations of the London County Council which deal with the gas supply specify that separate and distinct gas services and meters shall be provided to (*a*) the stage, (*b*) the auditorium, (*c*) the staircases, corridors, and exits. For the purpose of this article, however, I would suggest a further division of the building, and add a separate service for the dressing-rooms—one for the refreshment-rooms, foyers, and saloons; one for the workshops, one for the corridors, and one for the staircases; in fact, the more independent means of supply the better.

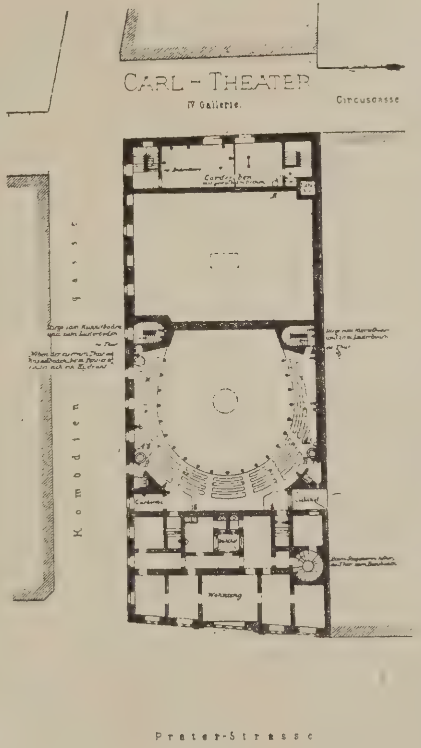

Fig. 6.

I would here say that it is strongly advisable to keep a plan in the offices of the theatre, showing the course of every gas-pipe and the position of every gas-point. Such, indeed, is the practice abroad; and, to show how effectually this is carried out, I produce here the plans of each level of the Carl Theatre, where the round dots indicate the position of each gas-point throughout the building. The basement plan shows the arrangements of the two gas-meter chambers, the one for the stage, the other for the front part of the house; the stage plan gives the position and number of the hanging button lights used to light up the scenes from above.

One of the first points to consider is the location of the gas-meters. These should be placed in a chamber or chambers built of fireproof materials with fire-proof floors and ceilings, with one opening leading thereto, closed by a self-closing iron or other fireproof door, hung in an iron frame, with a three-inch flap, such frame being built into the brickwork. The St. Petersburg regulations suggest an underground vault as the best place wherein to place the gas-meters; but, wherever they are located, the chamber must have most thorough ventilation and through draught, to carry off the effects of any escape and prevent the accumulation of the gas. To hermetically seal the chamber would add so greatly to the danger of explosion, that it would be far better not to place the meter in a chamber at all. Free circulation of air must, therefore, be provided at all costs.

The position of the meter-chamber should be one of ready access for the gasman, and, as his station is on the prompt side of the stage at the gas-indicating plate, where all the stopcocks are, this should be borne in mind; so that should anything occur to take him into the meter-chamber during the performance, he would not be as long traversing the distance as if the chamber were placed in an out-of-the-way corner of the building.

I propose in my next article to deal with gas-fittings and arrangements as suitable to theatres.

AN EXHIBITION OF ARCHITECTURAL PHOTOGRAPHS.

THIS week a collection of photographs has been opened at the Royal Architectural Museum, Tufton-street, Dean's-yard, S.W., which will well repay a visit by those who are interested in topographical views of historic buildings having artistic merit. The gathering has been made with a view to the illustration of this year's excursion of the Architectural Association to Wells and the neighbouring country in Somersetshire, including as well the valley of the Wye. All these photographs are the work of the hon. photographer to the A.A., Mr. John L. Robinson, R.H.A., of Dublin, and each of the large pictures is mounted on a separate card, thereby showing them off to better advantage than in former years, when groups of the prints were shown attached to big sheets of millboard. We may here briefly refer to some of the more conspicuous prints, and at an early date we hope to reproduce a choice which we have made, by way of showing the interest and excellence of the pictures, particularly as exhibiting architectural detail. Photographs, of course, can never exceed good drawings in this respect—no true artist would ever claim so much for them; but, on the other hand, everyone must acknowledge the varied and practical utility of the camera in furthering architectural study, and few architects have done more to insure this advantage than Mr. Robinson. His views of the Cathedral at Wells display the building from several of the best points, and include details of the famous north porch, the chantries of Dean Sugars and Bishop Bubwith, the "Chain Gateway," and the Vicar's Close. St. Cuthbert's Church, too, is well shown, and "The Swan," the headquarters of the party, is seen, with a group before the hostelry. Croscombe Church, both inside as well as out, makes a capital series, and the 15th-century inn up the village street, seen over the stream, should be noted. Nos. 15 and 16 of the screen-work and pulpit in the church leave nothing to be desired; both are first-rate.

Chewton Mendip, Leigh-upon-Mendip, and Evercreech towers are all of the highest order of merit, and well known, of course, for their design and typical character, though the second church is less familiar. Its short and narrow little nave, with its rich parapet of pierced traceries, gives a quaint and uncommon proportion to the composition. Shepton Mallet is done good justice to, and so is Mells, one of the views being almost identical to the sketch which we gave in illustration of the Manor House in the Building News for August 10th, when we commenced our set of plates and notes descriptive of the excursion. Mr. Robinson's view of the porch at Mells is one of the best of his series. Longleat furnishes two good studies, and two more come from Stourhead. Pilton and Bruton Churches, especially the latter, are of much interest; while No. 34, giving a view of the tower as seen over some gabled and ramshackle tiled roofs, furnishes an exceedingly pretty picture, which, rendered in water colours, would indeed look charming. It is a pity that none of the photographs illustrate any of the wrought-iron signs which figure so conspicuously in Bruton village streets. Stoke St. Michael has a good inn with a sign of the same character (No. 61). Frome, with its *via crucis*, is not overlooked, and Pilton village brook, with the parish church on the hill in the distance (No. 74), shows what an artistic manipulation of the camera can do in the way of picture-making with a really picturesque subject. Hormisham (No. 72) exhibits the party at rest after luncheon. Hereford Cathedral and Chepstow Castle and church follow on, and then, further up the Wye, Tintern Abbey figures with admirable grace in several studies, concluding with the arcaded market house at Ross. The exhibition will remain open for a week or two free to the public.

COUNTY LUNATIC ASYLUMS.—III.

By George H. Bibby, F.R.I.B.A.

The administrative buildings of an asylum may be divided thus:—

I. The Board-Room and Offices.
II. The Dining-Hall and Kitchens, &c.
III. The Stores Department.
IV. The Laundries, Bath-houses, &c.
V. The Engineering Department.
VI. The Patients' Workshops (Farm Buildings, &c).
VII. The Mortuary, Post-mortem, and Pathological Rooms, &c.
VIII. Church, Library, Billiard, Lecture, and Club Rooms, &c.

(As the above portions of the buildings should usually occupy a *central* position on the site, I propose to describe the arrangements for these first, and to deal with all the various buildings for the patients later.)

THE BOARD-ROOM AND OFFICES.

The board or committee-room should, as a rule, be placed near the chief entrance to the asylum (*vide* B, Fig. 1); the dimensions, of course, depend upon the numbers of the committee and visitors. A convenient arrangement is to place a waiting-room and the asylum clerk's room *en suite* (*vide* D E F, Fig. 2), with two doors in the board-room. Near to these may be the medical superintendent's business room, any additional clerks' rooms that the size of the asylum may require, a room for the hall porter (*vide* H, Fig. 2), and separate lavatory and w.c. accommodation for the committee and visitors (*vide* L, Fig. 2); a strong-room (or, at least, a large safe) should be provided in the asylum clerk's room.

The area of the visiting-rooms (*vide* V V, Fig. 1) for patients' friends must be proportioned to the size of the asylum, and in large asylums there should be two rooms for this purpose, for males and females, each with two entrances where practicable. These visiting-rooms may be either a portion of the board-room block or of the dining-room department; but in either case it might sometimes be well to so plan them that they may be used as ante-rooms, &c., in connection with the dining and entertainment hall.

It is occasionally convenient to place *within the board-room block* the private sitting and bedrooms of the assistant medical officers (*vide* both Figs. 1 and 2), and other male officials of a higher grade, and upon one floor above similar apartments for the matron, assistant matron, head nurse, &c., in each case providing the necessary w.c., bath, and lavatory accommodation. The board-room block is also occasionally a suitable position for the dispensary (*vide* K, Fig. 2) and drug store, and sometimes for the library, or libraries, and the chaplain's room.

The medical superintendent's house may be near to the board-room block *when* both occupy, as they should, a central position with regard to the patients' buildings for males and females respectively, and it should be arranged that the roads leading to the portions now being described should not be very near to the patients' buildings or airing-courts, for these approaches would often be used by the patients' friends and the public generally, who might annoy, or be annoyed by, the patients, or open up communications with each other contrary to discipline, &c. Some patients try to give the attendants all the annoyance and work they can, and bring absolutely unfounded charges of bad treatment against them, thus distressing their visiting relatives and friends, and creating at the same time ill-feeling against the officials of the asylum.

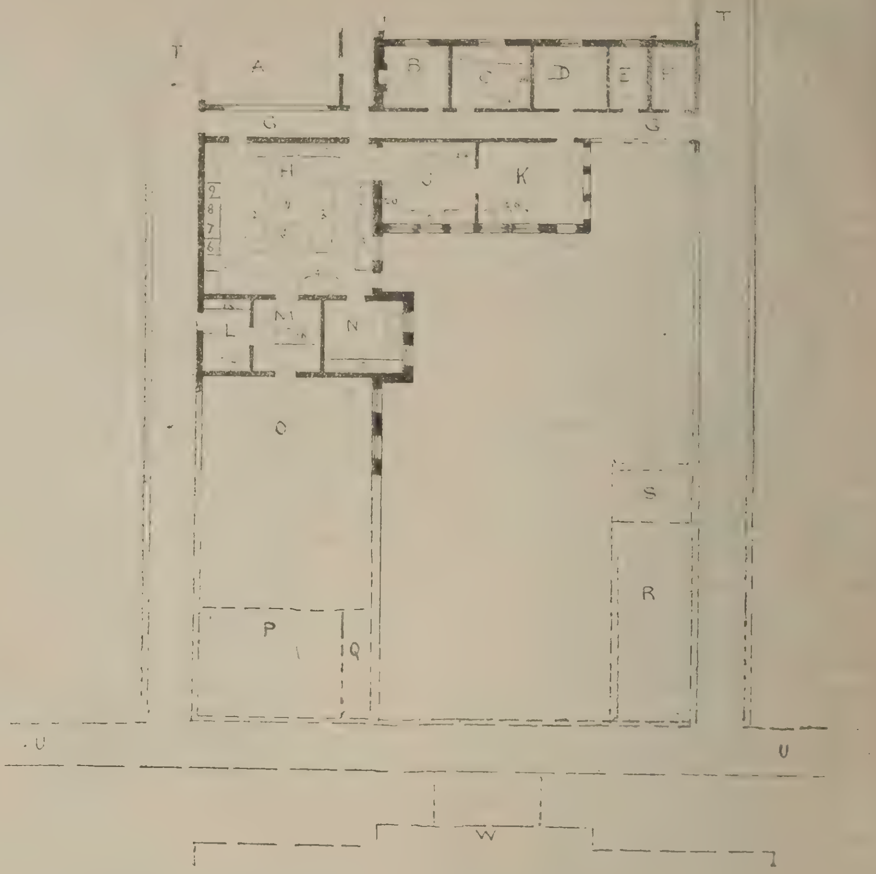

Fig 3. Scale

The Commissioners in Lunacy suggest that, generally, the approach and public entrance to the asylum should be from the north side, as shown in Fig. 1, and the principal entrance, the porter's room, the reception and visitors' rooms, the committee or board-room, the clerks' and other offices, &c., would then be on the north side of the building; but it is frequently placed on the centre of the south front, as in Fig. 2, and there is much to be said in favour of the latter position, which has been adopted by leading asylum architects in recent planning. In Fig. 1, the medical superintendent's house is placed purposely near to the wards for the sick and infirm.

THE DINING-HALL AND KITCHENS.

The dining-hall is usually the largest and most important room in the asylum (*vide* R, Fig. 1), being often used also as a theatre, concert, and entertainment room, as shown also in Fig. 2. It is in this room that great opportunities for watching the patients exist, and it should be cheerful, comfortable, and well lighted. Each nurse should have charge of a fixed number of patients—or say of one table—thus having the opportunity of becoming familiar with their peculiarities and conduct. The arrangement of the tables and seats is one for the architect to consider, and with due regard to the position of the serving-rooms and kitchens, for food should be served to the patients as quickly as possible, so that it may not become cold.

As a rule, the theatricals and concerts, &c., are left to the staff, only a few patients being capable of assisting; but medical authorities endeavour to draw the latter in as far as possible, getting them to sing, recite, or play, &c., the entertainments being regarded as curative agents. An eminent authority wrote:—"Let us by all means try to give the patients something to think about; to occupy their minds to the exclusion of their individual worries. If only for a couple of hours in an evening we can make them forget that they are confined within the walls of an asylum, our time and trouble will not have been thrown away."

The stage (*vide* Fig. 2), with dressing-rooms, closets, &c., need not be raised more than 2ft. 6in. to 3ft. (at the footlights) above the general floor level, with the view partly of preventing danger to the patients through falling over. There should be a fireproof curtain and all the usual precautions in the event of fire; but with regard to this branch of the subject, the able series of papers by Mr. E. A. E. Woodrow upon "Theatres," that recently appeared in the columns of the Building News, give full information.

Between the dining-hall and the kitchen there should be planned a serving-room (*vide* Q, Fig. 1) and washing-up room, each with doors leading both to the kitchen and dining-hall, with the usual fittings, and water services, &c. (see also Fig. 2).

The doorways leading to both kitchens and dining-hall should be so arranged that the sexes shall have separate approaches.

The asylum kitchen (*vide* O, Fig. 1) for large institutions should be 18ft. or 20ft. in height, with top lantern lights and louvred ventilators for taking away steam, heat, and odours of cooking. The floor area should be so arranged that there may be sufficient room around and about the fittings and ranges, &c. (*vide* Fig. 3). There should be an ample supply of slate shelving, dressers, potato bins and washers, vegetable boilers, vegetable steaming chests, vegetable washers, boiling pans, gas roasting ovens, hot-plates, tables, tea apparatus, hot closets and carving-tables, warrenisers, and all the modern appliances for cooking for a large number of persons. Some of these may be placed in the vegetable scullery, which should generally be a separate apartment, and an addition to a large scullery for cleansing purposes fitted with hot water.

In many asylums the cooking is done by steam and gas apparatus; but a roasting coal-range should also be provided.

The kitchen offices (*vide* N, N, N, Fig. 1) should include a small room for the cook (*vide* B, Fig. 3), pantries, larders, fresh meat store, dairy, and living-rooms for the servants' use, also lavatory and w.c. accommodation. The servants' bedrooms might either be upon an upper floor of the kitchen block, or be arranged amongst or near to those for the nurses or attendants. A few patients are in some asylums specially associated with the kitchen department, and may occupy bedrooms or a dormitory near to those occupied by the servants.

THE STORES DEPARTMENT.

The stores required for large asylums are very considerable, and the areas and cubical spaces required for this department are probably much more extensive than the majority of architects, who have not carried out such works, might anticipate. A portion of the provisions is procured by the labour of the patients from the gardens and fields attached to the asylum, and in the workshops much of the clothing, bedding, and other material is manufactured. For all this, and for the raw materials, suitable storage-rooms must be provided in a central position, the approaches thereto being arranged as far as possible with the view of avoiding intrusion with the airing-courts and wards for patients.

The arrangement of the various receptacles for all stores should facilitate the immediate delivery of everything required, and with full attention as to requisite moisture or dryness, heat or cold, and other conditions.

In some asylums the general store-room (*vide* M, Fig. 1) is provided with a gallery on all sides, and a lantern light in the roof serving for the whole; the advantage of this arrangement is that there is a sufficiency of wall space for shelves, hanging boards, chests, or other receptacles which would occupy the wall space otherwise taken by windows.

On the ground floor a fair amount of counter space must be provided, and the approaches to the points where the stores are served out should be so arranged that the sexes shall be separated.

The storekeepers must have sufficient space also for the reception, delivery, and weighing-out of the stores. If the coal stores are placed near to the general store-room, there should be a weigh-bridge with a capacity up to about eight or ten tons, according to the size of the asylum, or its distance from the sources of supply. Some asylums keep steam and house coal sufficient for some months' consumption, a necessary precaution in districts remote from collieries.

The following particulars of leading asylum stores afford a fair idea of the great amount of space to be provided by the architect for storage purposes alone. These were consumed during one year in an asylum that contained a population of 2,139 persons, of whom 253 were officers and servants:—Beef and mutton, 264,695lb.; preserved meat, 23,387lb.; extract of beef, 1,015lb.; pork, 28,347lb.; bacon, 23,738lb.; fish, 65,518lb.; bread, 815,663lb.; butter, 44,942lb.; cheese, 17,191lb.; coffee, 5,639lb.; cocoa, 7,679lb.; eggs, 137,363; flour, 2,276 sacks; milk, 102,968gal.; condensed milk, 2,377lb.; oatmeal, 20,091lb.; potatoes, 7,731 bushels; other vegetables, 13,977 bushels; peas, 2,152lb.; rice, 4,499lb.; sugar, 68,810lb.; tea, 12,336lb.; treacle, 1,402lb.; arrowroot, 3,289lb.; sago, 564lb.; currants, 6,460lb.; raisins, 996lb.; mustard, 754lb.; pepper, 518lb.; salt, 143cwt.; vinegar, 358gal.; barley, 1,376lb.; jam, 17,019lb.; tapioca, 300lb.; lemons, 9,083; oranges, 7,780; lemonade, 300 bottles; caraway seeds, 539lb.; pickles, 412gal. Heating, &c.: house coals, 966 tons; steam coals, 1,297 tons; firewood (faggots), 17 loads. Lighting, &c.: gas coals, 1,545 tons; lime, 18 tons; sperm oil, 108gal.; paraffin oil, 23gal.; candles, 347lb.; tapers, 112lb.; matches, 924 boxes. Washing, cleansing, &c.: soap, 39,334lb.; soft soap, 9,744lb.; soda, 29,914lb.; starch, 1,232lb.; blue, 396lb.; brooms—bass, 325; do. birch, 612; do. hair, 408; brushes—banister, 66; do. hair, 206; do. laundry, 37; do. scrubbing, 1,190; do. shoe, 119; do. stove, 154; do. tooth, 204; combs—long, 1,080; do. tooth, 898; do. back, 72; black lead, 255lb.; Bath bricks, 541; emery cloth, 290 sheets; hearthstones, 5,548; whiting, 1,008lb.; sand, 600 bushels; chloride of lime, 1,032lb.; beeswax, 80lb.; neatsfoot oil, 14gal.; pails, 70; door mats, 57; dust skips, 62; house flannel, 4,169 yards; wash leathers, 189; broom handles, 98; squeegees, 44. Tobacco and snuff: tobacco, 3,823lb.; snuff, 143lb.; tobacco pipes, 73 gross, &c.

In addition to these, storage must be provided for clothing, bedding, &c., for the use of officers and patients, as well as for saleable goods, &c., manufactured on the premises. Also for the storage of material usable in the repair of the asylum buildings under the control of the clerk of the works or engineer of the asylum.

THE LAUNDRY, BATH-HOUSES, &c.

In arranging the plans of a large asylum, it frequently occurs that the positions of the laundry (*vide* F, Fig. 1) and the general stores clash, and are somewhat difficult to contrive satisfactorily; but it is highly necessary to so place the laundry and wash-houses that the persons conveying the clothes to or from the male and female sides of the asylum shall not come into contact, and it is further desirable that separate receiving and delivering rooms shall be provided for each sex. The laundry, therefore, should occupy quite a central position at the rear, and not be placed entirely on the side of the asylum allotted to females, as is sometimes done.

The laundry must be provided with a large wash-house, supplied with liberal arrangements for the utilisation of *manual* labour without very much machinery, for this work is very useful as a means of occupation for many patients, and any machinery provided must certainly be guarded from the patients in every possible way. For this purpose the engine shafts might be *below* the laundry floor, the driving belts being connected from these to the machines above.

The very foul linen would be first taken to a separate receiving-room, and thence, if necessary, passed through a disinfecting apparatus into the "foul wash-house," which would be fitted up with soaking tanks and steeping pits, with washing-troughs, strainer, and rinser, and, perhaps, a washing machine. Having been first cleansed here, the linen would be passed into the general wash-house, which would probably be fitted with hydro-extractors, washing-tanks, strainers and rinsers, hand-power washing-machines, soaking and liquor tanks, and other appliances.

The wash-house buildings generally must be provided with ample means for ventilation and clearing away of steam, &c., from the various apartments, and the hot-water cisterns should be placed in convenient positions for examination and repair when necessary. The working rooms should be well lighted and arranged with the view of giving the officials every opportunity of inspecting the patients at their work. The floor of the wash-house should be of cement, with drain channels, &c.; the drying closets may be very conveniently placed between the wash-houses and the ironing-rooms. In a large asylum these must be of great capacity, as it would be insufficient to trust much to drying-grounds, although these must also be provided.

The ironing-rooms must be fitted with calenders, ironing-boards, tables, ironing-stoves, and mangles, &c.; the floors of these portions may be of wood, or wood-blocks if preferred. In connection with this branch of the work there must be a delivery-room, fitted with racks and tables for sorting the clean linen, and for its distribution to the various parts of the asylum.

The laundry and wash-houses for the nurses and other officials would be similar to that for the patients, upon a suitably reduced scale. Separate receiving and delivering-rooms would be provided only in the event of the asylum being a very large one; but there should usually be at least two rooms for washing and ironing, and a separate small system of drying-closets.

In arranging all baths for patients it is necessary to provide a space on each side, so that attendants may be able to assist or control a patient upon one or both sides—a necessity in the cases of both weakly and violent lunatics. Sufficient water-closet and lavatory accommodation must be provided near to all laundries and bath-houses.

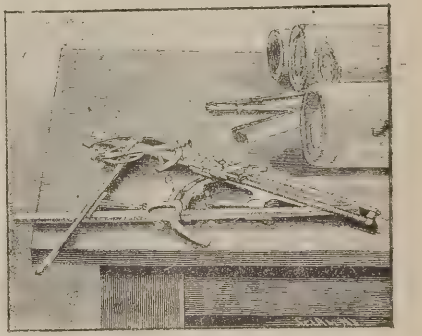
AN IMPROVED INSTRUMENT FOR ENGINEERS, SURVEYORS, Etc.

We take from the *Scientific American* an illustration of an instrument of comparatively simple and durable construction, adapted for an extended field of work. It is designed to facilitate the direct calculation of triangles without the use of plotting or other instruments, and for reading latitudes and departures for any course—down to minutes if desired—for chains, poles, and links at a single observation. The improvement has been patented by Mr. William Hinton, of Hinton, West Va. The base of the instrument supports a graduated distance scale, on which is an adjustable slide with vernier, and on the inner edge of the base is an arm connected by a pivot with a similar arm attached to a straight meridian scale, having graduations. Graduated arcs, which may be clamped together in a sliding vernier, are pivoted to the meridian and distance scales, and on the forward end of a slide on the meridian scale is an extension on which is pivoted a T-square, with head graduated and fitted on a departure scale secured to a pivot in a bracket projecting from a slide on the distance scale. On this pivot are also two arms reading on a second protractor.

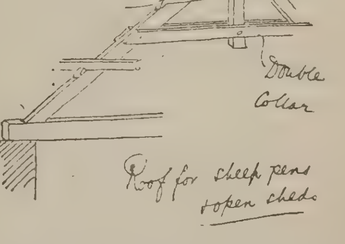


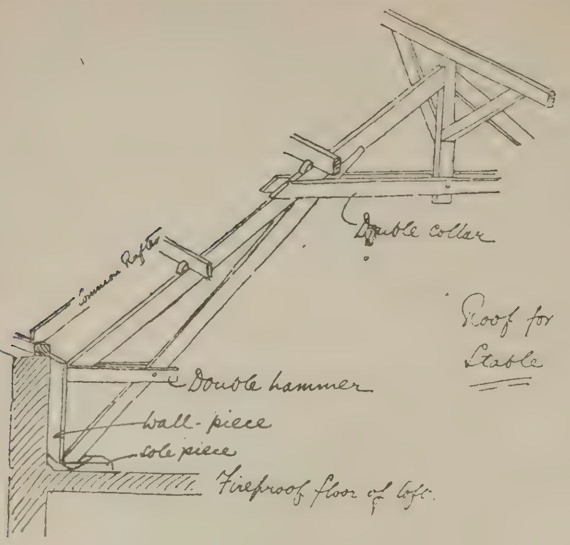
NOTES FROM THE ANTWERP EXHIBITION.

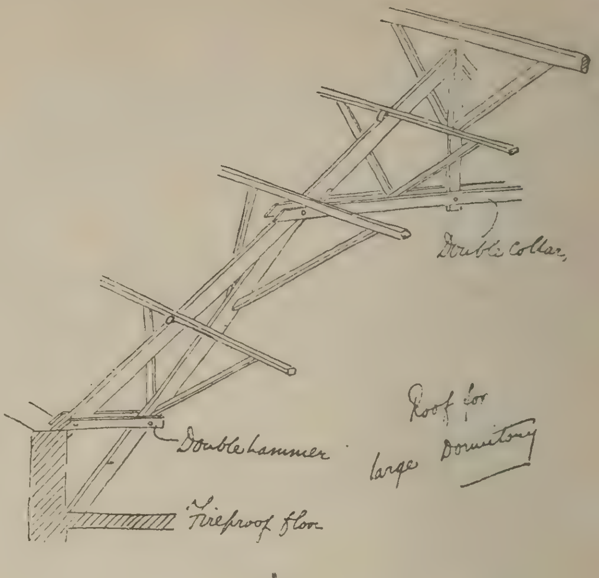
PART I.—TIMBER ROOFS.

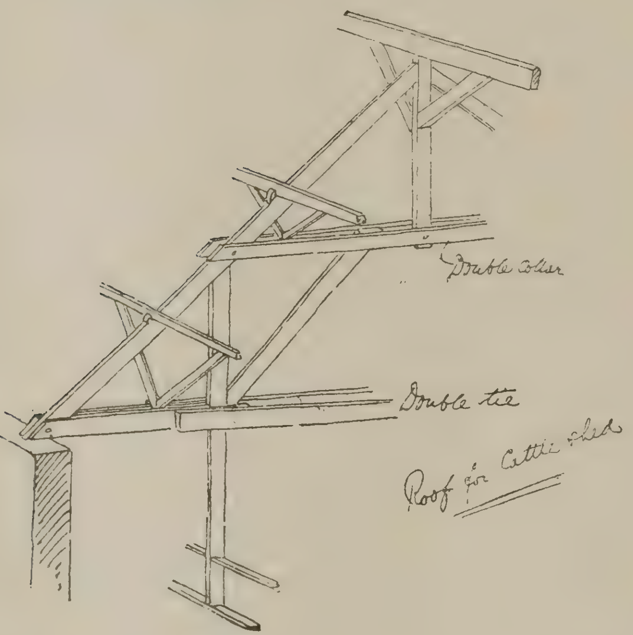
In a large exhibition like that now being held at Antwerp, there is always something worthy of the architect's attention, and in the present instance there is much. It is not that all to be seen there relating to building matters is better than what is customary in England—far from it; but, even where practice differs, a useful lesson is sometimes to be learnt from the cause of the difference, which may lead to the solution of an unusual difficulty where this cause operates with us, upon lines common elsewhere, but rare with ourselves.

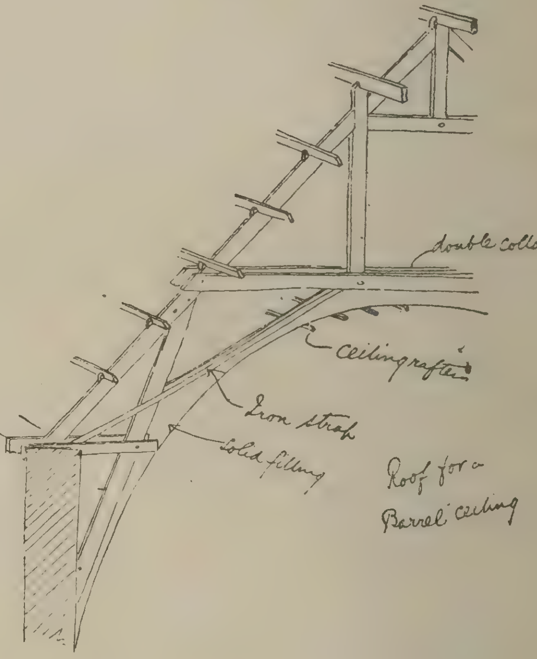
This is particularly the case with the timber roofs, of which a large number of models are shown in the Belgian section, and several of which are illustrated herewith. They are designed for a country possessing and importing small timber only for building purposes. The avoidance of stout members is very noticeable, and the substitution for them of double members, with consequent great saving of labour in the joints. Whether this simplification leads to quite such sound work as does the necessarily careful framing of English trusses may be questionable, but there can be no doubt that the system might be much more largely adopted than it is where scantling boards are readily available, and where it is desired to reduce the cost as much



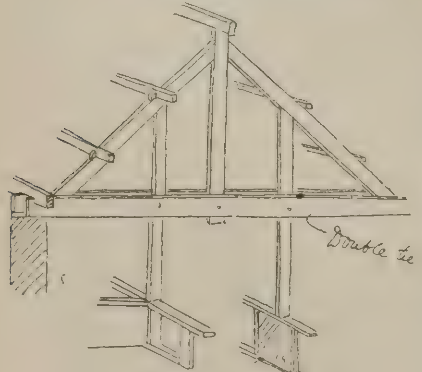








as possible, particularly in structures of a more or less temporary nature. Quite simple examples, adaptable to many purposes, are those suggested for the roofs of sheep-pens and piggeries, though in neither case, possibly, can we unhesitatingly admire the way in which the purlins are *not* supported where they occur.



Roof for Piggeries.

The way in which the ridge piece sits upon the head of the king will also be noticed in every instance, rather with a feeling of wonder than with any desire to imitate.

The want of support to the lower purlin is also the great fault to the stable roof, but, otherwise, it is a suggestive piece of construction, the fireproof floor of loft being utilised for support. The double hammer is sensible, if none too scientific, and the supporting of the ridge-piece is wise.

Both these principles are extended in the large dormitory roof. It is a pity that support to the lower purlins could not have been obtained in a vertical plane; but, even as it is, the bearing of the purlin is considerably decreased, and it is thereby rendered possible to either increase the distance apart from principal to principal, or to decrease the section of the purlin—and altogether it is a clever piece of construction.

In the cattle-shed roof, the supports to purlins have been kept in a vertical plane, and a vertical support to the end of collar is obtained from the ground, but what a terribly clumsy contrivance it is to lengthen the double tie, when timber is not procurable of the length required, in the way which is shown. It looks like amateur's work, rather than a model fit for an exhibition, and, presumably, for the instruction of others.

Want of support underneath purlins is again noticeable in the barrel roof; but the introduction of the flat iron bar as a tie is of considerable advantage, and would scarcely be noticeable from below, even were the roof unceiled. In such a case, however, the double hammers would scarcely be admissible.

It was, unfortunately, impossible to obtain the scantlings of these roofs, the models from which they were taken being to a scale of $\frac{3}{100}$ full size—too small for timbers to have been very accurately cut to.

CHIPS.

The foundation-stone of St. Francis's School, adjoining Moorland-road Board School, Cardiff, was laid on Sunday. The schools will accommodate between 500 and 600 children, and are to be built from plans of Messrs. Habershon and Fawkner, of Cardiff and Newport, Mon.

Viscountess Sherbrooke is erecting a memorial to her distinguished husband, which is to take the form of a bust, over the porch of the north door of St. Margaret's, Westminster. Mr. Ezekiel, of Rome, is the sculptor, and the memorial will be inaugurated, probably in October, by Lord Selborne and Archdeacon Farrar.

A new Presbyterian chapel at Hope, Flintshire, was opened last week. It is Gothic in style, and is built of local stone. The passages are floored with Ruabon red tiles, and the pews are of pitch-pine. Mr. J. G. Williams, of Cable-street, Liverpool, is the architect, and Mr. E. O. Probert, of Hope, the contractor. The cost has been about £1,200.

The will of Mr. Wyatt Angelicus Van Sandan Papworth, F.R.I.B.A., curator of Sir John Soane's Museum, late of 13, Lincoln's Inn-fields, who died on August 19th, was proved on September 15th by Mrs. Marian Papworth, the widow, Mr. Percival Gordon Smith, F.R.I.B.A., and Mr. Walter Ernest Boultbee, the executors, the value of the personal estate exceeding £9,000. The testator bequeaths the framed drawing, by his father, of the design for the interior of a chapel to the Royal Institute of British Architects, £100 and all the household furniture and effects to his wife, and a few other small legacies. The residue of his real and personal estate he leaves upon trust for his wife for life or widowhood, and then to his children in equal shares.

WALTHAMSTOW PUBLIC LIBRARY.—ANCHOR BUILDINGS, LEEK.—NEW PREMISES FOR THE CHESTER BOAT CO.—THE PORCH, CRANBORNE MANOR HOUSE, DORSET.—"THE DANCE OF THE ANGELS."—DETAILS OF NEW POST OFFICE AT CARDIFF.—ST. CUTHBERT'S, WELLS.—SPECIMENS OF WOOD-CARVING BY MESSRS. HERRMANN.

Our Illustrations.

THE WALTHAMSTOW PUBLIC LIBRARY.

Mr. J. Passmore Edwards is to open to-morrow the new reading-room which forms the first portion of new public library premises at Walthamstow. It measures 78ft. by 41ft., and is 30ft. high from floor to ceiling, consequently it is the second largest rate-supported reading-room in or around the Metropolis. The front facing the recreation ground is being carried out in red brick, with Bath-stone dressings; the roof principals are of steel, coated and panelled out in plaster. Special care has been taken with the lighting, heating, and ventilating arrangements. This room is connected with adapted premises, which for the present are to serve the purposes of lending, reference, and other departments. The architect is Mr. J. Williams Dunford, M.S.A., F.I.Inst., of 100c, Queen Victoria-street, E.C.; and the builder is Mr. J. W. Best, of Walthamstow.

ANCHOR BUILDINGS, LEEK.

These new premises occupy a commanding site in the old Cattle Market. This market has not yet been turned into a town garden, as shown in the corner sketch, though it may be hoped the new Urban District Council will undertake it. By suppressing the villainous advertisement hoardings, and levying a tax on every bill posted (which the law now entitles them to do) on proper town advertising turrets—as in the city of Hamburg and elsewhere abroad, where the burghers are civilised to the point of cultivating public beauty—funds might be raised for beautifying a town by the very process which removed its disfigurement. "Floreat Porrum!" Messrs. W. Sugden and Son, F.R.I.B.A., are the architects, and Mr. Grace and Mr. Isaac Heath the contractors. Materials used: Sheen stone; thin red ladder-edge bricks, tuck-pointed, white; hand-made brindled roofing tiles, &c.

NEW PREMISES FOR THE CHESTER BOAT COMPANY.

This drawing from the Royal Academy forms one of a series of the same group of buildings erected at Chester for the Boat Company, from the designs of Messrs. T. M. Lockwood and Sons, architects, of that city. We gave a description when we illustrated the other drawings in the Building News for July 20th last.

THE PORCH, CRANBORNE MANOR HOUSE, DORSET.

This illustration is a direct reproduction of a very charming water-colour drawing by the late Joseph Nash, and we are indebted for the loan of the original to Mr. Edmund Kirby, F.R.I.B.A., of Liverpool. The picture figures as the frontispiece and title-page of the third series of Nash's "English Mansions of the Olden Time," but the picture does not occur in the list of exhibited works which we published, from the pen of Mr. Roget, when we began this series of Nash's drawings early in the year.[*] By reference to the Building News for May 23, 1890, a set of measured drawings by Mr. J. E. Mowlem (for which the R.I.B.A. medal was awarded) will be found, fully illustrating what remains of this old historic mansion, which now belongs to the Marquis of Salisbury, to whose son the property gives the title of Viscount Cranborne. The sketch by Nash shows the porch in the south front of the house, which, like that on the north side, the larger of the two, was built when the architectural veneer of *cinque-cento* detail was added to the older fabric of the building. Inigo Jones erected a wing to the manor house, and built the entrance lodges and screen walling. The estate was granted to Robert Earl of Salisbury by James I. in 1612. The building was for a considerable period left in a very ruinous state; but the present marquis has had it repaired and renovated.

OLD MASTERS ON THE CONTINENT.—IX.

From the collection at the Academy of Fine Arts in Florence we select for reproduction this week a portion of the great work by Fra Giovanni Angelico da Fiesole (1387-1455), representing the "Day of Judgment," the part shown being the Dance of the Angels. The picture and other works in the Florence Academy by Fra Angelico are fully described by Mr. C. L. Eastlake in his accompanying article on p. 421.

CARDIFF POST-OFFICE.

Last week we gave a double-page plate of the main façade of this new large General Post-office, now erecting at Cardiff; and we also published with a description of the work the plans of the two chief floors. To-day we print a sheet of details from the architect's working drawings, illustrating at large the main entrance. Mr. Henry Tanner, F.R.I.B.A., is the architect.

ST. CUTHBERT'S TOWER, WELLS.

This is, of course, by no means the first time that sketches of this justly-famous Somersetshire tower have been given in the Building News, and views from other points will be found in our issues for October 24th, 1890, and January 6th, 1893, among some leading typical examples from the same county. In our first descriptive article, given on the 10th of last month in connection with our series of drawings illustrative of the Architectural Association Excursion, reference was made to Wrington, Glastonbury, Taunton, Chewton Mendip, Huish Episcopi, Langport, as well as other specimens; and St. Cuthbert's has been previously fully described. Mr. Frank W. Chapman, the author of the accompanying study, contributes it with a view of increasing the completeness of our Wells sketches, published to enhance the interest awakened by the late visit of the members of the Architectural Association to that old city.

SPECIMENS OF WOOD-CARVING, BY H. HERRMANN, LIMITED.

We illustrate on another page some examples of the excellent and numerous carved wood panels, friezes, &c., which Messrs. H. Herrmann, Ltd., of 11, Dod-street, Limehouse, E., keep in stock, and which they are prepared to supply for the many kinds of decorative work for which they are intended. Their workmanship is of the best, and though in the first place the carving is done by swift and complicated machinery, the finishing is executed by hand and by skilful carvers, thus obtaining the freedom and crispness of work done entirely by hand. The original design from which the repeats are made is, indeed, executed in the best manner possible, at considerable expense, by first-class craftsmen. Though Messrs. Herrmann keep a large quantity of stock designs, they can also, where desired, carry out special ones. The superiority of their work over that of much of the so-called carving which we are accustomed to see in cheap furniture and elsewhere will be evident to all who see the two side by side.

◆

Regarding the dispute over the ownership of the market or preaching cross at Leighton Buzzard, which Sir W. Hanmer claimed as lord of the manor, his supposed rights have been conceded to the local Town Lands Trustees.

COMPETITIONS.

Handsworth.—At Friday's meeting of the school board the chairman stated that twelve sets of competitive plans had been sent in for the new board schools in Birchfield-road. The assessor appointed by the board (Mr. W. Martin, of Birmingham) awarded the plans with the motto "1894" as the best, and these being found to be by Mr. J. P. Osborne, of Birmingham, he (the chairman) proposed that they be accepted. This was agreed to.

Owen Jones Prizes for Designs for Furniture.—The Council of the Society of Arts hold a sum of £400 on condition of their spending the interest thereof in prizes to "Students of the Schools of Art, who in annual competition produce the best designs for household furniture, carpets, wallpapers, and hangings, damasks, chintzes, &c., regulated by the principles laid down by Owen Jones." The prizes will be awarded on the results of the annual competition of the Science and Art Department. Competing designs must be marked "In competition for the Owen Jones Prizes." The next award will be made in 1895, when six prizes are offered for competition, each to consist of a bound copy of Owen Jones's "Principles of Design," and the Society's bronze medal.

CHIPS.

Mr. Francis George Penrose, M.D., M.R.C.P., of 4, Harley-street, W., the only son of Mr. Francis Cranmer Penrose, F.R.S., P.R.I.B.A., of Colebyfield, Wimbledon, was married on Thursday in last week to Mary Helen, only daughter of Mr. Laundy Walters, of Woodhays, Wimbledon.

The work of constructing low-level sewers near Old Hill, for the Upper Stour Valley Main Sewerage Board, have just been commenced. Messrs. E. B. Martin and W. J. Fiddiman are the engineers, and the tender of Mr. Thomas Vale, of Kidderminster, has been accepted at £3,370, this being about £2,000 less than the highest offer received. The clerk of works is Mr. Isaac Fisher.

St. Child's, Lichfield, representing the mother church of the Kingdom of Mercia, is about to be reseated and restored at a cost of £650. Mr. Bridgeman, of Lichfield, will carry out the work.

A church clock at Wilsden, York, made by Messrs. William Potts and Sons, of Leeds and Newcastle-on-Tyne, was publicly started on Saturday. It has four dials, one 6ft. 6in. diameter, and the others 5ft. 6in. across.

Herr Charles Rochussen, the well-known historic painter and illustrator, has died at Rotterdam, aged 80 years.

After three years' negotiations, the War Office authorities have purchased 7,000 acres of Kilworth mountain ranges, near Mitchelstown, for the purpose of establishing a large military encampment similar in extent and importance to that already existing at the Curragh, county Kildare. It is stated that the Government propose to expend £20,000 in erecting barracks and laying out the range, which is alike suitable for artillery, infantry, and cavalry exercise.

The directors of the Great Western Railway are inviting tenders for the recontruction of the Gover and Austell Viaducts, situate between St. Austell and Burngullow Stations, Cardiff, and for earthwork in connection with the widening of the line between these points.

As a tribute to the memory of the late Rev. George London, the teachers and scholars of St. George's Schools, Altrincham, have placed a font in the church, designed and executed by Messrs. J. and H. Patteson, Oxford-street, Manchester. The font is of octagonal form, in rich Derbyshire alabaster. The massive basin is supported by a column of red Devonshire marble with carved capitals, and the whole rests upon an octagonal base. On four sides are carved the sacred monogram "I.H.S.," the sacred cross, three fishes representing the Trinity, and the Paschal lamb. Round the base of the font in gold letters is an inscription.

The memorial stone of the Hardman public institute at Milton was laid on Friday. The building will be two stories in height. On the ground floor will be a wide entrance lobby, leading on the left to reading, coffee, and billiard rooms, and on the right to a library, kitchen, scullery, serving-bar, &c., and staircase leading to the upper floor, which will comprise a lecture and concert-room to seat 250 persons, with cloak and ante-rooms, and bedrooms for the caretaker. Over the main entrance will be a tower. The architects are Messrs. R. Dain and Son, Burslem, and the contractors Messrs. J. Moss and Son, of Milton. The total cost of site and buildings will be over £2,000.

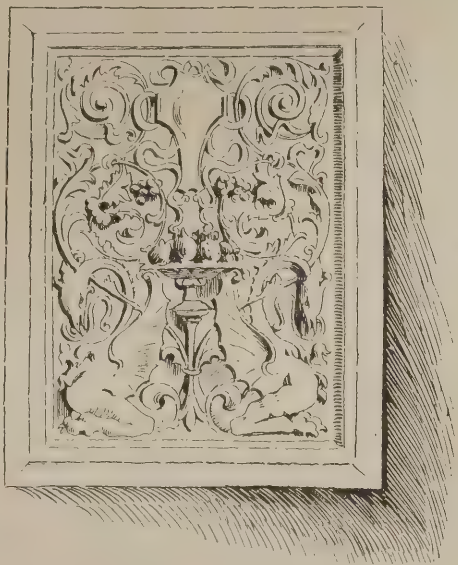
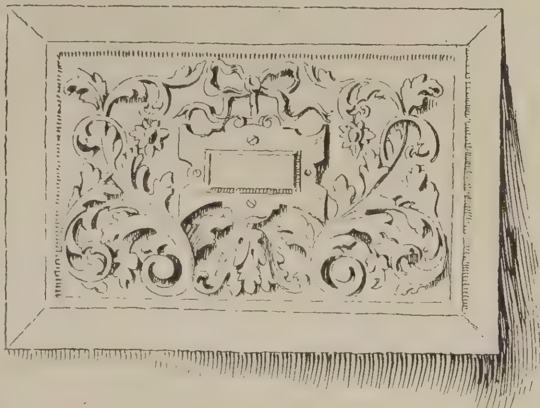
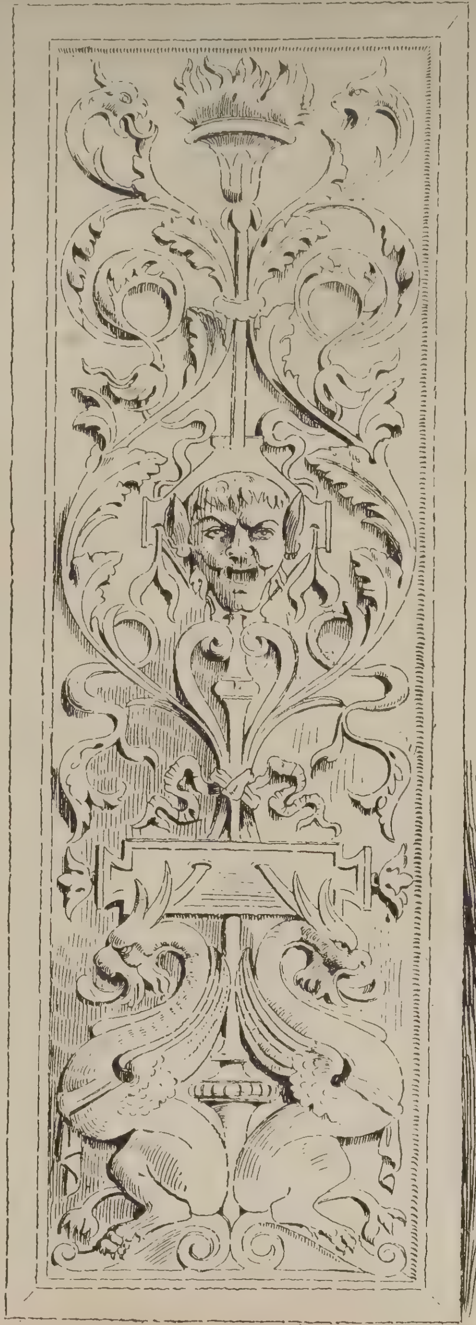
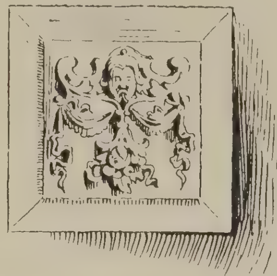
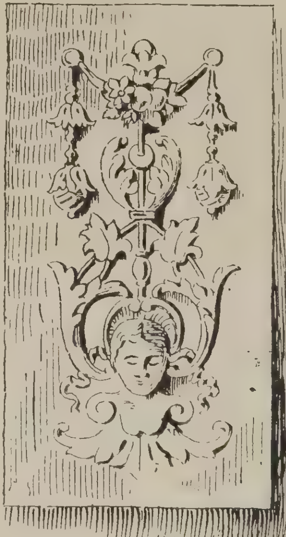
SPECIMENS
OF
WOOD CARVING
BY MESSRS H. HERRMANN LTD

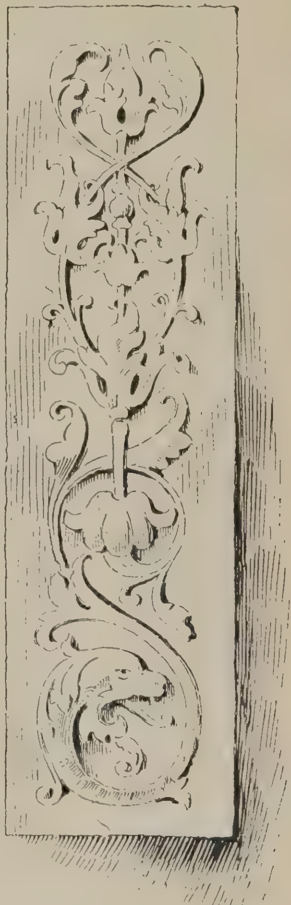












A. Ernest Chancellor Delᵗ

Dellagana Sc.

WAYSIDE NOTES

Without any special claim to a technical acquaintance with photography, I have for many years taken particular interest in the progress and development of the art which has long since certainly exceeded the limits of a mere mechanical process in the hands of such artistic manipulators as Colonel Gale, Count von Gloeden, or Messrs. Fred. Hollyer, Richard Keene, Watmough Webster, and J. T. Sandell, not to mention Messrs. Dixon, Ellis, and Fry, and among amateurs, Precentor Mann. Others could be recounted, of course, in connection with photographic development, and among them are the recipients of medals this year at the exhibition of the Royal Photographic Society, just opened in Pall Mall, which perhaps, on the whole, is not quite so remarkable as on previous occasions, though I am bound to admit the uniform excellence of the examples chosen to furnish the display.

For one thing, the Architectural subjects are not so conspicuous, and there is little novelty in the choice which has been made. The Nave of Romsey Abbey, Hants, taken from the sanctuary looking west, is a gracefully soft and delicate platinum print, by Mr. T. M. Brownrigg, with which he wins a medal. Mr. Henry Little, of Twickenham, ranks also to the fore with his bromide enlargements in illustration of the well-known Courtyard of the Palazzo Vecchio, Florence, and an interior of the Certosa at Pavia, though the iron screens in this building hardly come out sufficiently defined to satisfy an architect. The porch of Canterbury Cathedral, by Mr. W. Thomas, deserves a note for exquisite crispness in detail to a small scale, even if the platinum print is cold-looking and the parapet fogged rather, where the upper part looks somewhat out of focus. Mr. Court Cole shows Sir Arthur Blomfield's concrete Basilican Church interior at Oxford, and among other views a beautiful altarpiece in one of the college chapels in the same University. Messrs. Bedford le Mere's exhibits are good, of course, as photographs; but the buildings shown are generally lacking in interest.

Of the pictorial landscapes and river views, with which so much excellent work is displayed, it is not easy in a concise note to single out those of exceptional merit, and before reverting to them I must refer to the grand set of three big prints of "The Story of Psyche," by Mr. Harry Bates, A.R.A., shown by Mr. Fred. Hollyer. If I had a choice, this would be my prize from this exhibition. "Harvesting in Norfolk" is a medal picture by Mr. A. Horsley-Hinton; and Mr. James A. Sinclare, who shows a charming set of character studies in carbon prints, wins a similar prize for his "Sunshine and Shadow," wherein some women are washing at the edge of the stream. The picture has much the character of a watercolour. "The Village Well," in front of a queer old cottage, struck me as a particularly pretty study well worthy of its author, Col. Gale. Mr. H. Sandland's life studies of Lions and Tigers at the Zoo leave nothing to be desired, and Mr. Gambier Bolton's "Brown Owls" from life are also deserving of the highest praise, I think.

An entirely new view of St. Paul's Cathedral, in consequence of the demolition of a big block of buildings on the south side of the Churchyard, to make room for the new premises of Messrs. Pawson and Co., can now be obtained, and when the afternoon sun may again be caught shining on the west front, a hitherto impossible glimpse of the clock-tower and dome is obtained to good advantage from the courtyard in front of the Deanery. Other buildings in Doctors' Commons are coming down shortly for an enlargement of the Post-office Savings Bank in Knightrider-street, so a still more extensive view of our great Metropolitan church will soon be opened up, both for the artist and photographer. As a new widened roadway is to be formed leading southwards from the well-known archway refaced by Wren, and once the Prerogative Court Office in the angle of the churchyard, it is to be hoped that a permanent improvement will ere long be accomplished for the convenience of the public by the Dean and Chapter of St. Paul's. The gateway, too, is to come down, and probably a larger one built in its place. Here it was that Sir Christopher Wren had his offices, and perfected his designs for the Cathedral. For some time it furnished the great architect with an official residence.

An extraordinary development is going on at East Ham, which is being rapidly transformed from a village into a densely-peopled suburban district. At the last meeting of the East Ham local board the surveyor, Mr. W. H. Savage, reported the receipt of plans for no fewer than 310 new houses. Of these, 114 were proposed to be built in Monega-road, and 101 in Halley-road. Fifteen new streets have been laid out in the district since New Year's Day.

I see that the ancient home of the Leche family in Watergate-street, Chester, one of the most picturesque half-timbered buildings in that interesting city, has become untenanted, and as it is in a state of great dilapidation, it is to be feared that it may be razed to the ground and reconstructed on modern lines unless someone steps in to acquire it for the sake of preserving its artistic front. The "ladies' bower" contains the Leche coat of arms over the original fireplace, and the oak carving running along the whole length. The carving on the Watergate-street façade is vigorous, if somewhat coarse and even indelicate in parts, as judged by 19th-century ideas. Mr. Ivison, a Chester artist, is appealing for measures to be taken to preserve the house. If the corporation of Chester are wise they will purchase, renovate, and re-let the building, for the city profits largely by the visits of Englishmen and Americans in search of the picturesque, and can ill-afford to lose one of the half-timbered houses that have rendered it famous.

In the representation on the City Court of Common Council of Bishopgate Ward, one architect has succeeded another, Mr. Albert Edward Pridmore, M.S.A., having been returned at the head of the poll, in succession to the late Mr. J. Hammack. Mr. Pridmore is just 30 years of age, was articled to Messrs. John Giles and Gough, subsequently assisted the late Mr. Alexander Peebles, afterwards City architect, but for some years past has practised in Broad-street Buildings. He is a Fellow of the Surveyors' Institution, and a Member of the Society of Architects. He has been commissioned by his parish to assess the new Liverpool-street station for the poor rate, and was one of those invited to compete for the Bishopgate and Cripplegate Institutes. Mr. Pridmore is a partner in the firm of Pridmore and Anderson, of Watford, where he resides.

The First Commissioner of Works will be asked next session to provide a new courthouse in which to hold the Old Bailey Sessions. The present structure is, both in external appearance and in internal arrangements, utterly inadequate for the supreme Criminal Court of Assize in London. Its position is poor; it is inconveniently small and crowded, and, notwithstanding recent improvements, its ventilation is still exceedingly bad. One suggestion is that accommodation for the Central Criminal Court and for the Court of Criminal Appeal should be found near the New Law Courts—possibly on the west side of Chancery-lane, opposite Mr. John Taylor's new Record Office extension, which has now reached its full height.

One of our rising young artists is Mr. Bernard F. Gribble, a worthy son of an honoured father, the architect of the Brompton Oratory. Mr. Gribble, who is working at the Trafalgar Studios, Manresa-road, Chelsea, has just completed some designs in both oil and water-colour. One, which he calls "Life on the Thames," is a suggestive view of our great waterway near Greenwich. A steam tug is bringing out a great iron merchant vessel—the sense of active force in the busy little steamer being cleverly opposed to the idea of helplessness in the inert leviathan she is towing—whilst the grey, misty river is alive with more or less indistinctly seen craft. This work is going to Birmingham, for exhibition at the Marine Gallery there. A sea study, rather recalling Henry Moore, is "A View outside Monaco," representing the lovely blue-green waters of the Mediterranean under pale azure sky, flecked with light clouds. A distant ship or two add interest, but do not detract from the simple motive, so difficult to render, of a mass of gently undulating sea-waves. Mr. Gribble's "Antwerp Cathedral" is a view of the quaint old city, with the famous cathedral in the centre, as seen from the Tête de Flandre.

OBITUARY.

In the death of Baron Jean Baptiste Bethune, President of the Belgian Archæological Society of St. Thomas and St. Luke, Belgium has lost one of its greatest archæologists, and the Society of Architects a most distinguished honorary member. Baron Bethune was a Knight Commander of the Order of St. Gregory the Great, a Knight of the Order of Leopold, vice-president of the chief Belgian antiquarian societies, and honorary member of many Continental societies devoted to archæological research. In early life Baron Bethune was attached to the Belgian Legation in London, and he visited England so recently as last year, when he attended a *soirée* given by the Society of Architects, and testified in an eloquent speech to the admiration for English architecture which his fellow-countrymen possessed.

On the 4th instant Mr. John Cunningham Moncrieff, F.R.I.B.A., died of acute consumption at his residence at Victoria-square, Clifton. Mr. Moncrieff was the second son of the late Alexander Moncrieff, Writer to the Signet, Perth, N.B. He received his primary education at St. Andrew's H.B., and after two years at the Universities of St. Andrew's and Edinburgh was articled to the well-known firm of Brown and Wardrop, of St. Andrew's-square, Edinburgh. After his articles expired he went to London, and became an assistant of the late G. E. Street, R.A.; after that he commenced practice in Bristol, where he carried out many important works. He was elected an Associate of the Royal Institute in 1882, a Fellow in 1886, and vice-president of the Architectural Association for Bristol for two years, and was appointed by the Royal Institute on the Federation Committee for the West of England, held in London, 1886. He erected many mansions, churches, &c., throughout England, and also restored several ancient churches. He was the architect employed by Sir John Henry Greville Smith, Bart., in connection with the erection of his new lodge at Ashton, near Bristol, and may be remembered as one of the most prominent architects in the competition for the proposed new Palace of Justice at Lisbon. Although comparatively a young man, he had an extensive and successful practice. He was buried at the church, Easton-in-Gordano, near Bristol, on the 8th inst.

CHIPS.

The foundation stone of a new church was laid by the Duke of Devonshire at Barrow Hill, near Staveley, on Saturday.

The council of the Society of Engineers have unanimously elected Mr. Perry F. Nursey, a past president, and for 36 years a member of the society, as honorary secretary and treasurer, in place of the late Mr. Alfred Williams, who had occupied the position since the foundation of the society in 1854.

Great activity is being shown by the rival railway companies at Bodmin just now. Operations have commenced at the Great Western Railway station for making considerable alterations for the accommodation of goods traffic. Messrs. Relf, the railway contractors, have engaged to remove 15,000 yards of stuff from between the north line of rails and the Barracks-road, for providing space for loading and discharging cattle, and for a coal-store and siding. Preparatory work has also been begun by the same firm on the South-Western scheme to connect Bodmin with the South-Western Railway system. A line was already in existence, but not fit for passenger traffic, and the level crossings, and roads and lines running parallel with no division between them, will be abolished.

The new English Presbyterian chapel, Caergwrle, was formally opened on Sunday. The style is Gothic, and the walls are built of local stone, relieved by dressings of Windyhill stone. The building has accommodation for 250 persons. The architect is Mr. T. G. Williams, M.S A., 3, Cable-street, Liverpool, and the builder is Mr. Probert, Hope, Mold.

Mr. Rienzi Walton held an inquiry at Altrincham on Friday into an application of the local board to obtain sanction to a loan of £3,500 for the purpose of street improvements. There was strong opposition to the proposal.

The old clock at the parish church of South Kirkby, near Wakefield, having for some time been very irregular, a new clock was ordered from Messrs. W. Potts and Sons, clock manufacturers, of Leeds and Newcastle-on-Tyne, who have just completed the same from the designs and plans of Lord Grimthorpe. At the dedication service held on Thursday last, at the opening ceremony the sermon was preached by the Lord Bishop of Wakefield.

SANITARY CONGRESS AT LIVERPOOL.

THE fourteenth annual congress of the Sanitary Institute was opened at Liverpool on Monday, and has been continued throughout the week; it has been very largely attended, the number of members being double that enrolled at any previous gathering of the kind.

On Monday the members were formally welcomed to the city by the Lord Mayor of Liverpool, and after luncheon at an hotel, the members assembled in the lecture theatre of University College. Sir Charles Cameron, of Dublin, the retiring president, introduced his successor, Sir F. S. Powell, Bart., M.P., who then delivered the

PRESIDENT'S INAUGURAL ADDRESS.

Sir Francis Powell dealt in a comprehensive and general manner with the work of sanitary progress, restricting himself within the boundaries of public health as affected in England and Wales by administration and by law. It was impossible to survey the field without a sense of satisfaction, almost of triumph. The difficulties which hindered their progress diminished both in area and in gravity. Improvement in public health had justified both the cost and the labour expended. The Local Government Board had during the last twenty years sanctioned a capital expenditure, chiefly for sanitary purposes, of £53,021,334 in urban, and of £3,923,270 in rural districts, while during the same period local Acts had authorised a further expenditure of £67,335,956. Vital statistics abundantly proved the wisdom of such expenditure. As to general sanitation, administration rather than legislation now demanded the energies of the sanitary reformer. The London Building Acts of 1891 and 1894, following similar enactments for the provinces, supplied for the time the wants of the Metropolis. But domestic buildings in London might still be erected to the height of 80ft., exclusive of two stories in the roof, power being unfortunately reserved to the London County Council to sanction the construction of buildings even of more gigantic proportions. Air and light could not perform their life-giving functions at the base of those structures, still less within courts inclosed in them. It was not an exaggeration to say that the dwellings of our nation were being built in the course of the present half-century. The erection of new houses and the destruction of old were everywhere seen. They were erected under by-laws for the most part wise, and were maintained under regulations conducive to health. Errors of judgment hindered progress. Doubts were already expressed as to the system of huge constructions under the name of artisans' or model dwellings. The Mansion House Council described certain blocks of artisans' dwellings as a “difficulty which wants promptly dealing with.” “These,” said their committee, “have been erected without any regard to sufficient air and light around them.” In the cases of private dwellings and of model lodgings the tenant had his duty to perform as well as the owner. It was difficult to believe that children who passed long and pleasant hours in cleanly and well-ventilated schools would rest content with dirty and unwholesome dwellings. The factory and workshop not less than the dwelling were comprehended within the wide range of the sanitary province. Increased security against accident, improved appliances for ventilation, and general conditions creating greater physical comfort during the hours of labour would increasingly improve the health of the artisan population. It would not suffice to guard the workshop and the dwellings from injurious influences within. The health of the people could not be sound if the air were polluted, and the working classes might discover that the smoke which rendered cleanliness difficult and the brightness of a home impossible, imposed upon them labour which was unnecessary, and cost which might well be spared. The President proceeded to refer to the legislation dealing with processes dangerous to the health of workers, and went on to speak of river pollution. We could not hope by one effort in one generation to restore our streams to their original purity. But we could do much. The River Pollution Bill would be reintroduced in the next session; the Bill had been twice submitted to the House of Commons; but he was not without hopes that Government would grant an inquiry by a Select Committee. The Infectious Diseases Notification Act had, in March, 1894, been adopted in 761 urban districts and 473 rural districts. The great majority of our population was subject to the provisions of that Act. The exhaustive report of the Royal Commission on the Metropolitan Water Supply claimed the fullest consideration. In conclusion, the President urged his hearers not to wait longer for new laws, but to put into effect those already on the Statute-book.

In the evening the Lord Mayor of the city opened the Health Exhibition in the Drill Hall, Upper Warwick-street.

The following are among the awards declared:—J. Cliff and Sons, Wortley, Leeds, Cecil porcelain slop sink; Joseph Cliff and Sons, Wortley, Leeds, imperial porcelain bath; Doulton and Co., Lambeth, metallo-keramic joint for connecting lead to earthenware; the Incandescent Gas Light Company, London, incandescent gas-light (Welsbach system); Bowes, Scott, and Western, London, automatic flushing grease trap; Joseph Cliff and Sons, Wortley, Leeds, white and coloured glazed bricks; Joseph Cliff and Sons, Wortley, Leeds, imperial porcelain kitchen and scullery sinks; Doulton and Co., Lambeth, glazed fireplaces; J. Duckett and Son, Burnley, rest for setting drain traps level; Newton, Chambers, and Co., Thorncliffe, near Sheffield, izal disinfecting fluid; Renton, Gibbs, and Co., St. James's Works, Mill-street, Liverpool, hot-water grate; Thomas W. Twyford, Hanley, ideal sinks and supports in enamelled fireclay; Thomas W. Twyford, combined “C.V.” and athena lavatory basin. Twenty-four exhibits have been deferred for practical trial.

On Tuesday, a series of conferences were held at University College. The municipal and sanitary engineers met under the presidency of Mr. A. M. Fowler, M.Inst.C.E., who urged that the housing of the poor was still far from satisfactory, He found fault with the night ventilation, and the crowding together of so many individuals in one building, which were characteristic of many blocks of artisans' dwellings, and he considered that the back-to-back house self-contained, so extensively constructed in Leeds on the modern plan, was the best type of house for the working classes. As to the street surfaces, he advocated improved wood pavement, or the improved asphalte, and constant removal of filth from the streets. The importance of securing a soft-water supply for domestic uses, and for generating steam in boilers for motive power, could not be over-estimated, for there would be a saving in all domestic expenditure. Dr. Francis Vacher presided over a meeting of sanitary inspectors, and Dr. C. E. Paget over a similar gathering of medical officers of health. In another room the “Sanitation of the Passenger and Mercantile Marine Service” was discussed, with Sir W. B. Forwood in the chair, and a meeting on “Domestic Hygiene” was presided over by the Lady Mayoress. At this latter meeting Mrs. H. Percy Boulnois read a paper on the subject of “The Ethics of Sanitation.” She contended that sanitation should be the crusade of the 19th century, being necessary for the mental, moral, and physical advancement of the race. To do this the cultured must learn first and then teach their poorer neighbours. They should encourage reverence for the sanitary inspector, and show the great importance of sanitary legislation. She dealt with the evils of the present burial system, and contended that cremation should be encouraged from principles of altruism, the watchword of the day.

In the evening a lecture to the Congress was delivered by Dr. G. B. Longstaff, member of the London County Council, on “The Overcrowding of Houses upon Land.” Too much attention was given, he held, to zymotic diseases, which caused but one-sixth of the deaths in England and Wales, and too little to diseases of the lungs, including phthisis, to which one-fourth of the total deaths were due. A constant supply of fresh air was of paramount importance—of more importance even than drainage. If they could not make people ventilate their rooms they could at least see that there were sufficient windows to their rooms, and an abundant access of fresh air to their houses. Parks and playgrounds, cycling and volunteering were all of great importance, but they were not all that was wanted. They could not be enjoyed by all, and to the toiling mother of a family no less than to her young children a mere backyard was of daily and almost hourly importance. The evils of overcrowding in buildings and the evils caused by the crowding together of houses, had been statistically proved; but it scarcely needed statistics to prove that rooms to which air had difficult, and sunlight no, access, were unfit for human habitation. He condemned the overcrowding of buildings, which resulted from the houses known as “back-to-back” houses, and from very narrow streets. The difficulty in regard to these could only be overcome by large schemes of rebuilding and the adoption of additional streets. He had long ago come to the conclusion, in which he was amply confirmed by conversations with surveyors of large estates, that the carrying out of reconstruction schemes would be greatly facilitated if the municipality were made the authority for closing and diverting highways. The municipality was now the controlling authority as regarded new streets, and it should have correlative powers. He had a great antipathy to grandmotherly legislation, and thought that in some respects our sanitary laws had already passed the just limit of interference with the liberty of the individual; but the evils of streets badly laid out, and of houses improperly crowded upon the land, were so great and withal so enduring—the evil, moreover, was one that could only be dealt with by an external controlling authority—that he was convinced that this was one of those cases in which the Legislature was bound to interfere and to confer ample powers upon the municipality.

On Wednesday, Section I., “Sanitary Science and Preventive Medicine,” was opened by an address from Dr. E. E. Klein, F.R.S., on the etiology of typhoid fever, followed by papers and discussions.

At the conference of sanitary inspectors, which concluded in the afternoon, it was urged that inspectors under public bodies should be more firmly established in the tenure of their office, and that in the interests of public health the institute should not grant certificates unless the persons examined could claim several years' practical experience. A resolution in support of the latter proposal was rejected.

Yesterday (Thursday morning) Mr. G. F. Deacon, M.Inst.C.E., the President of Section II., “Engineering and Architecture,” gave his inaugural address. He traced the sanitary progress of Liverpool since 1865, and showed that since 1876 the relative death-rate of the city had very materially decreased, owing to better water supply, the prevention of leakage, the adoption of a constant system, and the introduction of the supply from Lake Vyrnwy, new sewerage, and the removal and destruction of refuse. Papers were afterwards read by Mr. H. Percy Boulnois, M.Inst.C.E., the city engineer (and hon. secretary to the Congress), on “The Housing of the Working Classes: Tenement Rooms or Dwellings in Flats”; by Mr. W. Goldstraw, the city surveyor of buildings, on “Sanitary Powers Relating to the Housing of the Working Classes”; by Mr. William Spinks, of Leeds, on “River Pollution”; by Mr. W. Henman, A.R.I.B.A., Birmingham, on “The Purification of Air emitted from Infectious Diseases Hospitals”; by Mr. Robert Williams, A.R.I.B.A., on “The Nation's Wealth”; and on “The Tub and Pail Systems,” by Mr. George J. C. Broom, borough engineer, St. Helen's. Papers on “Water Supply” were read by Professors Edward Hall and Henry Robinson, the latter dealing with the subject generally, the former with that of St. Helen's, Lancs.

The vice-presidents of the congress are Mr. C. H. Beloe, M.Inst.C.E., Sir Douglas Galton, Mr. Henry Hartley, F.R.I.B.A., Professor Hele-Shaw, and Sir R. Rawlinson; and the hon. secretaries are Major Lamorock Flower, Messrs. Edmund Kirby, F.R.I.B.A., W. Howard-Smith, and Coard S. Pain. The hon. local secretaries of the Congress are Mr. H. P. Boulnois, M.Inst.C.E., the city engineer, and Dr. E. W. Hope, the medical officer of health.

To-day (Friday) Section III., “Chemistry, Meteorology, and Geology,” will be opened by an address from Dr. T. Stevenson. The closing general meeting will be held at 5 p.m., and at 8.30 an address will be given to the working classes in the Picton Lecture Hall, by Sir J. Crichton Browne, F.R.S., and for to-morrow excursions are arranged to Lathom House, near Ormskirk, and to Eaton Hall.

◆

The Bath city council decided on Tuesday, by 18 to 12, that the city surveyor (Mr. R. Read) be paid £250 for assistance to be granted Mr. Fox, C.E., in carrying out the new waterworks at Newent, and that someone should be appointed to assist the surveyor in the work of inspecting new buildings in course of erection.

DRAWING FOR REPRODUCTION.*

THIS subject, though more particularly treated of by Mr. C. G. Harper in his recently published "Handbook" for the instruction of book and magazine illustrators in what is called "black and white," cannot fail also to be of interest to the architect and the architectural artist or draughtsman, and, therefore, we may with advantage direct the attention of our readers to his little volume. Its pages will obtain a further importance possibly to some on account of Mr. Harper's forthcoming lecture on "Architectural Illustrations," to be delivered in January next before the Architectural Association, though the book itself scarcely mentions this highly important branch of the subject; indeed, the writer seems hardly aware of the advances made by photo-lithography as far back as the "sixties" in the pages of the Building News towards an improved method of the more technical and artistic treatment of architectural illustration. Without attempting to discuss with our author the æsthetic value of such renderings as these productions of that time really possessed, we very much question the accuracy of his statement that all illustrations by "process" previous to 1880 might well be destroyed and no harm done, save perhaps the loss of much evidence of a documentary kind. It may be so, generally speaking, with the ordinary type of newspaper or magazine illustration; but even allowing for the "black and white" man's usual want of appreciation of architectural design and detail, we hardly think a more exact knowledge would countenance so sweeping an assertion as this, to which exception may with justice be taken. We presume, however, that Mr. Harper's remarks are intended to apply to the more limited view of his subject, which hardly includes that with which his paper at Conduit-street will be expected to deal. The instructions, which give a practical value to his handbook, are clearly the outcome of experience, and the illustrations accompanying the letterpress exhibit the relative values of the photogravure, Chefdeville, bitumen, and swelled gelatine processes. We must refer our readers to the treatise itself for details of these, and also for the suggestions printed as to the different advantages of certain pens, inks, and papers. For most purposes, however, Whatman's hot-pressed papers and Mitchell's "F" steel writing pens, used with a good "fixed" liquid black ink, will be found to answer perfectly well. The American method of "splatter work" is described, and the air brush for kindred effects of tone is another trick enlarged upon for the advantage of those who wish to try their hand at this sort of thing. "Half-tone" processes receive adequate attention, and in this branch of the subject the reader is introduced to Day's "shading mediums," which are more useful for magazine printing; the same remark being applicable to the "scratch-out" clay-boards, made by Augerer and Göschl, of Vienna, or Gillot, of Paris. Both of these methods do not allow more than a slight reduction of scale in the reproductions, on account of the printed granular or lined surfaces of the blocks employed.

Mr. Harper's remarks on "styles and manner" are exceedingly entertaining, and his observations on some contemporary illustrators may thus be sampled. The "pretty" convention adopted by Mr. Herbert Railton is described as having nothing except a remarkably novel technique to recommend it. He could draw an elevation in a manner curiously feminine, but he could only repeat himself and his trees; his landscapes were insults to the imagination, inspired by nothing beyond achievements of pictorial confectionery. This sort of artistic influenza was catching; but it could not possibly last, it was so resourceless. Everything in this manner wore the romantic air of the "Moated Grange," whether the subject was a ruinated castle or a new warehouse. This offensive apotheosis of raging skies and falling smuts, of impending chimneys, crumbling stones, and tottering walls was only a personal manner. Its imitators have rendered it ridiculous. The chief merit, says Mr. Harper most rightly, of such topographical and archæological drawings is when they are truthful and reverent. Mr. Railton's drawings in Mr. Loftie's "Inns of Court," or his "Westminster Abbey," he considers of "no historic or artistic value whatever." Sir George Reid and Degas are more commendable as devoid of the braggart assumption of "side." Caldecot is described as a dangerous man to copy, as there is no technique but only characterisation in his work; and Mr. Phil May's gay and festive humour is replete with a marvellous economy of line, though we understand his studies are really based upon the most elaborate pencil drawings. "Mr. Walter Crane has any time these last ten years been the great apostle of Decoration plus Socialism. It has been given him in this wise to make (in theory) the lion to lie down with the lamb (and yet for the lamb to remain outside the lion with his destiny of mutton still in perspective), and he has proclaimed in parables the possibility of mixing oil and water. He has perpetrated a cartoon for the Socialistic if not Anarchist 'First of May,' and therein he has striven to decoratively treat the British workman.* But although Mr. Crane has a pretty trick of decoration, he was worsted in that bout, for the British plumber or the Irish hodman is stubborn material for decoration, and their spouses as festal nymphs are not convincing visions." The bravery of our London firemen and policemen deserved a better fate than the Democratic valour cartoons by Mr. Crane in the Red Cross Hall, and although his revolutionary verses in praise of brotherhood and equality point to an equal distribution of this world's good things, Mr. Crane has nevertheless accepted the mastership of a Government Art School at Manchester, under the direction of that not very revolutionary body, the Committee of Council for Education. "Decoration," adds Mr. Harper, "is made of sterner stuff!" "Indeed, the decorative work of the students of the National Training Schools may be put in the formula of one-third Crane, and the remaining two-thirds Heywood, Sumner, and Lewis Day, an amalgam ill-considered and poorly wrought." Mr. Beardsley's work is "morbid and neurotic, with a savour of Bethlehem Hospital and the Charnel-House"; while Mr. Selwyn Image is devotional, keeping his art on the model of the Monkish Scriptorium. The book concludes with some admirable remarks on photography and "painters' pen drawings," with a few capital specimens. Mr. Harper hardly does justice to Mr. Pennell by the one unhappy inferential remark in which that artist's name alone occurs in the book—viz., on page 143.

SPECIFICATION WRITING.—I.†

IN reality, an architect commences to write his specifications when he commences his drawings,—one involves the other. The knowledge requisite for the one is as necessary for the other, and as the lines are drawn, the specifications form themselves. The insight into construction necessary to draw correctly indicates the ability to describe the work shown on the drawings. Without this ability the drawings and specifications alike will be failures. There is no one thing in our profession that has as much to do with personal success in its practice as the ability to properly prepare specifications. And I do not in stating my idea as to relative importance, except the question of design; because to one person able to discriminate at all between good and bad design, there are a great many who very clearly distinguish between good and bad business ability, and who will not fail to express their opinion of the architect who does not properly protect them—who, for instance, forgets to specify the stripping of walls, or the traps on plumbing fixtures or the rain conductors. And the fact that the exterior of his house is an architectural "dream," or that the detail of his mantels and stairway is "out of sight," will, in a certain sense, be only an aggravation of the offence—a sort of adding insult to injury which he will not forget. And your chance of making a living at your profession, not to speak of a fortune, which is hardly possible—at least, I have never heard of an architect dying rich—depends upon the reputation you make as a careful practitioner. To carefully write your specifications is indispensable to successful and conscientious supervision of the work; it is impossible where they are drawn loosely or in a slovenly manner, and it is not worth while to handicap yourself in this way, and add unnecessarily to the inevitable load of responsibility and worry which will come legitimately with the practice of your profession. It does not do for a professional man to make mistakes, and there is no hiding them in building; they are apparent for all time, and, like the fly in the pot of ointment, spoil the whole. Mistakes are two-edged swords. They destroy your client's confidence, and your own, the latter, perhaps, more disastrous to you than the first. Of course all this philosophising applies also to the drawings; but if you prepare your specifications with care and minuteness, you will escape most of the pitfalls, and they will greatly help you to accuracy in the drawings. The specifications bear somewhat the relation to the drawings that the arteries and veins do to the body, and they should, like them, extend from the foot to the head; from the footing stones to the cresting of the roof, and ramify in all directions, covering each little point of construction and material. They cannot be too full. Nobody ever got into trouble because he too minutely described the work to be done, or the materials to be used. To draw good specifications requires exact knowledge. You must know precisely what you want, and how you want it done. Your directions must be specific, as the name implies, and clear and simple in expression. Make your paths straight, so that the wayfaring man, though a fool, shall not err therein; but make them narrow as well, so that he shall not have room to wobble. It does not follow necessarily that he will be a fool, though it has sometimes seemed to me that nothing short of idiocy could explain what seems to be an irresistible impulse that forces the average workman to do things exactly the wrong way, when the reverse is really easier. It does not do to specify things generally, or to assume that "Oh, they will understand that." Believe me that they will not; if there is any possibility of a misunderstanding, it will be embraced. Do not leave your phrases until they are clear beyond any possibility of ambiguity, remembering always that it is too late to change the specifications after the contract is signed, and that it may be exceedingly inconvenient to have to explain clauses which are capable of more than one reasonable construction. It is a great help to use the trade terms, names, and grades. The builders understand them, and it will enable you to ascertain more readily whether you are really getting what you specify, and where it is practicable I would specify materials which have their quality marked on them. But, unless you have some reason for requiring a particular make, it is better to specify two or three makes, equally good, rather than the make of any one manufacturer. I know no class of men more disinterestedly honest than architects, or who so little let questions of money or profit have any bearing on their professional conduct. But it is possible that a misconstruction may be put upon a perfectly innocent act, and the requiring of the product of a particular manufacture may give rise to question, particularly if there are other goods of the same grade and general worth in the market, and it is well to avoid even the appearance of evil. In addition to this reason, which I express with some hesitation, and which I am very well aware may be open to the charge of timidity, there is this other—that to close out the goods of all manufacturers but one, destroys the chance of competition. That these remarks are perhaps rather less practical than ethical is true, but they have something to do, nevertheless, with what has been my practice in preparing specifications. The sin peculiar to the specification is the sin of omission, and the greatest particularity will hardly insure against it. I use as a sort of safeguard a scheduled synopsis, and use it always, which I will show you and explain farther on, and which I have found of the greatest use, but which must be added to continually as the complexity of work and the increase in the number of appliances and methods become greater with the passing of each year. In making drawings it is my custom, and that of other men as well, I have no doubt, to print upon them many notes as to things not of a nature to be clearly shown by the drawings, placing the notes on the parts to be explained, noting girders, beams and their sizes, sizes of flues and their linings, if any; finish of rooms; kind of flooring; kind of glass; and many other matters of that kind. They are really part of the specifications, and should be specified in them also, or, at least, attention called to the fact that such notes are to be taken as part of the specifications, in the general clauses of the specifications to which I will refer later on. One advantage of placing these notes is:—First, that as they are made at the time the drawing is made, they are fixed there once for all, and are not liable to be forgotten, as they may be if you wait until you write the specifications; and secondly, that they are right before the builder's nose when he looks at the drawings, and he is not likely to miss them. A not very usual thing, but a very convenient addition to a specification, is a table of contents, giving the page-number, and a list of the subjects on the page. It saves a good deal of time in the use of the specifications, and is very little trouble. And somehow, as there is never enough time, and always too much trouble going, any labour and time-saving devices are of value. The working or detail drawings, in contradistinction to the contract drawings—i.e., the plans and elevations—are the final exponents of the contract drawings. These drawings are made up from the contract drawings and the specifications, from which last the methods of construction, size, and kinds of materials must be derived. They embody both, and if it were possible to make the working drawings with the contract drawings before estimates are made, the specifications might be shorter, which would be desirable; and as it is impossible to make in many cases the word *written* as readily understandable as the word *drawn*, there might be less misunderstanding, which would be still more desirable. In this connection let me say that exact and minute specifications and full working drawings will enable you to build cheaply, an important thing to your client, who, if he be like most of us, is generally scheming to get a dollar's worth for 90 cents, because the bidders will not have to allow so much for "laps and slams," for the things not clearly shown or definitely specified, but which look the larger and more dangerous because they are undefined. As a general thing, when great differences in the amounts of bids occur, you may make up your mind that there is some want of clearness or of particularity in the specifications of drawings. The exception to this rule is caused by the irresponsible bidder who throws his hat at the drawings and guesses how much the work is worth, and who is either very high or very low; but, in fact, he should not have a chance to bid, as generally his hope triumphs over his experience, and he bids low, and sometimes gets the building, to the ultimate scamping of the work, his own loss and also the owner's, and to the despair of the architect. It is this sort of bidder who grizzles the locks of the superintendent, and eventually brings his grey hairs in sorrow to the grave. Avoid him if possible, and care and firmness will generally enable you to dodge him; but you must avoid him before he bids—afterwards it may be too late, for your client having the easy idea that the architect is paid to watch the builder anyhow, is apt to turn a deaf ear to your suggestion that he take a higher bidder at an ostensible loss of the difference, expecting you to play stop thief, a sort of "I spy" game with the contractor, with the usual result of making for yourself, at the least, two enemies—the owner and the contractor, and of having been unable to entirely protect the owner or curb the contractor. There are some things you will require to specify which are difficult, almost impossible, to describe so that their value can be got at: stained or leaded glass for example, or an elaborate stairway or carving, and matters of that sort. My method in such cases is to put a price on them: for glass, by the foot, unless I intend very elaborate work, in which case I omit it and say so. If for a stairway, I name a lump sum, and specify whether that includes the horsing or not, and the finishing. For carving, I specify a sum of money to be allowed; or if very costly, like figure-work, omit it and say so. When a sum of money is allowed, you should state that the owner is to buy where he pleases, otherwise you may find some trouble in putting the work where it will be best done. Forms of specifications vary somewhat, but in essentials they are alike. I presume you are familiar with their general make-up; in fact, it has been a matter of some debate with me how much of this talk is threshing of old straw and an old story to you. However, I have concluded that it won't hurt you to hear again what you have already learned, and I may have said something that will help to impress upon you the instruction probably received before. The specifications begin with the recital of the general clauses. The general clauses are those which are to be observed and followed by all the trades connected with the work of the building, which call attention to requirements common to all, and are binding upon all. The first of these refers to the architect and his authority, whether he is to supervise the work or not. If so, the clause is worded thus:—"The work to be erected under his supervision, and to his approval without reference to any other person." The sentence "without reference to any other person" is an interpolation of my own; but it is a good one, as it makes you the dictator, as it were, the sole arbiter of the drawings and specifications. And while it seems to add responsibility, really lessens it, or at least simplifies it, and will rid you of a good deal of foolish and annoying interference from both contractor and owner. It is occasionally objected to, sometimes by the contractor, but not often, the contractor knowing from experience the safety that lies in a court of last resort; more often by the owner, but I think it well to insist on it. It defines the authority of the architect positively, and rids him of the annoyance of having his decisions overruled. This does not refer to any question of values necessarily (the agreement usually providing that dispute as to prices, &c., shall be decided in some other way, as by arbitration), but to matters connected with the design and the meaning and intent of the drawings and specifications, where the architect is the only person who is qualified to decide, after all. The second clause refers to the unity of the drawings and specifications, calling attention to the notes written upon the drawings as being part of the specifications, and that drawings and specifications are to be taken together and not separately. Work shown or mentioned in either to be taken as if in both. This clause is intended to insure against omissions in either of the two, and is a valuable one. The utmost care may fail to include in both what may be in one or the other. The next provision is one requiring the contractor to follow the detail drawings as the final exponents of the contract drawings, with the implied guarantee on your part that they shall show no new work or work not suggested by the contract drawings, but which insures you an opportunity to correct or improve on your design up to the last moment within the bounds of the rights of the contractor. Next, a claim of importance requires the builder to follow the figures on the drawings rather than to measure them with scale. Builders will use the 2ft. rule if they are permitted, with unfortunate results, particularly where you have worked things down in your planning to a very fine point. This same rule, generally the worse for wear, is not a safe instrument to use, particularly if your drawing is one-ninety-sixth or one-forty-eighth the full size, while the figured drawings, if properly checked, can be made exact without any possibility of doubt. The last clause of the general clauses is one requiring the contractor and all trades to comply with all city ordinances and requirements; to pay for all permits, and to hold the owner free from all penalties for infringement of ordinance, or failure to comply with the same. Some copies of specifications I have seen have more than these clauses; but I think that these embody all that apply directly to the work of the building, any other requirements belonging more particularly to the agreement. The methodical arrangement of specifications should be this: Excavation, stone-mason and cut-stone, marble, bricklayer, terracotta, mosaic floors, tiling, cement pavements, carpenter, mill-work, plumber, tinner, plasterer, galvanised iron, roofer, iron-worker, beams, &c., painter and glazier; heater, steam-work, engines, electric-work, dynamos, &c., lifts. Each trade should be complete in itself, and the specification should embody all of the work and materials required, and any work or materials to be done or supplied in connection with any other trade, as, for instance, the tinner sometimes supplies registers to sizes given by the heater contractor, which are set by the plasterer. You see these three trades require each notice that the others have to do with them. It is necessary, also, that if, for any reason, you vary the work usually done by any one trade, you shall give notice to it, that either it shall include work not generally taken, or exclude work usually taken; as, for instance, the painter I always require to furnish the glass. In some localities, the mill-man furnishes the glass for the general trade. If you wish to avoid any trouble, you must always say in the mill-work specification that he shall not furnish the glass, or omit it from the painter, and let the mill-man furnish it. You can require the plumber, if you choose, to put enamel paint on a tub or on a wall of a bathroom, or to supply casings of wood or marble for his fixtures. And the reason you do this is to avoid interference of one trade with another, and to make the plumber entirely responsible for his own work, so that he cannot plead for any breakage or spoiling of work that the carpenter, mill-man, or painter, or marble-worker did it. Now when you have done this, you must notify the painter, mill-man, carpenter, the marble-worker, that the plumber does this work, otherwise you may pay twice for it; that is, both trades may estimate on it, seeing it required on the drawings and clause No. 2 of the general clauses before them, which would be unfair to your client of course. Builders sometimes object to the grouping of work in this way, and unless the trade whose usual business it is to provide the work or material is notified in his specification, it may make confusion: notification is sufficient, however. And thus while you make the plumber provide all marble-work required, you have let the marble mason know that, and also to know where the specifications for that marble-work will be found, by your intimation in his specification. Always draw each specification, so that if the work is let separately, each man's work is in his specification complete, with nothing left for implication one way or the other. With a general contractor as the builder (one man who assumes all the work), he is, of course, responsible to you and to the owner, and work or material specified anywhere in the specifications would be held, from a legal point of view, to be his to do or furnish. But if your specifications are defective as to who of all those who contribute towards the work does each part, you can put your general contractor in a hole very easily, and he has a moral right to expect that when he gets his estimate from mason, plumber, or anyone else, that they have taken all that is required, and that there is no such ambiguity as will cause him to lose money, instead of making his legitimate profit, and in which latter case he is likely to make your existence an unpleasant one as far as your connection with that building is concerned. Your specifications must agree with the drawings. There must, of course, be no conflict between them. Each building is *sui generis*. There can be no general specifications prepared which will meet every case. There are forms of specification printed which proceed upon the idea that you shall cross out any clauses not applicable to the house for which they are intended to be used, leaving in those which are; but you are very likely, if you use them, to leave in parts which have no business to remain, and you will have specified cornices where outlookers are shown; turned posts where squares are drawn; stone heads where arches are shown, and a thousand other inaccuracies, small, perhaps, but all requiring explanation, and lessening your control of the work. In addition to this, crossing out or interpolating gives rise to question sometimes, and it may be hard to prove, from such specifications, their correctness. I have prepared some copies of the synopsis of the specifications I am accustomed to use. If you will refer to them I will go over them hastily, noting some of the more important matters, and will not further take up your time.

† A lecture delivered before the Architectural Department of the University of Pennsylvania, by Mr. T. Roney Williamson, Architect.

GENERAL WORKING SYNOPSIS OF SPECIFICATIONS.

EXCAVATION.—REFER TO GENERAL CLAUSES.

Top soil. Disposal of earth, cart it away? deposit on lot—to grade—in piles?

Depth of cellar. Depth of trenches. Inside, outside.

Width of footings. Vault. Grease-trap.

Well:—Include walling; include man-hole.

Trenches for pipes. Include digging and refilling.

Shoring of walls—adjoining. Shoring of earth banks, if necessary. Pumping of water, if any. Cleaning of old wells; filling of same.

STONEMASON.—REFER TO GENERAL CLAUSES.

Stone:—Cellar and backing: sizes, kind. Facing: sizes: kind of wall—broken-range, random-coursed, coursed.

Dressed—how? rock faced?

All on natural bed: jambs dressed, arrises cut. Specify bonding.

Footings, stone:—Depth, width, kind of stone, sizes; squared? edged?

Footings, concrete:—How mixed? Who furnishes forms? Thickness layers, ramming. What cement? What sand? What proportion of each?

Testing of cement:—For fineness—what mesh? Tensile. Compression. Boiling.

Thickness of walls:—Piers, sizes. Cellarway. Foundation for steps.

Levelling of walls:—For joists, sills, frames, heads, plates.

Leaving chaces for pipes, posts, flues.

Building in blocks, strips, frames.

Skew-backs for arches. Arches: what soffit, if necessary? cut? rough-face?

Mortar :—Any cement? what kind?

Lime, any particular kiln or make?

Sand :—Bar, road, creek, bank?

What proportions of lime, sand, and cement, if any?

Pointing :—Lime mortar. Marble dust. Cement: What kind? any sand? what style of pointing?

Anything as to bad earth foundations, rock in cellar: blast it, sledge it, plug and feather. Owner to pay per perch? owner to have?

Old walls :—Stone to be re-used, removed, contractors, owners.

Who supplies water? scaffolding, who supplies?

Cut-stone :—Pier-caps, chimney-caps, girder blocks. All sizes, kind of stone, dressed.

Ashlar: how thick? how clamped?

Sills: moulded? plain? Cut to wash, throated.

Heads: moulded? plain?

Platforms: steps, balustrades, moulded rails? turned or square balusters?

Bands: moulded? plain? left for carver?

Columns: full diameter? half diameter? fluted? left for carver?

Caps: left for carver? moulded?

Pilasters: plain? panelled? left for carver?

Cornices: size; projection; bed.

Curbing: what kind? all sizes.

All sizes, kind of stone, style of dressing.

Marble or slate treads and risers to iron stairs?

Stone-pavement :—What kind? all sizes; dressed? rough?

Any cutting for doors, man-holes, plumbers' fittings?

Remember to set sills free in middle.

Remember that fine limestones must be laid in lime-mortar, and that cement must not touch limestones in joints or backing.

Remember to require covering of all cut-stone to protect from injury while building.

Remember that some stones rust and run—look out for that.

Specify who furnishes water: contractor? owner?

Carving :—Who does it? contractor? owner?

How, by fixed sum?

Name carver, sum.

Underpinning :—How done, by the day? on contract? any particulars?

What kind of stone? Conshohocken? cement? neat? with sand, how much?

Is underpinning to be done with stone or brick?

(*To be continued.*)

CHIPS.

The partnership heretofore subsisting between E. Ludford and F. H. Tulloch, architects and surveyors, Albany Buildings, Victoria-street, Westminster, S.W., under the style of Ludford and Tulloch, has been dissolved.

The memorial stones of a Congregational church in the course of erection at Penmaenmawr were laid on Friday. Mr. Hugh Davies, Conway, is the architect, and Mr. Erasmus Jones the contractor.

Among the receiving orders in bankruptcy announced in Tuesday's *Gazette*, the name occurs of H. Stockton Judd, of Leicester, architect and surveyor; and also that of John Ward, of Morie-street, Wandsworth, described as president of the Navvies, Bricklayers' Labourers, and General Labourers' Union.

Alterations are being made to the parish hall, Teddington, embracing the ventilation, which will now be effected on the Boyle system, the latest improved form of the patent self-acting air-pump ventilator being adopted for the extraction of the vitiated air, while fresh air is admitted through their improved air-inlets.

The new opera house at Wakefield will be opened on Monday next. Mr. Frank Matcham is the architect, and Messrs. Denholm and Co. were the contractors. The whole of the moulded and modelled front has been supplied by Messrs. Fambrini and Daniels, Lincoln, in their buff concrete masonry. The above includes a series of highly decorative panels of large size, representing "Music," "The Drama," &c., with modelled medallion heads of Mendelssohn, Beethoven, Garrick, and Shakespeare.

After undergoing repairs and restoration the parish church of St. Botolph, Aldersgate, was reopened on Sunday. Nearly three thousand bodies have been removed from the vaults and building and reinterred at Woking Cemetery. In the course of excavations several discoveries were made, including a portion of a massive column of the church which formerly occupied the site of the present structure. An immense slab of unpolished greystone—weighing about 25cwt.—was found on the floor of the vault. It bears the name of a former benefactor, "Mr. Richard Chiswell, citizen and stationer," who died in 1711, and the slab has been placed in an upright position inside the church.

Building Intelligence.

Alsager.—The foundation-stone of a new church at Alsager was laid on Thursday in last week by the Lord-Lieutenant of Ireland, Lord Houghton. The church, now in course of erection, is in the parish of Barthomley, and when completed will become the church of the new parish of Alsager. The church is to be erected in the Decorated style, and will consist of a chancel and nave 26ft. wide, and north and south aisles, opening into the nave by arcades of five bays each. The church will be entered at the west end by north and south porches, both of which open into the tower, which will be surmounted by a spire. The total length of the church will be 124ft., and the width 56ft. The church will not be completed at present; but will consist of a chancel, vestries, nave, south aisle, and a portion of the north aisle, accommodation being provided for 450 persons. When completed there will be seating accommodation for 700 persons. The church is to be built of Alton stone, and the roofing will consist of Staffordshire tiles. The cost of the present section will be about £5,450. The architects are Messrs. Paley, Austin, and Paley, of Lancaster; and the contract has been placed with Mr. John Fielding, of Altrincham.

Aston.—The foundation-stone of a church institute and mission-room was laid by the Bishop of Worcester on Monday. The site has frontages to three streets, Park-street, Lynton-road, and Wainwright-street. The higher end will be occupied by a mission church and classrooms. The mission church is about 62ft. by 38ft., and will have an open-timbered roof. The girls' classroom is 24ft. by 21ft., and the infants' classroom 27ft. by 21ft. In the basement are a large kitchen, heating apparatus chamber, dressing-rooms, lavatories, &c. The design for the building is a free treatment of Gothic. The external elevations will be of brick, with moulded cornices, &c., of brick, and tracery of stone. Mr. John G. Dunn is the architect, and Mr. Thomas Johnson is the builder.

Birmingham.—Bishop Ryder's church was reopened on Saturday, after having been closed for some time for the purpose of carrying out much-needed repairs and redecoration. This church was built in 1838 from designs by the elder Rickman, and, like many similar structures built at that time, it was disfigured by deep and comfortless galleries. Nearly 20 years ago the galleries and old pulpit were cleared away with their cast-iron tracery and imitation carving grained to represent oak; the church was newly floored and reseated, and a carved-stone pulpit was erected. Last year a new chancel was added, and a carved reredos. The present work includes the replacement of the plastering of the nave ceiling by matchboarding, decorated with designs of sacred symbols and crowns, surrounded by foliated wreaths. The builder's work was carried out by Mr. John Bowen, the decorations by Mr. W. Naughtin, from full-size designs, and under the superintendence of Mr. W. H. Bidlake, architect, of Waterloo-street, Birmingham; and the figures were painted by Mr. G. T. Tarling.

Gestingthorpe.—On Thursday last, Gestingthorpe Church, Essex, which has been under repair for the last seven months, was reopened. The nave arçade, which had by the weight of the roof been thrust out of the Perpendicular to an extent of 1ft. 10in., has been taken down and rebuilt. The timber roofs of the nave and aisle, which were particularly fine, had been almost entirely concealed by plaster. These had been reframed and refixed. The chancel arch, which was filled in, has been opened out; but the fabric generally has been disturbed as little as possible. A new organ-chamber has been built at the expense of Mr. W. E. Oates, Gestingthorpe Hall. The work, which, owing to the critical condition of the building, involved considerable difficulty, was carried out by Mr. S. C. Parmenter, of Braintree, under the superintendence of Mr. A. Blomfield Jackson, architect, London.

Leeds.—An art department is being added to the Yorkshire College at Leeds, from designs by the architects of the main building, Messrs. Alfred Waterhouse and Son. The building now in progress is being erected on the north side of the textile department, and joining up to the western gable of the dyeing department. The entrance to the art department is from the Clothworkers' Court, the extension serving as a connecting-link between the textile and dyeing departments, and by the addition of a covered way to the latter, the Clothworkers' buildings will be made directly accessible to the main body of the college. On the first floor are the studio, with north light, and the design studio, which is in close proximity to the textile museum. On the second floor is private studio, and a life room, while on the ground floor is a students' common room, and a ladies' cloakroom. The rooms are lighted throughout by electricity, and arc lamps are hung in the design studio and the life room. The rooms will be ready for the actual use of the art classes at the beginning of the second term of the coming session.

Nelson, Lancs.—The technical school section of the Free Library and Technical School, which have been erected by the corporation of Nelson at a cost of about £12,000, exclusive of site, was opened on Friday. The building has its main frontage to Market-street, and will ultimately form the south wing of an extensive pile of municipal buildings. Its frontage to Market-street is 37ft., but its length is 103ft., and its height is 44ft. The public library will be accommodated in the Market-street end of the building. The structure is three stories in height; the ground and third floors have each a central corridor, with the various rooms opening into it; but on the second floor the corridor skirts the external wall, and has the three art rooms opening on to it from the right. In the library section of the building will be provided general and ladies' reading-rooms, lending and reference libraries, &c.; and in the basement is a cotton-weaving room. The elementary drawing-room and the chemical laboratory on the first-floor corridor are open to the roof.

CHIPS.

By order of the Court of Chancery the whole undertaking of the tramways in the streets of Hull is now offered for sale, the reserve being fixed at £15,000. Should a satisfactory offer not be obtained, the lines will be pulled up, and the horses, cars, stabling, and all materials disposed of. The Corporation might become the purchasers, but they do not require the horses and the present cars, as they consider electricity the future motive-power for tram-cars.

Only four years ago, the pine-bark beetle invaded the pine lands of Virginia, and the result now is that hundreds of thousands of acres of forest are killed as effectually as if it it had been done by a conflagration. Similar devastations are reported from portions of New York, New England, and the Maritime Provinces of the United States.

Mr. Benjamin Walters, of 11, St. Mary's-place, Newcastle-on-Tyne, retired timber merchant, who died on the 21st July last, has left personal estate valued for probate at £121,270.

The estimates of the Public Works Department of Victoria for 1895 contain votes for erecting and repairing bridges to the amount of £4,000 odd; jetties and harbour works £16,000 (£6,000 of which is to be devoted to the clearing the Yarra of basaltic reefs); drainage works, £4,900, £2,000 being devoted to the improvement of the Hanna-street drain, South Melbourne.

The board of guardians for Walsall are about to add a new infirmary to the workhouse at an estimated cost of £7,000. Mr. H. E. Lavender, M.S.A., of Walsall, is the architect.

The French Minister of Public Works has proposed, and the President has sanctioned, the appointment of a special commission to consider under what conditions a maritime canal between the Atlantic and the Mediterranean could be made, and what would be the probable results if it were constructed. A special commission reported twelve years ago against such a canal, and the council of the engineers of French bridges and roads have also pronounced unfavourably on the proposal.

The old Canobina Theatre at Milan, which has just been reconstructed from plans by Signor Sfondrini, was reopened under the name of the International Lyric Theatre on Sunday.

The foundation-stones of a new Wesleyan chapel have been laid at Wolstanton, near Burslem. Accommodation will be provided for 740 persons, and the estimated cost is £4,500.

Mr. George Frederick Watts, R.A., has received from the State Department at Washington an engrossed copy of the Act of Congress, accepting, on behalf of the American nation, his picture, "Love and Life," which he presented to the United States after its exhibition at the Chicago World's Fair. The picture has been placed in the Executive Mansion, Washington.

Engineering Notes.

Edinburgh.—At Monday's meeting of the Lord Provost's committee of the Edinburgh town council, Messrs. Cunningham, Blyth, and Westland, C.E., submitted plans of the proposed new North Bridge, prepared in terms of instructions from the corporation. The plans were approved, and instructions were given to advertise for offers for the work, with the view to enable the magistrates and council to exercise the option conferred upon them to cancel the agreement with the North British Company within three months of its confirmation by Parliament if from any cause they should find it impracticable to carry out the work. Mr. Robert Morham, city superintendent of works, under instructions of the committee, undertook the architectural work of the plans.

Improvements at Cardiff Station.—The contract for the erection of the new station buildings, platforms, &c., in connection with the improvements which the Great Western Railway Company are carrying out at their Cardiff station was recently let to Mr. J. Strachan, of Cardiff, the total amount being for between £29,000 and £30,000. Mr. Strachan is at present engaged in constructing the new approaches to the station under a contract previously entered into. The work of laying the metals through the new station will be carried out by the company's own men. There is now but one more contract to be let in connection with the company's extensive works at Cardiff, and that, which will be let in a few weeks' time, is for the station at the Bute Docks terminus of the riverside branch line, Clarence-road.

Wylam Bridge.—This bridge, built 60 years ago, has just been reopened after alteration and rebuilding, carried out under the direction of Messrs. J. Watt Sandeman and Moncrieff, C.E., The new superstructure, which has been placed upon the original stone piers, consists of steel-plate girders, with a decking of creosoted pitch-pine planking, 6in. thick, laid at right angles across and overhanging the main girders, whilst on the upper surface is a layer of tar concrete paving. The clear width of the roadway between the handrails has been increased from about 11ft. to 14ft. 6in. The contract for the alterations was let to the Stockton Forge, Limited, Stockton-on-Tees. Mr. George Bell, of Collingwood-street, Newcastle, acted as clerk of works during reconstruction, and the painting was intrusted to Mr. R. J. Richardson, of Saville-row, in the latter city.

Waterloo and City Railway.—Good progress is being made with the preliminary work in connection with the construction of an underground railway between Waterloo Terminus and the open space between the Poultry, Bank, and Mansion House. Piles have been driven in, and a pentagonal platform erected in the bed of the Thames, near the Surrey side, a hundred yards west of Blackfriars Bridge. The works are being carried on for a special company financed and fostered by the London and South-Western Company, under the joint engineering control of Mr. W. R. Galbraith, of the South-Western, and Mr. J. H. Greathead, who designed and constructed the City of London and Stockwell line. The principle of construction and the mode of execution will be the same as those carried out in that instance. The tunnels will be each formed of an iron ring or culvert, formed of segments bolted together by their flanges planed to smooth surfaces. Through small holes in the iron culvert cement will be blown, to form a skin on the exterior, whilst the inside will be concreted to form a smooth surface level with the inwardly projecting flanges of the segments. The diameter of the iron culvert will be greater than in the case of the Southwark line, being 12ft., increased to 12ft. 9in. at the stations. The contract for the two parallel tunnels has been let to Messrs. Mowlem and Co., of Westminster; and the caissons which will form the means of access to the borings have already been sunk under the staging at Blackfriars Bridge to a depth of over 50ft. As soon as the depth of the floors of the intended tunnels, 65ft., is attained, the four protecting shields and the mechanical excavators will be lowered into position, and the driving of the tunnels will be carried on simultaneously in both directions. As soon as the first ring of the culvert is put together, a shield is put in the front. Through a door in it the face of the heading is accessible to the miner, who picks out the central core of the rock. The shield has a projecting edge all round its periphery, which, as the shield is pushed forward by the hydraulic presses, cuts a circular hole sufficiently large for putting the iron segments together to the proper dimensions of the culvert. Wedges being inserted in the rock face between the periphery of the shield and the central core cavity, the intervening rock is broken into fragments, and falls down between the shield and the face of the heading, being shovelled up thence and sent away to the rear in skips. The geological formation through which the tunnels will be excavated will be London clay for the entire distance, except at Stamford-street, where there will be a deposit of gravel to be pierced, containing large volumes of water, which will be met by overpowering air-pressure. The line will be over 1½ miles in length, and there will be no intermediate station. The system of traction will be by electricity.

CHIPS.

Colonel J. W. Ottley, R.E., has been selected for the appointment of Inspector-General of Irrigation in India.

By the mayor's casting vote the corporation of Hertford have decided to carry out a scheme of electric lighting as recommended by their engineer.

The local board of Smethwick decided on Friday to give a piece of land in Crockett's-lane as a site for the technical schools proposed to be erected at an estimated cost of £5,500.

Recent excavations at Studfall Castle, near Lympne, on the borders of Romney Marsh, have revealed vestiges of the southern or missing wall of this Roman castrum. Enough of the old wall has been disinterred to prove that the castrum was of the usual quadriform construction.

Building operations are still vigorous in Aberdeen, and plans for buildings to cost over £15,000 were passed by the town council on Friday.

The foundation-stone has been laid of a mission church at Brynteg, in the parish of Brymbo. The church is to seat 200 persons, and will cost £1,000.

The committee of the Poole Museum have decided by a bare majority to discontinue the opening of the museum on Sundays, thus falling in with the wishes of the town council.

A Paisley joiner, named Neil M'Neil, thirty-three years of age, was killed on Friday by a fall through the joisting in a new tenement in Prince's-street, Glasgow, where he had been employed.

A stained-glass window, erected by public subscription as a memorial to the late Lord Penrhyn, was unveiled on Sunday at St. Mary's Church, Bangor. The subject is "The Nativity." Mr. Wyndham, Birmingham, was the artist, and the architectural work was carried out by Mr. Gregory, the diocesan surveyor.

A high altar has been erected in the Roman Catholic church at New House, Waterhouses, Co. Durham. It is 14th-century in style, and the altar-table, nearly a ton in weight, is cut out of a monolithic block of Carrara marble. On each side of the table is open carved work of coloured marbles, and the throne and reredos are of white Beer stone. Father Fontin, priest of the mission, designed the altar, which has been executed by Mr. A. B. Wall, of Cheltenham, and was consecrated by Bishop Wilkinson yesterday (Thursday).

A course of twelve lectures on the making of the "Earth's Crust" will be delivered by Professor Alleyne Nicholson, in the Lecture Theatre of the South Kensington Museum, commencing on Monday next. The lectures are given under a bequest from Dr. Swiney.

The Lancashire and Yorkshire Railway Company have some important works in progress at Victoria Station, Manchester. On both the western and eastern sides the approaches are being widened, in the one direction as far as Windsor Bridge, in Salford, and the other to Miles Platting. Within the station itself an entire rearrangement of the parcels department will be made.

Mr. Norman D. Macdonald, of Edinburgh, writes that the great Roman Camp at Ardock, N.B., now in excellent preservation, has been endangered by the planting out of the northern ramparts with young fir-trees, which will not only obscure the plan of the camp, but when uprooted will seriously damage the trenches. At the same time, a rabbit warren is being formed within the encampment, and the rodents will undoubtedly tend to destroy the outlines as effectually as the fir-trees themselves.

Under the will of the late Canon George Heron, of Moore Hall, £1,000 has been bequeathed for the completion of the stalls and fittings of Denstone College Chapel, and a valuable library of books has been left to be deposited at Ellesmere College.

Correspondence.

REGISTRATION OF ARCHITECTS.

To the Editor of the Building News.

Sir,—As your correspondence suggests the registration of engineers as well as architects, and since I have hitherto been called by the former name, I should like to make a few remarks and ask one or two questions, which, of course, refer to engineers and not to architects, but may be useful to those gentlemen. Except among the public not interested in engineering work, C.E. is not considered as having any value when added to a man's name beyond showing that he is not entitled to put M.I.C.E. or other letters signifying that he belongs to some engineering society. An engineer, like a poet or inventor, is born and not made by registration or subscription to an institution, and although every true engineer must admire the great help to the art and science, as well as the profession, rendered by the Institute, I have heard a full-blown member remark on seeing the letters after the name of a man who had just been appointed to a post, "Oh, he is a *mice*, then he may possibly know how to calculate the distance from the main girder to the nearest pub. if he has the assistance of a foot rule and a labourer," meaning thereby that they were not a certain guarantee of proficiency. Now, who is it that desires registration? Not the man, whether he was born a carpenter, a blacksmith, or a shop boy, who is now in consequence of his energy, talents, and inventive powers, carrying on a successful business as an engineer. T. Champneys and C. Middlewick may find an apprenticeship and registration absolutely necessary to enable them to pose as bogeymen before the awestruck public; but I do not remember how Brunel, Brunlees, Stephenson, Fairbairn, and one or two others among the unregistered got on, sufficiently to go into the matter here. Registration is not desired by the man who has formally and properly learned his business of a civil engineer engaged in actual work, and who has become M.I.C.E., &c., and who in consequence of his position, ability, knowledge, and natural engineering quality can gain the respect of all who know him. Certainly not. Who is it, then? Chiefly those who lack some or every quality which would justly entitle them to the name of engineer, but who, by the help of wealth or accident or fraud, are now carrying on a business, in which they only injure more or less the productions of the brains of their paid assistants. These try to deceive the public with C.E. after their name, and require the protection of registration to save them from infamous graves. We have seen a similar case with the registration of patent agents. The incompetent and the firms managed by unscrupulous ignoramuses are all registered and placed on an equality with the one or two able agents. The examination of the Institute is doubtless good; but we all know that a man who passes an examination in any subject is not necessarily suitable as a business and practical man, and is often troubled with such a bad memory as to have quite forgotten the subject two or years after examination. The profession, if it should be so called, is moreover now overcrowded with those who, having passed their exam., can only get any business at all by charging ridiculously low fees, and thus injuring the old-established firms—the good ones more than the bad. Let us take warning by the patent agents. If any registration is required, it should be simply a registration, without fee or examination, and all those guilty of incompetence, or who could be charged with any fraud or imposition or misrepresentation, should be prevented from practising, and liable to punishment.—I am, &c.,

Nottingham, Sept. 24. Pontifex Minimus.

BAD AIR IN THEATRES.

Sir,—May I hope that one or two of your readers have to do with theatres, either as builders, managers, or architects, and that they may turn their attention to a matter which the medical profession, through their mouthpiece, Dr. Parkes, claim to be of the utmost importance —fresh air?

The need of fresh air is a matter which *ecclesiastics*—to judge by the outcome of a correspondence on this matter a year or so ago—do not think sufficiently important to be worth their notice, and they and most theatrical managers, too, try and reproduce the Black Hole of Calcutta. Times without number have I had to leave a London theatre in a state of semi-faintness or suffocation, and until I recently visited Eastbourne, I thought that all Dr. Parkes' printed utterances were just as much thrown away upon theatres as they were upon churches. Not so. I trust those of your readers who care to verify my facts will pay a visit to Mr. Standen Triggs' theatre at Eastbourne, and closely inspect it. Last week I purposely took a seat—front row, centre stalls—for which I paid 4s. 1d., including programme, and on the night following I took a gallery seat—the worst I could think of or select—for the purpose of testing the ventilation, as well as the view I could get of the stage. There was no difference whatever, and I was enabled on each occasion to sit through the whole performance and inhale fresh air. Now, if Mr. Triggs can give me 4s. worth of unmixed pleasure, why do all the London theatres appear to vie with one another in giving me 10s. 6d. worth of suffocation, and little or no view of the stage *as well?* I like to take a gallery seat.—I am, &c., H. J. Cunliffe, M.A. Oxon.

New University Club, London.

Intercommunication.

QUESTIONS.

[11219.]—**Income-Tax.**—I have lately taken to a small builder's business, a going concern, and last year I was assessed at more income-tax than I think I ought to have paid. This year I intend to appeal, but do not know how to go to work, being young, and a new hand. Can you briefly inform me the form of balance-sheet I shall have to produce, showing condition of business? I may say this year business has fallen off very much, and in many cases I have to give very long credit, as this has been the previous custom. My great difficulty is, in what form to prepare myself so as to be able to convince the commissioners I am entitled to a reduction of the tax. How can I show an allowance on debts which very likely, in due course, may never be paid at all?—B. J. Broad.

[11220.]—**Electric Lighting.**—Will some reader experienced in electric lighting recommend a concise handbook suitable for the general requirements of an architect?—Architect.

REPLIES.

[11213.]—**Tall Mill Chimneys.**—The best book is "Tall Chimney Construction," by R. M. and F. J. Bancroft.—H. L.

[11216.]—**Flat Roof of Concrete.**—"Enquirer" will not be able to construct a flat of 35ft. span without using girders. He should make the concrete much thicker than 6in., and arrange a good thickness over the top of the girders. With good materials there should be no cracks.—H. L.

[11216.]—**Flat Roof of Concrete.**—It is almost impossible to make a watertight concrete roof, except it be of very small dimensions—not by reason of any difficulty with the concrete itself, but, in common with other materials, it is subject to expansion and contraction with change of temperature, and, unlike some other substances, it will not yield to this change of form without giving evidence thereof in the form of cracks which admit moisture and rainfall. Under any circumstances lengthened experience is necessary to construct a concrete roof of considerable span which shall be watertight and satisfactory in other ways, and it should always be asphalted. The correct quantity of bullock's blood to mix with cement to give it the desired tint is best arrived at by trying it in various proportions before doing any actual work with it.—Thomas Potter, 39, Victoria-street.

A stained-glass window has been erected in the parish church, Wigan, to the joint memory of the Hon. Sir James Lindsay, and of his wife, Lady Sarah Lindsay. It consists of four figures, representing Mercy and Truth, Righteousness and Peace. Messrs. Heaton, Butler, and Bayne were the designers.

The Redruth local board are inviting tenders for the construction of a large storage reservoir, certain intake works at Lower Penstruthal and Gordon, and the supply, laying, and jointing of about ten miles 178 yards of 6in., 5in., 4in., and 3in. cast-iron socket-pipes with their appendages, for the water supply of the town of Redruth. The engineer is Mr. H. Bertram Nichols, Assoc.M.Inst.C.E., of Corporation-street, Birmingham.

The corporation of Sheffield are about to make their first venture as builders of artisans' dwellings. In carrying out the widening of Eyre-street, it is necessary to demolish twenty-three houses, most of them back-to-back dwellings. The Local Government Board, in their provisional order sanctioning the scheme, make it a condition that the corporation erect other workmen's dwellings in place of those pulled down. The corporation have accordingly offered contracts for the erection of seven dwellings on land belonging to them, situate about 200 yards from those to be pulled down, and they will be of a modern character.

Legal.

HABITABLE ROOMS.

Local authorities show a disposition to apply their building by-laws with increasing stringency, and in the public interest this is satisfactory. A recent case from Coventry, reported in our issue of last week (Sept. 21), shows how easily important questions may arise over matters apparently trifling. It appears that a builder was summoned by the local authority for breach of the building by-laws, in having built a habitable room in a domestic dwelling which was not 9ft. high from floor to ceiling, as therely required. He had sent in his plans, which were ultimately approved; but when the surveyor went over the house, upon receiving the usual notice that it was fit for occupation, he found the room in question had been built at the back on the top floor, although it was not in the plan. The room was 14ft. 3in. long by 12ft. 6in. wide, and at its highest point it was 9ft., but for more than half its area much lower. It contained an ordinary window, but no fireplace. There were no means of ventilation, and the surveyor did not consider it was fit for habitation.

It was argued for the builder that he had only intended it to be used as a box-room, and not in anyway as a sleeping apartment. But, on the other hand, the local authority urged that it was built in such a way that a bed could be, and doubtless would be, placed in it, and so that it was a "habitable" room within the meaning of the bylaw. The builder's advocate was, in fact, ultimately driven to argue that, as the room was not intended to be lived in, if the owner or occupier of the house should afterwards chose to use it for that purpose, it would be the duty of the local authorities to give him notice and have it closed. This, however, seems to be quite beside the point. The object of the bylaws is to prevent the building of "habitable" rooms in such a way as that they shall not be fit for habitation. The time for the local power to interfere is when the house is building, and it would be practically impossible for them to do so when it is subsequently occupied. The magistrates held that this room should have been shown in the plan, and that as it was a habitable room which did not comply with the bylaws as to centre space, the offence had been proved, and the builder was fined accordingly.

Fred. Wetherfield, Solicitor.

1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

Builder.—Foundations.—Support.—(1) You can only do this safely by providing for the support of his wall. (2) Probably he has acquired a right to the support of your adjoining building. (3) By serving the usual party-wall notice. But it does not seem that this is a party-wall.

WATER SUPPLY AND SANITARY MATTERS.

Shipley Drainage and Sewage Disposal.—At a meeting of the Shipley Local Board, held on Sept. 25th, it was resolved: "That application be made to the Local Government Board for their sanction to the borrowing, at interest, upon the security of the rates of the district, of the sum of £55,000, in addition to all other sums heretofore sanctioned for these purposes." This amount is required for the main drainage and disposal of the sewage and nightsoil of the district. The plans for the main outfall sewers for the whole district, as well as the treatment of the sewage, have been prepared by Mr. Malcolm Paterson, M.Inst.C.E., of Bradford, and those for the subsidiary drainage of Windhill (recently annexed to the Shipley district) by Messrs. W. B. Woodhead and Son, C.E., of Bradford. The sum mentioned in the resolution includes the provision of means of dealing with the nightsoil of the district.

An organ originally built by Messrs. Lewis and Co., of London, is being enlarged and rebuilt for erection in Jesmond parish church by Messrs. Blackett and Howden, of Newcastle-on-Tyne.

Surveying for the railway, to connect Lynton and Parracombe with the remainder of the world, has commenced. From Blackmore Gate the route creeps down the hillsides to cross the valley near Highly, and from thence near the Old Church to Martinhoe Common. Most of the land has been already promised, and the fund for preliminary expenses has been raised.

Our Office Table.

At Tuesday's meeting of the City Commission of Sewers, Mr. Morton, M.P., inquired as to the charges made by a district surveyor in the City named Power, and whether the fees had been received. The surveyor, he said, had made demands for fees of two guineas each from numbers of shopkeepers in the City because he had chosen to construe everything hanging from a shop-front as a "sky-sign" within the meaning of the recent Act, by which sky-signs had to be licensed. Mr. Blake, the clerk to the Commission, said no fees had been returned by Mr. Power as far as he could ascertain. Some persons had taken proceedings against Mr. Power to recover the money paid, and had obtained judgment, but had failed to get any further satisfaction.

The largest log of mahogany ever imported into the United States was received a fortnight since at Messrs. Nesmith Brothers' mahogany and cedar yard, Greenpoint, N.Y., on the schooner *Laguna*, of Port Jefferson, N.Y. The log, measuring 44ft. 4in. long, 60in. by 56in. at the base, and weighing 21·66 tons, was felled in the Sierra Chisee, in Gautemala, and floated down the Rio de la Pasion and Rio Usumucanto to Laguna, Mexico, a distance of over 300 miles. It was to have been sent to the World's Fair at Chicago, but all vessels refused to carry it. After lying at Laguna over a year, the log was sawed in two, and Captain S. S. Bayles took it aboard his vessel and conveyed it to New York. Even now the block measures in the clear 22ft. 6in. long, 5ft. wide, by 4ft. 8in. deep.

The Canadian Parliament has just passed an Act providing for the inspection of electricity meters. This Act allows consumers, whenever they are dissatisfied with the action or tests of the electric light contractors, to have their wires and fittings tested by an electric-light inspector, upon application to the Inland Revenue Department, which has charge of the inspection under the Act. The Act also settles a question upon which there was formerly no written law, in providing that any persons discovered maliciously or fraudulently abstracting, or causing to be wasted or diverted, any electricity, shall be dealt with as guilty of theft, and punished accordingly.

CHIPS.

The Duchess of Devonshire laid on Wednesday the memorial-stone of a new church at Eastbourne. The church, which will be called St. Peter's, and will replace the existing church of that name, is being erected on a site opposite Compton-place, the ground, as well as a sum of £5,000 towards the building fund, having been given by the Duke of Devonshire.

A new Congregational church, which has been erected at Stroud-green at a cost of over £10,000, was opened on Wednesday. It is built of stone, and seats 900 persons.

The Ayr Harbour trustees have resolved to rebuild the wall on the south side of the harbour at a cost of £21,000.

The memorial stone of the new Burgh Buildings of Whiteinch, near Glasgow, was laid on Tuesday. The buildings have frontages to George-street and Whiteinch Park. Contained in the block there are a police establishment and fire station.

Gold and silver medals have been awarded at the Autwerp Exhibition to Messrs. Harry Hems and Sons, ecclesiastical art workers, of Exeter.

The first ordinary meeting of the Liverpool Architectural Society for the present season will be held on Monday week, October 8, at 6.30 p.m., when the president will deliver his opening address, and introduce the new professor of architecture (Mr. F. M. Simpson) to the society.

The Earl of Derby opened on Wednesday a new technical school and free library at Leigh, Lancashire, which has been erected at a cost of £13,000.

The Weybridge Schools, Weybridge, Surrey, are being warmed and ventilated by means of Shorland's patent Manchester stoves, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

A special meeting of the Llanelly harbour board was held last week to consider the advisability of continuing the line of training banks westward towards Burry Port, in accordance with the recommendations of the consulting engineer, Sir Alexander Rendel. After an exhaustive discussion it was decided to proceed with the work.

AND ENGINEERING JOURNAL.
VOL. LXVII.—No. 2074.

FRIDAY, OCTOBER 5, 1894.

A NEGLECTED RESOURCE.

DID anybody ever meet with a photographer who did not think himself quite fit to photograph any building, old or new? Probably not. But if such unheard-of diffidence could affect the possessor of a camera and a lens, the person who owned to it would thereby suggest that he was far above the average of his tribe in architectural knowledge. In portrait photography, even the Bank Holiday practitioner who plies his trade on Hampstead Heath or Kew Green would admit that some training is necessary. He would not like to "take" his customers from any point or in any attitude. Nor would they like to be so taken. Their remonstrances would perhaps be more forcible than polite, and their mildest measure would be to return his goods upon his hands. But when it comes to the case of a church or a house, the matter is altogether different. Here a photograph is a photograph, and whether it is good, bad, or indifferent, must be paid for. Indeed the ordinary photographer (and, of course, we except from these remarks the few men of taste and artistic training to whom we architects owe so much) does not recognise that one photograph of a building is better or worse than another, except in the technical matters which he understands. If, for instance, the negative was under-exposed or over-exposed, or the lens out of focus, he knows this to be wrong. But if the building is taken from a bad point of view instead of a good one; if its best details are in deep shadow and its poorest ones in bright sunshine, it matters nothing to him. He does not admit it, for he does not see it; his print is free from technical faults, therefore, he is content with it, and cannot tell why everyone else should not be so likewise.

The exceptional photographer, the man who knows how his subject groups best, and what sort of light it requires, too often disappoints the architect in another way. He spends his life apparently in doing the same stock subjects over and over again. Like Mr. Pecksniff, he gives us Salisbury Cathedral from the east, Salisbury Cathedral from the west, Salisbury Cathedral from the north-east, and Salisbury Cathedral from the south-east. Then he goes on to Lichfield Cathedral, and Norwich Cathedral, and all the rest of the cathedrals, and repeats the process. After he has done the cathedrals he takes up the abbeys. Tintern, in particular, he cannot leave alone for a year. He gives us plenty of ivy, and not much architecture, and the more familiar everybody is with a building, the harder he works at photographing and re-photographing it. This may suit the public; in all probability it is done just because it *does* suit the public. But it is not by any means the kind of thing that suits architects. For their purposes there are enough general views of cathedrals already. They want models of a different class, and even in the class of church-building they want models that are less ambitious and more suggestive. Therefore photographers, as a rule, fail to do more than a fraction of the good they might do to the architectural student, and in his education, photography is, to a great extent, a neglected resource.

There are, it is true, photographs of interesting and little known buildings to be met with. Here and there, in out-of-the-way places, some scarcely-heard-of practitioner, with very modest appliances, takes views of noted works in his own locality. It may happen that these views are satisfactory—for natural perception sometimes goes far to supply the want of training—and artistic taste is not always on the side of the largest camera. And even if the views are poor, they are worth buying when no better ones can be had. At worst they will indicate whether a building is worthy or unworthy of a visit, at least, for those parts of it which the picture represents. And when it has been visited they will be no less valuable. Different students carry away with them different memories from the same architectural work. One remembers best, perhaps, the construction; another, the plan; a third, the mouldings; and a fourth, the tracery or the carving. And it is one of the marks of a satisfactory design, that everybody thinks he can never forget it. It looks so simple, so natural, so impossible to have been treated otherwise than it has been, that we feel it the easiest thing in the world to recollect it from beginning to end. This is how art conceals art. Try to sketch it a month after, and see how many difficulties suggest themselves—difficulties so perfectly conquered in the design that one never noticed they had been there. This is where a photograph, even the worst of photographs, becomes helpful. It may be dark where it ought to be light—it may crowd the building together and make a jumble of its best features; but still such facts as it records can be depended on, and there are often enough of them to answer the questions that arise when the student has left the place and tries to recall the scheme in its entirety.

The unfortunate thing is that photographs such as these are hard to meet with. They are seldom to be bought in London. They must be picked up in their own localities. This means that it takes years to collect them. Half-a-dozen are to be met with here, half-a-score there. In some country town you look through portfolios of cathedrals and abbeys and find, perhaps, one view of some old house or village church which you never saw or heard of. You carry off your prize as does the botanist who comes on a rare flower, or the coleopterist who finds a new beetle, and you leave the young lady in the shop wondering that anybody should prefer such a humble subject to a print of the west front of the local minster. With Continental architecture the case is even worse than with our own. Laurent, of Madrid, has indeed produced a magnificent series of works in Spain; and if England could but afford from £80 to £100, the money would be well laid out in buying the complete set for one of our chief public libraries. This, however, may be too extravagant a proposal, and we must be content with the few specimens of M. Laurent's views which alone exist, or did for years exist, in the Art Library at Kensington. For France we know of no single series comparable with his. For a long while only the French cathedrals seem to have been thought worth photographing; and none but the best known of these were represented in London. The earlier collections, in fact, were almost confined to buildings in Normandy. Now it is possible, even in England, to get views in Poitiers, Arles, Nismes, and elsewhere in the south. The larger Renaissance examples, too, have been dealt with; and, on the whole, France is almost as well treated by the architectural photographer as England. Italy sends an abundance of photographs from Rome. The unsatisfactory front of Milan Cathedral finds many buyers, for Milan is the biggest cathedral in the world, and popular taste in England, as in America, always thinks the biggest must be the best. Venice, too, is fully illustrated. People go there, and like to show their friends where they have been. But the great Mediæval and Early Renaissance buildings in Italy do not seem to be thought worth notice. It is a rarity to see any views of them, except, perhaps, the Certosa at Pavia, and two or three west fronts like that of Siena. One very small photograph of the Campanile at Amalfi, beloved of painters, is all that it seems possible to obtain in England of that locality; while of Bari, Trani, Molfetta, and the other towns in the lower part of the peninsula not a trace is to be seen.

Belgian Hôtels de Ville can be had without difficulty. Belgian churches, with the exception of Antwerp, are rather harder to meet with. Domestic buildings in Bruges seem to have attracted the photographer, who has yet a great deal to do in illustrating other towns. Holland has now been photographed in parts, but not always wisely. Much that has been brought thence was scarcely worth bringing, and a great deal that remains behind would be very valuable to us. Germany seems to be unfortunate in its photographers. They send us representations enough of the lifeless and mechanical buildings of Berlin, which look as if they had been turned out by an architectural drill-sergeant, and neglect places like Hildesheim, Stendal, and even Nuremberg. Cologne Cathedral, as completed, of course suits their taste; but the older churches in that city, and the smaller ones in the Rhine district, are passed over with contempt. This, in fact, is the fate of small churches everywhere: and yet, for the few architects who still have any concern with church work, it is the small and not the large ones which have usually most to teach.

This is a general outline of what photography, so far, has done for architecture. Could we expect it, unsought, to do much more? People who publish photographs do it as a matter of business. Their customers are the public, not chiefly the profession, and they order what their customers will pay for. If architects want other subjects, they must take them or have them taken. Why should they not be their own photographers, and exchange specimens, as botanical and geological collectors do? The specimens would not, by any means, be all of general views. They would include details of every period and of every description. They might come, not only from England, Scotland, and Ireland, but from the Continent, and even, if opportunity offered, from more distant regions. The sizes might be very moderate, and the photographing would certainly not do away with the drawing and measuring of interesting work. On the contrary, it would facilitate it. Dimensions, sections of mouldings, and enlarged sketches of detail would still be noted down by hand; the photograph would be supplementary to them—a record of the actual effect of the work as built. Now that cameras are so plentiful, and amateur photographers so numerous, it would surely be easy to start a small society of those amongst them who are interested in architecture, and to arrange for the exchange of prints. The printing might have to be handed over to someone experienced in its technicalities; but the cost, divided amongst some scores of members, would be small, and the results, in all probability, very valuable.

THE NEW LONDON BUILDING ACT.—II.

WE now take up in more detail those sections of the new London Building Act which refer to "Lines of Building Frontage," Part III.; "Open Spaces about Buildings and Height of Buildings," Part V.; and the "Construction of Buildings," Part VI., in all three of which important alterations have been made. The numbering of the sections widely differs from those of the Draft Bill, which makes it laborious to compare the clauses. We have already given a brief *résumé* of these parts of the Act. It will be noticed that the old restrictions are re-enacted in Part II., as to the formation and widening of streets. The setting-back clauses of the London County Council's General Powers Act, 1890, are retained, the effect of which is that it will be impossible after the Act comes into operation for anyone to erect a building at a less distance than the "prescribed distance" (which is 20ft. and 10ft. respectively for carriage and foot traffic) from the centre of roadway (being a highway) without consent in writing of the Council, though should they think it expedient, they may consent to the erection or extension of any building, forecourt, or space at a less distance, subject to certain conditions as they may think proper to sanction. Section 16 provides that buildings may be erected at less than the prescribed distance from centre of ways (not being highways) as may have been sanctioned, under certain conditions; but the way shall not become a highway unless certain conditions are complied with, which are set forth in this section. By this provision it will be impossible for the owners of any estate to convert any road into a highway unless they serve a written notice upon the Council setting forth their proposal, when the Council may within two months serve a notice upon the owners or builder of the building or forecourt, fence or boundary, requiring him to set back the same or any part thereof to the prescribed distance from centre of roadway, or at such distance as the Council or Tribunal of Appeal has sanctioned. Those areas that may have been occupied by any building at any time within two years before the 22nd of July, 1878, are exempted from this restriction, or any building or extension that was going on at that date within such area. Sanction is also given by the Council to the erection of any new building at a less distance for a limited time, and subject to times and conditions as they think proper. The previous Bill contained a clause that empowered the Council to set back buildings in any new street formed after the passing of the Act distant more than two miles from St. Paul's, so as to leave a space of 5ft. beyond the width of roadway, and if the premises are used as shops, such space to be given to the public. This was judicious; but property owners could not see their way to so generous a concession. But practically sec. 26 meets the case to some extent.

As to the lines of building frontage, sec. 75 of the Act of 1862, 25 and 26 Vict., has not been repealed, and is unaltered in wording. Its purport is that no building shall be erected without consent of Council beyond the general line of buildings in any street, place, or row, in case the distance of buildings from the highway does not exceed 50ft., or within 50ft. from the highway when the line of buildings therefrom amounts to or exceeds 50ft., notwithstanding gardens or vacant spaces between the building line and highway. This rule has been often relaxed on trivial pretences. Buildings erected upon land previously occupied by buildings at any time within seven years of the commencement of the Act are exempted. Sect. 23 also repeats with slight verbal alteration section 74 of the old Act, which is to the effect that in case any building which projects in any part beyond the general line of frontage shall be taken down to an extent exceeding one-half cubically measured, or shall be destroyed by fire, &c., the Council can require any new building on its site to be set back to a line they shall direct. Compensation is to be made to the owner for any damage and expenses which he may sustain and incur, the amount, if not agreed, to be recovered in a summary manner. When the amount exceeds £50, it shall be settled by arbitration under the Lands Clauses Acts. The next section (24) provides that the superintending architect, within 14 days after defining the general line, is to serve notices on the local authority, the owner of building or land, and on the owner of houses in the same block or row "within a distance not exceeding 50 yards on either side of the building or land," or where there is no such block upon owner of adjoining lands on either side. This clause defines a distance which the present section (28) does not. The local authority or person aggrieved by the certificate of the architect may appeal to the Tribunal of Appeal. Very necessary conditions are attached (sec. 26) to the consent given to buildings beyond the general line—namely, that land in front of the advanced building shall be dedicated to and left for open public use, and that the building shall be used only for such purposes as may be specified in the consent, &c. The consent thus given (27) is not to affect the rest of general line existing. In all cases the architect may by request determine in what street or streets a building is situate, though the certificate may be appealed against.

These sections are largely on the lines of the old ones, but their amendment will facilitate the action of the authorities. The next, Part IV., on the "Naming and Numbering of Streets," is hardly of sufficient interest to detain us. The rules appear to be sensible; no name is to be given to any street without notice to the Council, who may object to it within one month—a very useful rule that will avoid much confusion.

Part V., on "Open Spaces about Buildings, and Height of Buildings," is so important, that we desire to give a more careful *résumé* of the sections. Sect. 39 defines "domestic building" as not including any buildings used or constructed or adapted to be used wholly or principally as offices or counting-houses. In the definitions of the new Act, the expression includes "a dwelling-house and any other building not being a public building, or of the warehouse class." Under section 39, and for the purposes of this part of the Act, the above further distinction is made—certainly rather bewildering, though the framers of the Act had in view that large class of buildings in London used or adapted for offices. We think, however, this further definition should have appeared in sec. 5. Sec. 40 makes it obvious why a further distinction is made. This section is intended to prevent the erection of buildings with basements intended for habitation that are imperfectly lighted and ventilated. Under the existing Acts it is possible to erect houses with basements unfitted for habitation. There are three sections of the old Act—section 96, referring to underground rooms used as dwellings, for which an open area and other conditions are required; sec. 29, of 18 and 19 Vict., requiring an open space of at least 100sq.ft. in the rear, unless all the rooms can be lighted from a street or alley adjoining; and Sec. 14, of 45 Vict., which provides that every new building intended as a dwelling-house should have attached in the rear an open space of specified area, according to frontage. These sections scarcely meet the case, and do not specifically provide for basements. The new section 40, which practically follows the L.C.C. amendment, but unfortunately reduces the 150sq.ft. to 100ft., as proposed by the R.I.B.A., provides that every habitable basement in a new domestic building shall have an area in the rear, and exclusively belonging thereto, of not less than 100sq.ft. free from any erection thereon above the level of adjoining pavement. This open space need not necessarily adjoin the rear boundary, so it may be inferred that the space may adjoin the side of the premises, as intended by section 29 of the old Act. With respect to domestic buildings abutting upon a street erected after the Act comes into force, an area of not less than 150sq.ft. is to be provided in the rear exclusively belonging to such building (see section 41), and extending the whole width of building, and to a depth of at least 10ft. Where there is a basement lighted and ventilated as above, or where there is no basement, but the ground story is not constructed or adapted to be inhabited, the open space may be provided above the level of ground floor ceiling, or a level of 16ft. exclusive of lantern lights from level of pavement, thus allowing shop premises to be extended backward into the area. In other cases the only erections permitted above this level are a closet and receptacle for ashes and inclosing walls, none of which are to exceed 9ft. in height.

We may now refer more particularly to the enactment respecting the height of such buildings in relation to the space in the rear given in sub-section iii. of the same section. The *modus operandi* as explained in several sub-clauses is not so explicitly worded as one would have liked. The mode of drawing the horizontal line is expressed rather clumsily, and we think that a diagram as given in a former Draft Bill would have assisted greatly to make the matter better understood. We gave last week the gist of the Act, and the angle at which the second or diagonal line has to be drawn to the horizontal line—namely, 63½°—meeting the latter where it intersects the boundary of the space farthest removed from the roadway; really, the angle would be at the extreme point of the rear boundary. An angle of 63½° is an awkward one to remember (why not one of 60°?), and will permit of the erection of houses to a greater height than is desirable for air and light. The objections raised to the former proposed angle of 45° by owners and interested parties, that it prevented the erection of houses of sufficient height, were no doubt formidable. Those of our readers who have followed the amendments made by the London County Council to their Bill on Part IV. of that Bill see that more can be urged on the other side. Originally the 45° angle was to apply to old as well as new streets; but by the amendment subsequently made it was to be confined to a street or way formed after the commencement of the Act (31, A, of the Bill). The effect of this alteration is that those areas most in need of light and air in the older parts of London will not be benefited. The new Act by the angle of 63·5° and the sub-section (*e*), which provides that "no part of the building shall extend above the diagonal line, except chimneys, dormers, gables, turrets, or other architectural ornaments aggregating in all to not more than one-third of the width of the rear elevation, &c.," will improve the condition of things very little, especially as it will allow a gable to be built in the back wall, which will practically shut out still more light.

There are several sub-sections dealing with exceptional cases. With respect to levels and boundaries, sub-section (*f*) defines certain points. If the pavement in front of building is not on one level, the mean level is to be taken for the "horizontal line," and where the rear boundary is not parallel with the building, this line is to be "drawn to a point distant from such rear wall the mean distance from such wall of the boundary of the space at the rear, whether such point be beyond the said boundary or not"; (*g*) when the boundary in rear is very irregular in shape, and a doubt thereby arises, the applicant may appeal to the tribunal; when the land at the rear abuts upon a street (*h*), or on an open public space, the diagonal may be drawn at the centre of roadway, at the surface level, or at the further boundary of the open space, and it shall not be necessary to provide any open space at the rear of building.

As to a corner building abutting on two streets (iv.), and secondly, abutting on one side upon a street, and another side upon an open space not less than 40ft. wide, the Council may "permit the erection of buildings not exceeding 30ft. in height upon such part of the space in the rear as they may think fit," provided the building be placed so as not to interfere unduly with the access of light and air to other buildings. The applicant may appeal to the Tribunal should the Council refuse permission. Again (v.), nothing as to determination of height by the diagonal line is to prevent the return front of corner buildings being carried up to the full height of the front for a distance of 40ft. or less. The Council may allow other modifications in exceptional cases. As to new domestic buildings abutting on old streets laid out before the Act, the provisions of this section are to apply; but the horizontal line is to be drawn at a level of 16ft. above level of adjoining pavement, and (except in the case of dwellings inhabited by the working class) the open space to be provided, as previously stated, may be arranged above the level of the ceiling of the ground story, or above a level of 16ft. from the adjoining pavement. It is, however, enacted as to any domestic building erected in such a street, that any part of the same may extend above the diagonal line, provided that the Council or Tribunal shall be satisfied that an open cubic space of air is provided in the rear equal to that which would have been provided if such diagonal had been drawn. Other clauses provide for open space about certain buildings for working classes not abutting on a street. A very important section is 43, which provides, when a domestic building (not one for the working class) abuts upon a street on the site of old ones existing at the commencement of this Act, or on a site occupied by a building within seven years previously, that the person who erects a new domestic building shall cause to be prepared plans of the previously existing building in its several parts, or "in the event of such building having been taken down before the commencement of this Act, or, having been accidentally destroyed, the best plans available," such plans to be submitted to the district surveyor, who shall, if satisfied, certify the same, and such certificate is to be conclusive evidence of their correctness. No more land is to be occupied by the newly-erected building than was occupied previously. Another important enactment, a vital addition to the old Act, is that of sec. 45, which refers to courts within a building for purposes of light and air; but why should the section only apply to domestic buildings, and not to large city blocks of offices, &c.? We gave the purport of this section last week. Briefly, wherever such a court exists, and wherever its depth from eaves or top of parapet to ceiling of ground floor exceeds the length or breadth of such court, ventilation is to be made and maintained by means of a "communication between the lower end of the court and the open air." Not a very clearly-worded clause, for it does not say what kind of communication. Will a tube or trunk answer, carried through the rooms or floor of one block inclosing the court? Then it enacts that no habitable room, not having a window directly opening into the external air otherwise than into a court, shall be constructed, unless the width of such court (measured from the window to the opposite wall) shall be equal to half the height measured from the sill of such window to the top of opposite wall—*i.e.*, a width or space opposite the window must be allowed that will make an angle from the sill to top of court of about 63½°. The diagonal of a double square would represent this angle. But a court of which the greater dimension does not exceed twice the less dimension is to be held to comply, if a square court of the same area would comply. By sect. 46 the superintendent is to determine which is the "front" and which the "rear" of a building, but appeal to the Tribunal can be made. We have already noticed the effect of clause 47, which limits the height of buildings, other than churches and chapels, to 80ft., exclusive of two stories in the roof and architectural features. This restriction is considerably modified by subsequent clauses, which allow buildings in blocks or rows erected before the Act to be carried to the height intended, and the Council may give consent to a greater height than that prescribed under certain conditions (sec. 48), such as that consent is not to be acted on within 21 days after such publication or service. Again, section 49 enacts that no existing building, other than a church or chapel, on side of a street formed after the 7th day of August, 1862, and of less width than 50ft., shall be raised without consent of Council, and no new building be erected on side of any such street so that the height of such building shall exceed the distance of the front or nearest external wall from the opposite side, the term "height" being taken to be from the level of footway to the top of parapet, or external wall or base of gable. In corner plots the height is to be regulated by the wider of such streets so far as it abuts upon it. Section 50 allows the increase of height of topmost stories so far as to bring them in agreement with provisions for habitable rooms.

The next Part, VI., dealing with "Construction of Buildings," has been considerably improved and revised. The structure and thickness of walls have been brought up to the standard adopted in many towns under the Public Health Act. Parts I. and II. of the schedule apply to walls of brick or of stone, or other hard and incombustible substances. Walls not built of brick, stone, or other hard substance, laid on horizontal beds, shall be one-third greater than the thickness prescribed. Hollow walls are to be constructed so that there shall be on one side of the hollow space a wall of the full thickness prescribed. The schedules of thicknesses appear no longer in tabular form, but are verbally expressed in separate clauses. The arrangement, too, is different: the walls of least height and length come first, and the schedule begins by reference to walls—not of the warehouse class—which do not exceed 25ft. in height and 30ft. in length, and ends with walls which exceed 100ft. but do not exceed 120ft. in height, and exceed 45ft. in length. These thicknesses follow pretty nearly the old schedules, but have been more clearly arranged. Thus we read (1) "When the wall does not exceed 25ft. in height, its thickness shall be as follows:—If the wall does not exceed 30ft. in length, and does not comprise more than two stories, it shall be 8½in. thick for its whole height; if the wall exceeds 30ft. in length, or comprises more than two stories, it shall be 13in. thick below the topmost story, and 8½in. thick for the rest of its height." (2) "When the wall exceeds 25ft., but does not exceed 40ft. in height, up to 35ft. in length, it shall be 13in. thick below topmost story, and 8½in. for rest of its height. If the wall exceeds 35ft. in length it shall be 17½in. thick for the height of one story, then 13in. thick for the rest of its height below topmost story, and 8½in. thick for the rest of its height," which practically is the same as the present schedule. (3) "When the wall exceeds 40ft., but does not exceed 50ft. in height, when the length does not exceed 30ft., it shall be 17½in. thick for the height of one story, then 13in. thick for the rest of its height below the topmost story, and 8½in. for the rest of its height." Comparing this with the old schedule, we find that there is an increased thickness for walls up to 30ft. long, and below the topmost story of 4½in.; for length of wall up to 45ft., two stories are to be 17½in. instead of only one, and the rest 13in. instead of 8½in. thick. But we leave the schedules for the present, and proceed with the rules as to recesses and openings, sec. 54. As to external walls, the rules are the same as now; and as to recesses in party-walls, it is provided that an arch of two rings of brickwork is to be turned of the full depth of recess on every story, except in the case of recesses formed for lifts; but corbelling in brick or stone may be used instead of arching for recesses 5in. in depth. As now, the area of recesses taken together is not to exceed one-half of the whole area of the wall of story, and they are not to come within 13½in. of the inner face of external wall. A new sub-clause prohibits an opening in any party-wall except in accordance with the provisions of this Act, and the superintending architect may consent to any modification of the requirements of this section. As to timber in external walls, we find an alteration of some import as to loophole frames and frames of doors and windows has been made. In the existing Act, loophole frames are to be fixed within 1½in. of the face of any external wall; but the new Act allows them to be fixed flush with the face of the wall. All other woodwork, except breastsummers and story-posts and frames of doors and windows of shops on the ground story, are to be set back 4in. at the least from the external face of the wall. The Council may exempt oak, teak, or other wood from this provision. Breastsummers of metal as well as wood are mentioned (sec. 56). An additional clause provides in the new Act that the district surveyor shall have power to require other story-posts, iron columns, stanchions, or piers or corbels, as may be necessary to carry the superstructure. Sub-clause 2 provides at the end of every metallic breastsummer a space equal to ¼in. for every 10ft., to allow for expansion. Corbels or templets of stone, iron, or vitrified stoneware may be tailed into the wall to a distance of 8½in., to support timber not permitted to bear on a party-wall—a useful addition.

The rules as to height of party-walls above roof have been remodelled. There was no thickness prescribed for party-walls of the warehouse class above roof, nor was an adequate height defined. They are now to be carried up of a thickness equal to that of the topmost story, and in other buildings, of 8½in. above roof of flat or gutter of the highest building adjoining, to such a height as will give a distance in a building of the warehouse class exceeding 30ft. in height of at least 3ft., and in any other building of 15in. measured at right angles to the slope of roof. The same wall to be carried up above any turret, dormer, lantern, or other erection of combustible materials within 4ft. from such party-wall, and extend at least 12in. higher and wider on each side thereof.

Section 61 relates to the construction of roofs. An exception is made for wooden cornices and barge-boards, to dormers not exceeding 12in. in depth, as well as to doors, frames, window-frames, in connection to the coverings. One important addition is that every building exceeding 30ft. in height, used wholly or in part as a dwelling-house or factory, and having a parapet, is, under the new Act, to have a dormer window or door opening on to the roof, or a trap door with a fixed or hinged step-ladder leading to roof, or other means of access. No more than two stories are to be constructed in the roof of any domestic building (62), and if the floor of any story is above 60ft. from street level, the story is to be of fire-resisting materials. By section 63, means of escape from the top of new buildings exceeding 60ft. in height is provided whenever the upper surface of floor is above 60ft. from street level—a very necessary precaution. The rules as to chimneys (64) have been revised literally, and in several details. Under the old Act, chimneys and flues having doors of 6in. square may be built at any angle; all others had to be constructed of an obtuseness of not less than 130°. Under the new Act, soot doors of not less than 40sq.in. are required; in no other case is a flue to be inclined at a less angle than 45° to the horizon. Several other important clauses are introduced, as subsections vi. and vii., the latter requiring the position and course of every flue to be outlined externally. Other new rules are introduced relating to furnace chimney-shafts (section 65).

An additional section of much importance (69) provides that, in every building constructed or adapted for separate tenements by more than two families, the principal staircase in common shall be ventilated upon every story above the ground story by windows or skylights into the external air. The staircase of every dwelling-house not subject to the above provisions is to be similarly ventilated. The rules as to habitable rooms (70) provide that, except for rooms in the roof, a room shall be in every part at least 8ft. 6in. in height from floor to ceiling; every room wholly or partly in the roof shall be at least 8ft. in height for at least one-half the area of such room; it shall have one or more windows opening directly into the external air, or into a conservatory, of a total area clear of sash-frames equal to at least one-tenth of the floor area of room, and of which a portion equal to one-twentieth of such area can be opened, the opening extending to at least 7ft. above the floor. A room having no external wall, or one in the roof, may be lighted through the roof by a dormer having a clear area equal to one-twelfth of the floor area, a portion of which, equal to 1-24th of such area, can be opened at least 5ft. above floor, or it may have a lantern light with a portion to open. Nothing in this Act is to affect, alter, or repeal any provisions of the Public Health (London) Act (1891) relating to underground rooms.

The rules as to Projections (73) are revised, the distance mentioned in the old clause of 15ft. between detached buildings and from ground of adjoining owner being omitted. All the projections enumerated are to be of brick, tile, stone, artificial stone, slate, cement, or other fireproof material, except eaves, barge-boards, and cornices to detached dwellings, in which the party-walls are corbelled out to project 4in. beyond such barge-boards or cornices. Sub-section ii. provides that balconies, cornices, &c., shall be tailed into wall and weighted or tied down, and that no cornice shall project more than 2ft. 6in. over a public way.

Sub-section iii. re-enacts the provisions now in force—viz.: in a street not greater than 30ft. wide, that any shop-front may project beyond the external wall to an extent not exceeding 5in., any cornice to project to an extent not exceeding 13in.; in a street of greater than 30ft. a shop-front may project 10in., and the cornice to 18in. beyond the external wall over the ground of the owner. No part of the woodwork of any shop is to be fixed higher than 25ft. above level of pavement, and no part of woodwork is to be fixed nearer than 4in. to the centre of party-wall, &c. Bay windows may be erected in a street of a width not less than 40ft., provided that they do not exceed three stories in height above the footway, and do not project more than 3ft. from the main wall, nor project in any part within the prescribed distance from centre of roadway, or nearer from the centre of nearest party-wall than their projection. Their united width must not exceed three-fifths of the frontage of building. Projecting oriel windows or turrets may be constructed in a street of a width not less than 40ft., provided no part of such projection extend more than 3ft. from the front wall, or more than 12in. over the public way, or be less than 10ft. above level of footway, or no part where it overhangs be within a distance of 4ft. of the centre of nearest party-wall, &c. As to separation of buildings, sec. 74 contains the provision that in every building exceeding ten squares in area used in part for trade or manufacture, and in part as a dwelling, the former part shall be separated from the dwelling-house part by walls and floors of fire-resisting materials, and all passages and staircases and means of approach to the part used as a dwelling be constructed throughout of fire-resisting materials. The part used for trade, &c., shall, if extending to more than 250,000c.ft., be subject to provisions relating to cubical extent of buildings of the warehouse class. This clause practically supersedes the existing sub-clause 4 of sect. 27. Sub-section iii. provides that, in every building exceeding 25 squares in area, containing separate sets of chambers or rooms tenanted by different persons, the floors and principal staircases shall be of fire-resisting materials. It will be noticed the existing clause requiring separate chambers contained in a building exceeding 3,600ft. in area to be divided as separate buildings has been repealed.

As to buildings of the warehouse class, the new Act provides (sec. 75) that, except as in this section provided, no building shall extend to more than 250,000c.ft., unless divided by party-walls, and no addition is to be made so that the cubical contents shall exceed that sum. The existing clause setting forth the statutory 216,000c.ft. for dwellings used, wholly or in part for trade, &c., is therefore repealed. Consent to larger dimensions (76) may be given if the Council are satisfied, provided the building shall not exceed 450,000c.ft. or exceed 60ft. in height, &c. The rules as to uniting buildings (77) require that they shall not be united except they are in one occupation, or are adapted to be so. No opening is to be made in any party-wall, or in two external walls dividing buildings which, if taken together, would extend to more than 250,000c.ft. (not 216,000c.ft. as now in force) except under certain conditions; one being that such opening shall not exceed in width 7ft., or in height 8ft., and such openings taken together shall not exceed one-half the length of such party-wall on each floor, &c.

Section 78 provides that every public building in every part shall be constructed in such manner as may be approved by the district surveyor, or in case of disagreement determined by the Tribunal of Appeal, and they are to declare their approval before it shall be used. Where houses, &c., are converted or altered into public buildings, such alterations shall be carried out as may be approved by either of those authorities. Section 80 provides that in new churches, chapels, public halls, lecture-rooms, exhibition-rooms, and public places of assembly, or additions or alterations thereof, every staircase for the use of the public shall be supported and inclosed by brick walls, not less than 9in. thick, and the treads of each step shall be of uniform width. Staircases, internal corridors, or passages for public use shall not be less than 4ft. 6in. in width. Where not more than 200 persons are to be accommodated, it may be 3ft. 6in. Staircases, corridors, &c., which communicate with any portion of building for the accommodation of more than 400 shall be increased in width by 6in. for every additional 100 persons until a maximum width of 9ft. be obtained. Two staircases may be substituted, each of two-thirds the width prescribed. Handrails are to be provided, and doors, &c, made to open outwards.

NOTES FROM THE ANTWERP EXHIBITION.

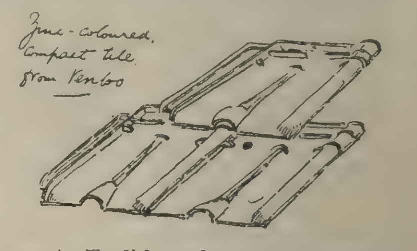
PART II.—MATERIALS.

TO speak in words of praise of Belgian materials, particularly if the particular material under consideration be iron, is one of the surest ways of rousing the ire of English manufacturers; yet what else can be done when one has to report upon the specimen exhibits of a national industry, where only the best is shown? In England, Belgian iron has a bad name, possibly as much through jealousy as through indifferent stuff having at one time been largely put upon the English market; but, to judge from the specimens at the Antwerp Exhibition, it is evident that the best English iron is no better than what can be produced in the little kingdom across the North Sea, and than will be produced, as good iron is more regularly demanded, despite its increased cost. Some specimens of slowly bent wrought iron, doubled until slow fracture set in, are especially wonderful examples of silky, fibrous structure, very difficult to beat.

It is not only in iron, however, that the Antwerp Exhibition is showing us how closely our industrious and frugal neighbours are running us, and it is a lesson which our discontented workmen may well take to heart that other industries, which we have been accustomed to consider especially our own, are being rapidly developed by them. Two firms (one bearing the English name of North), for instance, have exhibits of cements. North's are manufactured Portland cements of the English type, made at Beersse; while the other exhibit is of natural Portland and Roman cements from Tournai. The Portland is shown in the form of the clay-stone as excavated, and also as clinker after calcination; the Roman is like our own. No results of tests, however, are announced; but nothing is to be gathered from this, as throughout the exhibition (save in the "side shows" of jugglers, &c.), there is marked absence of that tendency of exhibitors to over-vaunt their goods which is so objectionable with us.

Clay goods, too, are in considerable evidence. The Tuilerie de Pottleberg at Courtrai, shows tiles of a homogeneous, terracotta-like clay, excellently made, and exhibits besides possibly the best system of fireproof flooring other than is to be found with us. It is exceedingly like that put upon the English market by Messrs. Homan and Rodgers; but the terracotta blocks are of the section of rolled-iron joists, and, unwisely, are not keyed upon the flanges for either the plaster ceiling under or the concrete floor over.

Another exhibit of roof tiles is to be found in the Dutch Court, and of these a sketch was obtained (see sketch), the shape of the tile being a new one to English workers. It is made of a zinc-coloured clay, having a kind of half glaze, is both homogeneous in structure and light in weight.



Close to this is found an exhibit of Dutch bricks, by M. Meiras. These, again, are more like terracotta than our English bricks in appearance, and would evidently not stand rubbing. They are true in colour and in form, and the moulded sections are excellently modelled. The colours, too, are hardly such as we are accustomed to. The buff and red are both of them terracotta shades, and there is besides a peculiar cool grey, which harmonises well with both the others. The ordinary bricks are made in two sizes, one $8\frac{1}{2}$in. by $4\frac{1}{2}$in. by $2\frac{1}{4}$in., and so approximating to that in use with us, and the other the common Belgian size of 7in. by $3\frac{3}{8}$in. by $1\frac{5}{8}$in., which is so exceedingly effective in the Flemish buildings.

Messrs. Utzschneider, Jaunez, and Co., who have works in Germany, Belgium, and Luxembourg, have an exhibit of floor tiles made in each country; but it is exceedingly difficult to discriminate between them. All are good, all are in the same quiet colours, and all, where showing patterns, are treated by being stamped upon the surface with equally good and simple designs.

There are other materials not so greatly in evidence. Four fine slabs are shown of Belgian encrinitic marble, highly polished, and although an attendant said that there was a large exhibit somewhere of Belgian stones, this was all that could be found after a diligent but hurried search.

Of woods, also, the only exhibit is a small one, and naturally so, as the indigenous timbers are few and small. They are well displayed, however, and a noticeable specimen is a section of oleander, a wood which, to judge from this specimen, ought to be considerably used for decorative work were it possible to obtain it in any quantity.

Another wood exhibited is the Karri wood (Eucalyptus collosea), or red-gum, from Western

Australia, now being so largely used in the London streets in the place of the creosoted fir, which it bids fair to replace entirely.

In the French courts there are several exhibits of pigments of rare brilliancy. That of Messrs. Ringaud and Meyer, of Paris, is especially rich in pure blues and reds, particularly the "laque blue," "blue de preusse," and the various vermilions, of which several shades are displayed, together with a bar of cinnabar wood.

It would be impossible to close these notes on materials without reference to the essentially Belgian mineral product—zinc. The exhibit of the Veille Montague Zinc Co. is given the place of honour of the whole exhibition, exactly facing the main entrance, and it may be said to well deserve it, rather, however, from the intrinsic value of the material than from the beauty of the exhibit.

There are many exhibits of British materials by British firms; but no mention of them is necessary here, the intention of these notes being to put before their readers such things as are to be seen at Antwerp as are not to be found with ourselves.

TESTING BUILDING STONES.

A USEFUL paper is given on "Testing Building Stones," by F. Linwood Garrison, Assoc.M.Am.C.E., in the *Transactions* of that society. Speaking of "bed, or natural position" of stones, the author shows the importance of determining the natural bed so that the pressure be applied upon the bed. The maximum strength of a stone is always developed when the pressure is applied in a line perpendicular to its natural position or "grain." This position is difficult to determine in many cases. Even at the quarry, the author says, "it may puzzle an experienced geologist to determine the original or natural horizontal bed of the rock if it be of sedimentary origin, or a metamorphic rock, and when eruptive it may be quite impossible, although most, if not all, eruptive rocks have a tendency to break in certain directions or planes in which the cohesive power of the stone is weakest." In some metamorphic rocks the bedding is made distinct by the distribution of the mica, its laminæ being arranged in parallel planes, giving a stratified appearance to the rock, as in gneiss (stratified granite). Sandstone laid on their natural bed will weather better, because they most readily absorb moisture in the direction of their grain or bed; and, further, it will withstand a greater amount of heat without disintegrating, and thus be able to resist longer during a fire. The character of the fragments produced by testing (crushing) ought to be noted, says the author, as in the stronger stones there is a tendency when the pressure is applied on the bed for these pieces to assume pyramidal shapes with round edges; in weaker samples, or if the pressure is applied edgewise, the fragments assume an angular, flaky character. Crushing, shearing, and bending strains are usefully applied to stone. The first is generally considered sufficient. As to the form of the cubes for testing, it is stated that a stone will develop its maximum resistance on the largest cubes. They should be prepared with care, sawing and grinding to the required dimensions are a better way of bringing them to the size than dressing them by hammer and chisel, which produce minute cracks. The face in contact with the compression plates of machine should be perfectly even and smooth, or otherwise cushions of plaster of Paris or other material must be provided. Shearing strength is considered one of the most useful tests, though very seldom made. Mr. Garrison, whose paper we refer to, describes a method for this test recently adopted by him.

COTTAGES OR FLATS FOR THE WORKING CLASSES.

VARIOUS experiments have been made towards the solution of the problem of housing the working classes; but the general results have been far from satisfactory. The "tenement" house, or dwelling in "flats," erected in London, Liverpool, Manchester, Glasgow, and other great cities, have only proved that concentration and crowding have been attained at a sacrifice of the healthful conditions of family life, and that we must look for some other mode of providing dwellings. The suburb, served by a frequent service of trains at cheap rates, appears to be more favourably entertained by promoters of the rehousing movement, the great consideration being that land for building can be obtained at less price, and small separate dwellings erected for each family, which conditions are out of the question in the denser neighbourhoods of our towns. The land near railway stations, and the sidings of our main lines give undoubted opportunities for building this class of house. We might name both on the north and south sides of London large colonies of working-men's dwellings which have been erected near the stations, but without any apparent intention of, and certainly wanting in, those elements of appropriate design which are so necessary. They have generally been mere speculation on the part of private builders, without regard to plan or the comfort and convenience of the tenants. The requirements of tenants of the class we are treating seem to point to self-contained cottages in flats or blocks of two stories, each having an independent stairway from the street, and each containing two or three rooms. Such houses are often called "Scotch" houses, though for what reason is not very clear. In Liverpool the Corporation have set a good example to other towns in erecting several types of dwellings, to some of which we have referred on a previous occasion, and the paper read by Mr. H. Percy Boulnois, M.Inst.C.E., city engineer of Liverpool, last week reviews some of these cottage-dwellings. That gentleman lays it down as a condition based on experience, that the rent to be paid by the poorest of working people ought not to exceed an average of *one shilling* per room per week. The nearest approach made to this requirement in Liverpool has been in tenement-houses or dwellings in flats. Of the six-roomed and four-roomed houses built during the last 30 years, the former let at a rental of 7s. 6d. per week, the latter at a minimum rent of 5s. The rent of the usual house therefore averages 1s. 3d. per room per week, which is too high for labouring men who earn only 20s. to 30s. a week, which wages, if reduced to an average by want of regular work, only amount to 15s. or 20s. per week. One fifth of their income is the most they can pay in the shape of rent, or 3s. or 4s. per week, including rates and taxes. But such a low rental is unremunerative in Liverpool, and we know no decent dwelling can be obtained in London at the rental. The four-roomed cottages erected in Liverpool are the smallest which can be let at a profit. Cottages with a less number of rooms cannot be obtained unless sites filled with back-to-back houses are cleared. The demand seems to be, as pointed out by Mr. Boulnois, for cottages of two or three rooms, as there are many working men who cannot pay rent for more.

Thousands of tenement dwellings appear to have been built in Liverpool. These are erected in rows or blocks of two stories. The ground-floor of each is a complete house, containing two or three rooms. On the first-floor level the same series of complete three-roomed houses are repeated, and each of these has its own stair directly from the street. The two-roomed dwelling lets at from 3s. 9d. to 4s. per week. The earliest dwellings in flats were built before the bylaw as to open spaces in the rear was in force, and these are of three and four stories, and built on the ordinary plan with common stair in middle of block. Now a large number are unoccupied, and the net return is about 4 per cent. The lowest rent is at the rate of 1s. 4d. per room, the highest 1s. 10d.

The examples given of blocks erected by private investment of three stories have equally proved failures. Tenants could not agree to joint occupation, or refused to pay 5s., 4s. 6d. or 4s. for rooms according to their height, or for some other reason not difficult to discover, these blocks have not proved a success. The open spaces round some of these blocks are mere wastes for refuse, and are unsightly and offensive. The Corporation speculations in this direction show an improvement; many of the blocks were built from designs of Liverpool architects, and realise an interest of from 2½ to 3½ per cent. The experience gained in this large city has shown that the self-contained two-story cottage in flats satisfies the working man much more than the many-storied block of flats. The question remains how to build them. There is a tendency to repeat the same plan and elevation. We can do much better by varying both within certain limits, making some of the dwellings two-roomed, others three and four-roomed, in changing the sizes of the rooms, and giving a little variety to the elevation. Gardens or spaces in the front and rear, though small, would much add to the appearance and comfort of these tenement houses, and so would their arrangement round quadrangles or crescents. The common open spaces of the ordinary blocks of flats as we see them in London, asphalted as playgrounds, are ill-appreciated by the tenants except as playgrounds for their children; they are generally damp, draughty, and sunless; the continuous balcony along the front of each flat is the only outlet, and a poor one at the best. Worst of all, the London block of flats has too much of the barracks or workhouse about it to make it attractive to the working man. He sees the pleasant rows of detached dwellings in the suburbs for the middle-class tenants, each with its own appointments and self-contained, and he naturally asks why he cannot also have his own self-contained dwelling instead of being compelled to live in a crowded block without any space for recreation. The Liverpool by-laws make it compulsory to leave an open space at the rear of every house not less than the height of the rear wall of house, so as to limit the height of a house to a line drawn at an angle of 45° from the rear property, and each space must abut on each of the three sides on a similar open space or on a street. It also prevents any blocking in by other buildings. Rows of houses of this class might be broken at intervals by cross thoroughfares or passages by which the circulation of the air is insured and the elevation diversified.

THE RENAISSANCE AND BAROCCO IN PAINTED GLASS.

THE fourth and last volume of the "History of Design in Painted Glass," by Mr. N. H. J. Westlake, F.S.A.,* entirely bears out the character which distinguished the earlier volumes of this able and comprehensive record, enriched as it is with almost numberless illustrations, accompanied by critical and practical remarks such as only could be insured by actual experience in the practice of the art, coupled with an intimate acquaintance of the archæology of the subject. The work, which the author commenced to publish with so marked an enthusiasm thirteen or fourteen years ago, necessarily proved a task of no small magnitude, particularly for one actively engaged in the pursuit of his profession as an artist in decoration and glass. The conclusions

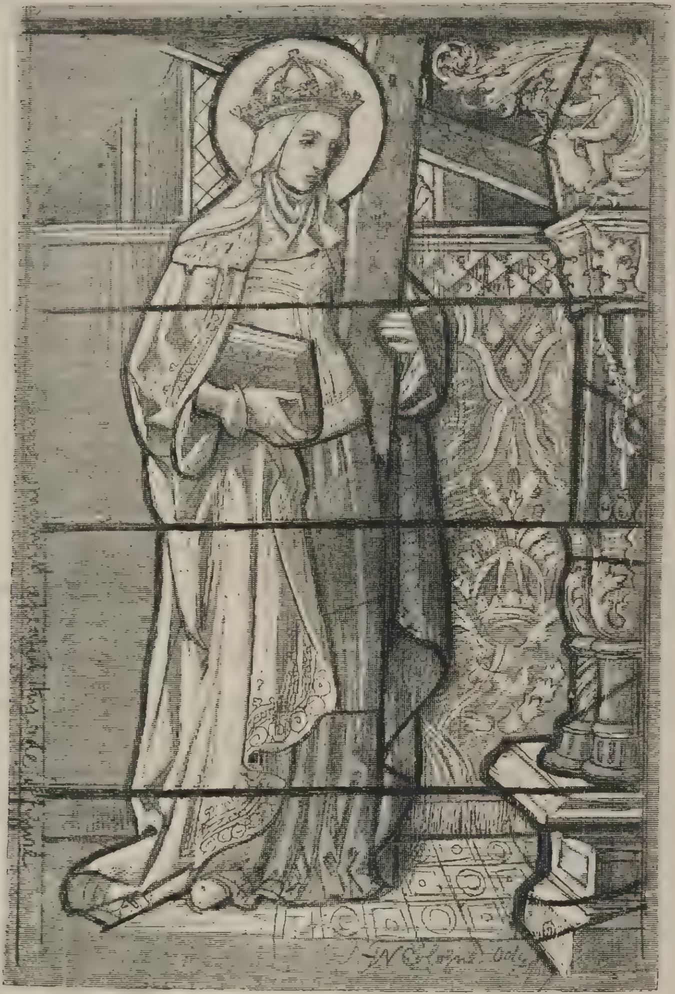
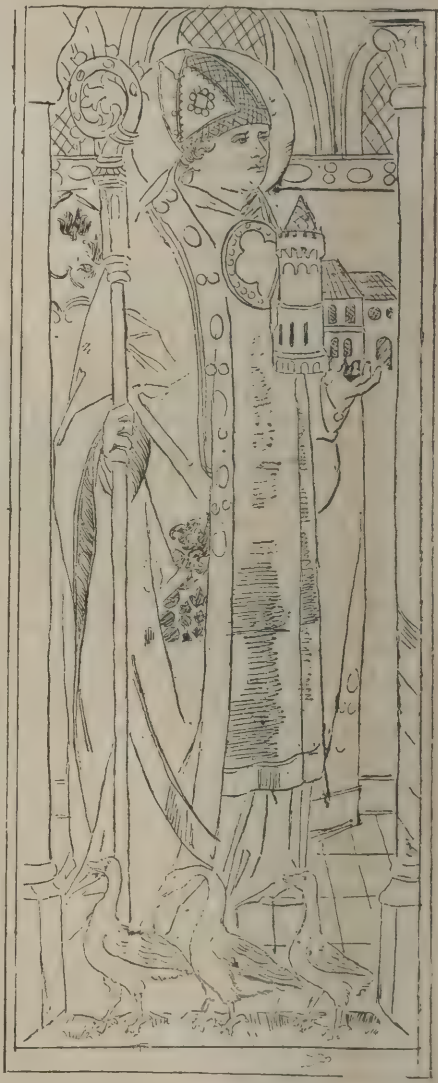
* A History of Design in Painted Glass. By N. H. J. Westlake, F.S.A. Vol. IV. London and Oxford: James Parker and Co., 1894.

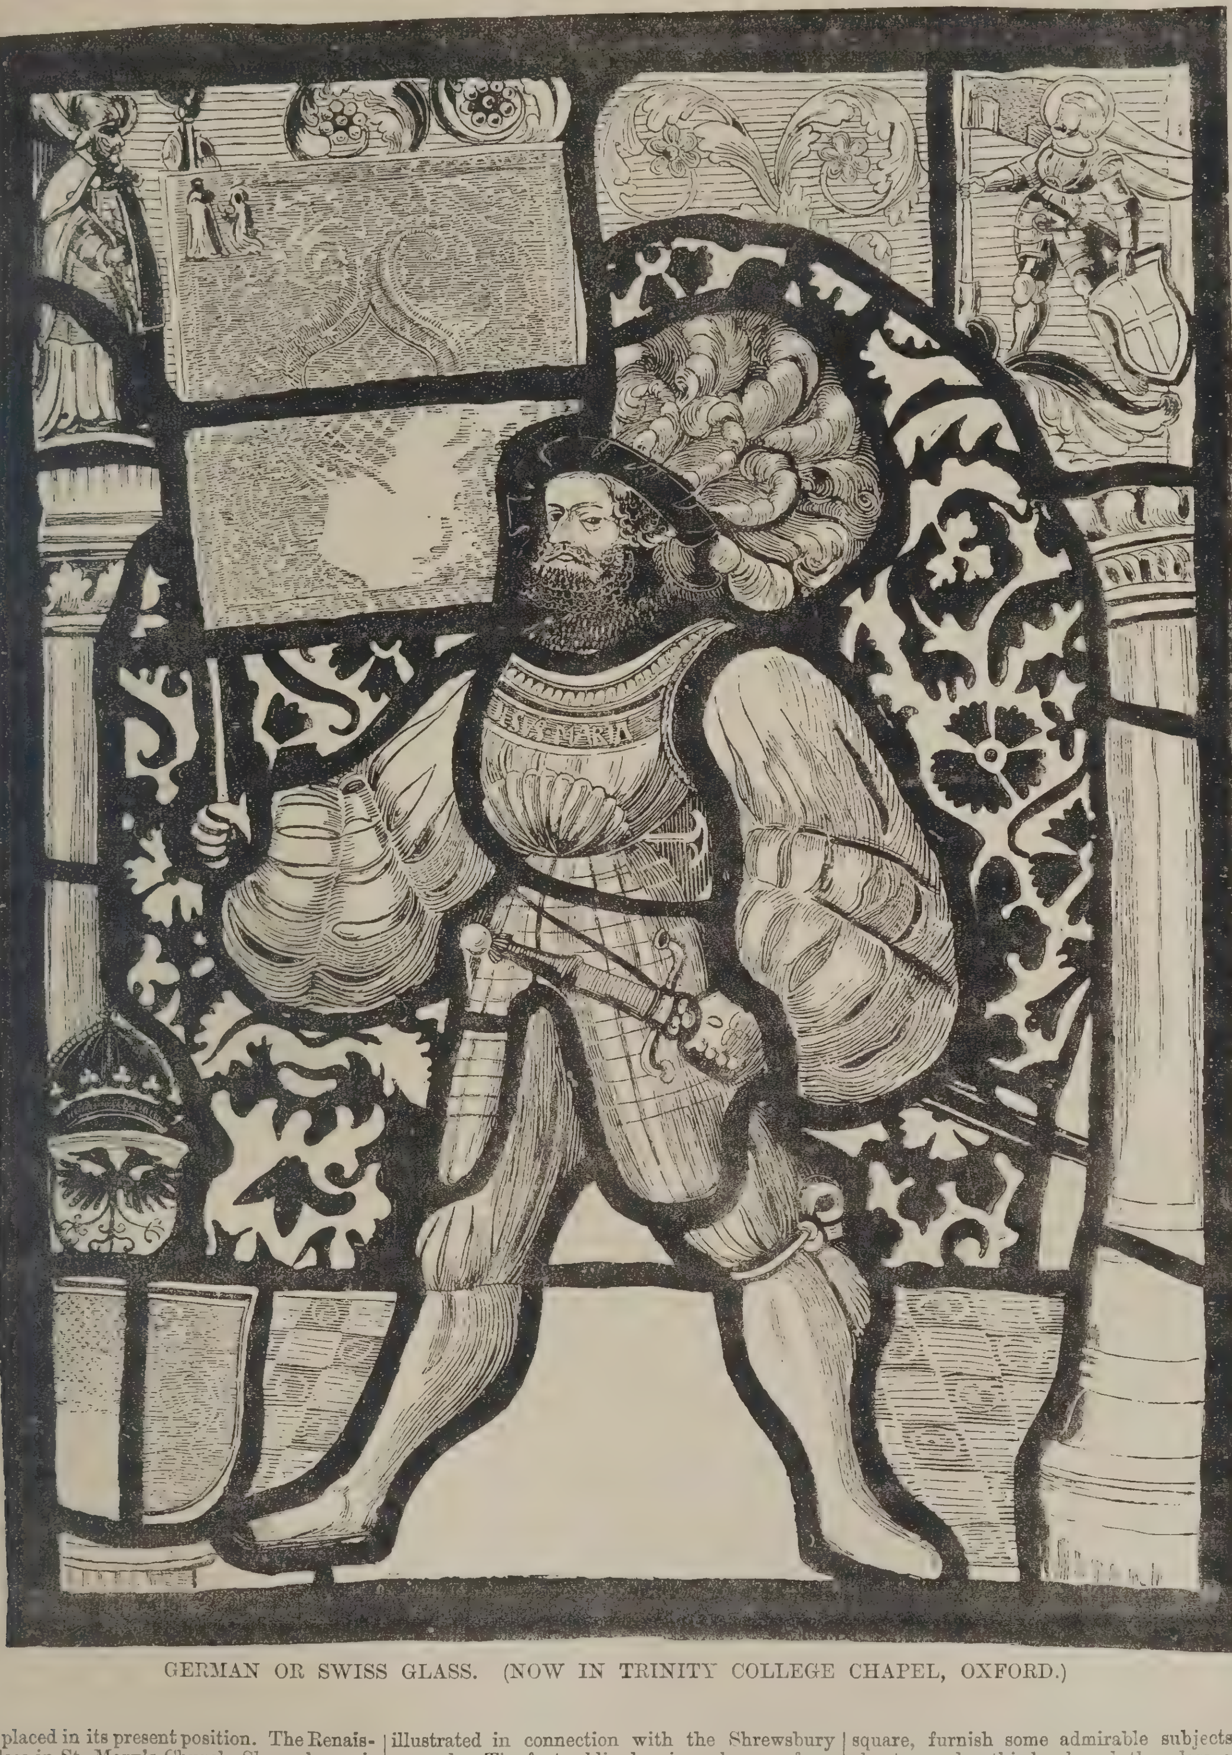


ST. HELENA. (FROM COLOGNE.)



ST. MARTIN.
(Now in St. Mary's, Shrewsbury.)

and suggestions thus put upon record in the spare leisure at his disposal naturally bear in parts of the treatise the trace of haste in style and expression; but this is perhaps more evident in some of the drawings which illustrate the text, so that in individual instances, judged as permanent records of detail in design, Mr. Westlake's sketches would have gained somewhat in value if a more careful manner had been adopted. It is, however, but right to presume that many of the outlines and illustrations are only intended to furnish a general notion of the specimens alluded to by the writer, as of course it is scarcely possible to give more than an impression of stained or painted glass in black and white delineations, seeing that so much always must depend upon the translucent brilliancy and jewel-like decorative effect of the originals, to say nothing of tone and colour, which monochrome renderings can never represent. Anyhow, Mr. Westlake has not sacrificed the character of his examples chosen for illustration by exhibiting them in a hard and mechanical way simply to secure effective blocks among the type as specimens of black and white draughtsmanship, telling enough to the superficial reader, but absolutely misleading and worthless to the professional student. The volume before us opens with an essay on painted glass in England during the sixteenth and seventeenth centuries, which includes the work of the Renaissance, or what was then called "the New Style," marking the gradual subsidence of Gothic features, and eventually developing into the degradation of the Barocco or Rococo. The ability and excellence of the artists of all periods unquestionably must be recognised in any comprehensive record of the kind, and when Mr. Westlake expresses, by way of preface, his desire to do justice to all, we accord him the credit of having accomplished with success the catholic discrimination with which he undertook his review. The names of several artists employed, both at home and abroad, during the sixteenth and following century in the production of painted glass are very useful for reference, and, although only the more distinguished designers are included, the compilation of such a list must have entailed no little labour. By no means the least interesting evidence thus introduced is that the English glass of this period ranks among the best then executed. The resemblance to foreign styles in English work is in no way surprising, it being evident that our schools were continually recruited from the Continent, as well as clear that English artists went abroad to work. The exact date of much of such work, as indeed in the earlier periods of the art, must remain a question of difficulty even among accomplished judges, seeing that the older artists still worked in the style of their youth, with only slight adaptations from the coeval schools of younger men then rising into favour. Thus at King's College, Cambridge, the glass is distinguished by a determined Renaissance character, although it was probably earlier in actual date than some of the work in St. Neots, Cornwall, and very shortly after the Late glass in the north transept at Malvern. Interweaving thus in style, it naturally follows that windows were produced which illustrate different types of detail, rendering the Renaissance work most interesting; for seldom is any striving after mere novelty allowed to assert itself, but the artistic faculty for harmonising apparently discordant features obtains the pre-eminence. Canopies were gradually abandoned, and the pictures were more frequently placed in openings without any ornamental surroundings, as at King's College, Cambridge, and in much of the work of certain French schools, though the use of accessory enrichment in Flemish, German, and Italian examples was by no means given up, and such French artists as Engrand le Prince, Jean Cousin, and Pinaigrier, uninfluenced by meretricious coeval work in their own country, rank among the foremost of their day. The figure work of this period not infrequently is gross and marked by a quasi-realism too evidently representing the artist's own models, and often very unlike the ideal which the intellect pictures of the characters depicted. The women are fat and puffy, and the men are huge-limbed as dray-horses, the refined and spiritual type by the earlier Christian artists being seldom found; the mortified look of the Mediæval and Cinque-Cento Italian representation of saints was despised and not studied at all. Notable exceptions occur, and some of these, when available, Mr. Westlake has chosen for illustration. After dealing with the draperies and the questions of profile, modelling, shadowing, chiaro-oscuro, and also the principles of composition observable in work of this period are duly described, with heraldry and pattern glazings, concluding with remarks on enamelling in various colours. Space precludes our following more fully the details thus entertainingly introduced and subsequently elaborated in the folio under notice, and we shall therefore content ourselves with a brief reference to the drawings which we have selected by way of laying before our readers in the best possible way the style of illustration which Mr. Westlake has brought together for elucidating his descriptions. The lily in its pot from the chapel of the Holy Ghost at Basingstoke is only a fragment of the beautiful work which ranked among the finest glass in the kingdom, such as that at Fairford and Canterbury. The composition, though said to be Flemish or even French in origin, is, in Mr. Westlake's judgment, most likely to be English, carrying our tradition of design from Winchester to Cambridge, where the King's "glasyers," Flower and Hone of Southwark, carried out work under Bishop Fox, who was personally interested in Lord Sandys' chapel at Basingstoke. The subjects illustrated are from the Lives of our Lord and St. Mary the Virgin, the lily pot being taken from that of the Annunciation. The date of its execution is about 1525-35. The glass is now in the windows of the parish church at Basingstoke, and was recovered from obscurity in 1869 by the vicar, Dr. Millard, from Mottisfont Abbey, where the glass had remained hidden, but safe, till Lady Mill allowed



GERMAN OR SWISS GLASS. (NOW IN TRINITY COLLEGE CHAPEL, OXFORD.)

it to be placed in its present position. The Renaissance glass in St. Mary's Church, Shrewsbury, is foreign, possibly Flemish, combining features peculiar to the Cologne school, and the figure of St. Martin with the three geese, which we illustrate, is from the "Adoration of the Magi" window, which, with the St. Bernard window, mostly in white glass, in the north aisle, is among the best to be found in this country—the figure of "Our Lady of Sorrows" in the top of the Magi window ranking among the most beautiful examples of such work which the author has ever seen Some of the smaller subjects may be German of the same type, as St. Helena from St. Mary's, Lyskirchen, Cologne, herewith illustrated in connection with the Shrewsbury example. The foot soldier bearing a banner, from Trinity College, Oxford, is a specimen of Swiss or German chamber glass in which the colour is leaded in pot-metal not enamelled. This heraldic method of decoration became the most common, and many designed in this way were most elaborate, the later examples often being marvels of enamelling. Coats of arms, picture roundels, and other subjects, enriched plain white glass, ornamentally leaded windows, as at Billing Castle, near York, in Warwick Castle, South Kensington Museum, or the Louvre. The Jesse tree windows of the sixteenth century, such as that from Mechlin now in St. George's, Hanover-square, furnish some admirable subjects in the chapter under this head, and the glass of Spain is by no means overlooked. The author finishes his work with a chapter on secular glass and plain glazing, and in a final note takes leave of his task, which he says has occupied nearly forty years to compile. In his youth it afforded recreation; its completion will leave a void like the loss of an old friend. Among his readers, however, it is not improbable that many a new friend will be secured. In modern work, which is good, consolation may be found, provided that the object which governs the making of a window is not overlooked—viz., the admission of light. Perhaps "two thirds of white glass and one third of coloured" is too great a proportion, but no doubt a simple scheme of colour insures the best effect, and at most not more than eight colours should be employed. The harmony between the glazing and its frame is another point to be insisted on, and in every case the glass used in a building should agree with it in style. Much new work complies with these conditions, and a great deal of it no doubt is very good indeed. Mr. Westlake's volumes will tend to further this standard of excellence, and make it still more general.

PRESERVATIVE PAINTING FOR METALS.

In a paper by Mr. M. P. Wood, read before the American Society of Mechanical Engineers, it is stated that graphite, mixed with pure boiled linseed-oil to which a small percentage of litharge, red lead, manganese, or other metallic salt has been added at the time of boiling to aid in its oxidation, forms a most effective paint for metallic surfaces, as well as for wood and fibre. Recent experiments with this paint applied to the surface of boiler-tubes show it to be very effective in preventing the formation of scale. Mr. Wood commends the system of requiring all iron and steel intended for structural uses to be pickled and cleansed from mill scale; declaring it to be an absolutely indispensable condition for all material of the kind intended to be preserved from rust by painting. It should then be painted two coats with pure raw linseed-oil and red lead, after which the metal will stand the weather for 50 years without further treatment. Mr. Wood gives a ready rule, deduced from his own experience, to determine the quantity of paint required to cover any structure. It is as follows: Divide the number of square feet of surface by 200, the quotient will be the number of gallons of liquid-paint required for two coats. Or, divide the area in square feet by 18, and the result is the number of pounds of pure white lead required to give three coats, where this pigment is permissible. Red-lead paint should be treated like Portland cement—applied to the work fresh, and allowed to take its initial set where it is to remain. A gallon of good red-lead paint contains 5lb. of oil and 18lb. of red lead; and it will cover, for a first coat, about 500sq.ft., and as a second coat about 600sq.ft. of surface.

BOOKS RECEIVED.

In a privately printed pamphlet on *The Relieving Arch*, Mr. W. A. Henderson discusses the theory of the Roman development of the Etruscan arch, based on recent visits to Rome, Florence, and Milan. He quotes from Professor J. H. Middleton and the late E. A. Freeman in support of his argument that the relieving arch of ancient Rome must have been a reality, and not mere surface tattooing; but complains that the majority of architectural writers have failed to adequately describe such structures as Brunelleschi's octagon, from ignorance of the structural anatomy of the relieving arch.—— *A Healthy Home*, by Francis Vacher, County Medical Officer for Cheshire, &c. (illustrated) (London, published at the office of the *Sanitary Record*, Lexham-gardens), is a little book intended as a guide to house-owners and tenants in sanitary construction and fittings. The author has given a brief summary of the sanitary requirements of a dwelling-house, a subject which he has been lecturing about at several provincial towns. The general reader will find the advice given as to site, soil, and aspect, building materials, construction, design, warming and ventilation, and sanitary appliances generally, sound and reliable. Plans and sections of labourers' cottages are given, and advice about materials and the construction of cavity walls. Sections of walls, with areas and cavities to prevent the passage of moisture, and the bond of brickwork, are illustrated; and the householder and owner of property will find in Mr. Vacher's book a variety of miscellaneous information on the points and sanitary equipments of a healthy house.—— The *Engineering Magazine*, September (London: Salisbury-court, Fleet-street), is a varied number. Mr. Dankmar Adler has a second article on "Theatre Building for American Cities," which we noticed in a recent number. Mr. Adler enters into the subject of seating, lighting of the auditorium, the colour decoration, heating and ventilating, &c. Plans and sections of several theatres are given, including the Pueblo Opera House, Grand Opera House, Chicago, the Schiller Theatre, Chicago, the Central Music Hall, of the same city. Large foyers and lobbies are recommended to insure safety and comfort; and American theatres are often deficient in these respects, as well as in dressing-room and wardrobe accommodation. Mr. Adler's remarks are worth the attention of all theatre promoters. We believe the box-office receipts would be considerably increased if the convenience and comfort of the public were more studied, instead of being subordinated to the number of people that can be crammed into the auditorium. "The Commercial Aspects of the Japan-China War," "The Richmond Electric Railway," "The Present Condition of the Panama Canal," &c., are other papers of interest.——*Notes on Docks and Dock Construction*, by C. Colson, M.Inst.C.E., with illustrations (London: Longmans, Green, and Co.), is another volume of Longmans' Civil Engineering Series, and a worthy successor to "Tidal Rivers," which we lately noticed. Mr. Colson, assistant director of works, Admiralty, does not write an exhaustive treatise on docks, but places before the student a valuable collection of notes based upon the author's observation and practice, and compiled from other sources. These "Notes on Dock Construction" will be found of considerable use and value to all engineers and others interested. The earlier chapters deal with the classes of docks, the width of basins, wharfage, jetties, tidal docks, relation of sectional area of entrance to dock area. Several examples and plans of docks are given, including the Tilbury Docks, New Tidal Docks, Southampton, the docks at Avonmouth, Hull, Cardiff, Penarth, Calais. The chapters on dams, embankments, coffer-dam construction, water on foundations, dock and quay walls, dry or graving docks, closing entrances, deposits, slipways, dredging appliances, cost of works, &c., &c., will be found of much practical value in design and the superintendence of dock works. The diagrams, plans, and sections are clear and well drawn, many of them figured from actual works.

OBITUARY.

We regret to announce the death, from gastritis, on Sunday last, at the age of 53 years, of Mr. William Topley, F.R.S., who had been for upwards of 30 years an officer of the Geological Survey. Soon after leaving the Royal School of Mines, in 1861, he became attached to the Survey, working first among the Cretaceous strata of the south-east of England, and afterwards among the Carboniferous rocks of the Northumberland coalfield. His chief literary work was a monograph on the Weald, published as a survey memoir in 1875. He also contributed many papers to the Geological Society, the Geologists' Association, the Anthropological Institute, and the Society of Arts, and leaves behind much uncompleted scientific and literary work. Mr. Topley was an authority on water questions and on agricultural geology. When the International Geological Congress met in London in 1888, he was one of the local secretaries, and he was present at the Zurich meeting of this body at the end of August last.

Mr. W. Wright Campbell, M.S.A., of the firm of Rowe, Campbell, and Spain, architects, of Vickery's Chambers, Pitt-street, Sydney, N.S.W., died on August 19, at the early age of 42 years, from an attack of influenza. Mr. Campbell was a native of Glasgow, and served his articles with Mr. William Spence, a Classic architect having a large practice both in Scotland and Ireland. Mr. Campbell afterwards entered into practice on his own account in Glasgow, and carried out several important works in that city and at Moffat and Kilmarnock. About nine years ago, owing to failing health, he emigrated to Australia, and on arriving in Sydney, he found occupation in the office of the then firm of Rowe and Green as clerk of works. His abilities were quickly recognised, and he was taken into the firm's office, and at once became their manager. Under his management Messrs. Gardner's warehouses were erected, and then followed the Centenary Hall, the A.M.B I. Buildings in Pitt-street, and the Imperial Arcade. Five years ago, when the Professorship of Architecture in the Sydney Technical College became vacant, by the resignation of Mr. Hennessy, Mr. Campbell was elected to the post by a large majority of the Board, and the appointment was more than justified by the phenomenal success attained by his pupils at South Kensington. A few months since Mr. Campbell, with Mr. Alfred Spain, joined Mr. Thomas Rowe, F.R.I.B.A., in partnership. Mr. Wright Campbell had been since 1885 a member of the Society of Architects (London), and he was a Fellow of the Institute of Architects of New South Wales and a member of the Sydney Architectural Association. He leaves a widow and two children.

The well-known explorer of the Catacombs of Rome, the Chevalier de Rossi, died at Castel-Gandolfo on Sept. 20th, at the age of 72 years. His discoveries in the catacombs not only rendered him famous, but excited much antiquarian and ecclesiological controversy; his "Inscriptiones Christianæ urbis Romæ" comprised 12,000 examples. He is best known to the British public by his "Subterranean Rome."

Mr. Launt Thompson, a well-known American sculptor, died in New York on Friday last, aged 61 years. He was born in Queen's County, Ireland, and at the age of 14 he went to America, where he studied his art under Erasmus Palmer. In 1858 he moved from Albany to New York, Here his fame as a maker of medallion portraits soon brought him numerous orders. He became an associate of the Academy of Design in 1859, and in 1862 his bust "The Trapper" secured his election as an academician. In 1868-9 he was in Rome, and from 1875 to 1881 he lived in Italy. He was vice-president of the National Academy in 1874. Among his works are "Elaine," a bust, "Morning Glory," a medallion, and portrait busts of William Cullen Bryant and of Edwin Booth as Hamlet, while his statues of prominent Americans are to be found in more than 20 American cities.

CHIPS.

The name appears in Friday's list of adjudications in bankruptcy of Charles Pinn, of Exeter, architect and surveyor.

At Rochdale, on Thursday in last week, the Right Hon. Sir J. T. Hibbert formally presented to the guardians of the poor a full-length portrait of their chairman, Alderman Schofield. It has been painted for a body of subscribers by Mr. F. W. Jackson, and will be hung in the guardians' board-room at Townhead.

The monument to the poet Shelley, which has been erected on the beach at Viareggio, was unveiled on Sunday by Signor Riccioni, President of the Executive Committee. The monument is directly facing the sea, and its total height is 15ft. The pedestal is of marble, and the bust of Shelley, by which it is surmounted, is the work of Professor Urbano Lucchesi, of Florence, and represents the poet at the age of 29. The eyes are gazing across the sea, and a pen just laid down appears from under the folds of the cloak. On the side away from the sea, encircled by intertwined branches of oak and olive, is a book bearing on its cover the word "Prometeo."

The proprietors of the Holborn Restaurant have added a new annexe to the western portion of their premises to be called the "King's Hall," and on Saturday night they gave a dinner to upwards of 600 of the workmen who had been employed in its construction. Mr. T. E. Collcutt, the architect of the new building, presided. This western block has a spacious covered entrance in Newton-street. The contractors were Messrs. Holland and Hannen, and Messrs. Maple and Co. have carried out the upholstering and furnishing.

A new gas-holder and tank have just been completed for the Gas Company at Malmesbury. The tank, resting on a solid block of concrete, 50ft. 6in. wide by 2ft. 3in. thick, is 51ft. 6in. in diameter by 16ft. deep, built above the ground level, and is made of cast-iron plates. The holder is a single lift, holding about 31,000c.ft. of gas, while the tank holds about 300,000 gallons, or 900 tons, of water.

Progress is being made with the scheme for the erection of a pleasure pier and pavilion opposite Regent-road, Morecambe, at the west end of that watering place, for which Parliamentary powers were recently obtained. At a meeting of property-owners held the other day, Mr. Littlewood, architect, Manchester, described the plans. The pier will be about 2,400ft. in length, with a pavilion 600ft. from the entrance, and approached by a covered way. The pavilion will be 90ft. in length, 50ft. in width, seat about 1,200 people, and have on each side shops. At intervals of 150ft. there will be recesses on each side of the pier, on which little covered shelters will be placed, and at the extreme end a band kiosk and seating accommodation for 400 people, in addition to refreshment-rooms, shops, and shelters. The width of the pier will be 35ft. to the pavilion, and 24ft. for the 1,500ft. beyond it. The width of the present pier is 21ft.

CAXTON CONVALESCENT HOME, LIMPSFIELD, SURREY.

This building, the cost of which is being defrayed by Mr. J. Passmore Edwards, the President of the institution (and the foundation stone of which will be laid to-morrow by the Lord Mayor, Sir G. R. Tyler, Bart.), is being erected for the benefit of the Printing and Allied Trades on the Chartlands Farm Estate, adjoining Limpsfield Common. The site is just below the crest of the hill, and is well sheltered from the north and east, whilst it commands a magnificent view over the broad valley below and the long range of the South Downs. The building comprises a two-storied block, with returned gabled ends, containing dayrooms and dormitories, &c., for 50 patients (men only), with one-storied extensions in the rear for administrative offices, &c. Advantage has been taken of the quick fall in the ground from north to south to construct a basement at the south end of the main block to contain, besides large cellarage, a smoking or billiard-room, with cloak-room and lavatories. The patients' general entrance is also on this floor. Provision is made for the construction in future of a number of additional rooms in the roof of the building to accommodate 22 beds. A small bedroom is provided in the tower below the cistern chamber and above the latter a "sun" room, lighted on all sides. The dormitories allow a minimum of 750c.ft. for each patient, and special care has been taken to secure ample light and ventilation to all parts. All rooms are provided with open fires, and the corridors, &c., will be heated by low-pressure hot-water pipes. The external walls generally will be faced with red bricks relieved with Bath-stone dressings, the upper story being hung with red plain tiles. The roofs will be covered with brindled plain tiles. It is only proposed at present to erect the centre portion of the building, to accommodate twelve patients, and the cost of this work will be defrayed entirely by Mr. J. Passmore Edwards, the President of the institution. The foundations of the whole building are being carried out by Mr. R. Durtnell, builder, of Brasted, Kent, under the direction of the architect, Mr. A. Saxon Snell, F.R.I.B.A. The clerk of works is Mr. A. S. Brighty.

CARTOONS OF ANGELS, HOLYWELL CHURCH, OXFORD.

These paintings have been executed in Holywell Church, Oxford, above the chancel arch. They are executed in tempera on the plaster face of the wall. The central group consists of the "Rood," with St. John and St. Mary, and on either side are figures of angels. The work was carried out last year, when the new clerestory windows were placed in the south aisle, the architect being Mr. E. P. Warren. Holywell church is situated somewhat in a sequestered position, so that few sightseers visiting the University City are aware of the work which has been done in the building. It is intended to decorate the west wall of the church in harmony with the other work which Mr. Hallward has so well carried out.

ST. KATHARINE'S LODGE, REGENT'S PARK.

Our illustration shows the alterations and additions recently carried out for Mr. C. Brinsley Marlay, under the directions of Messrs. Lee and Pain, of No. 63, Lincoln's-inn Fields, architects, by Messrs. W. Longmire and Co., and Messrs. Bush and Son, builders. The additions comprise a new wing shown on the left of the illustration, with new oriel window, and the works include the entire renewal of the stonework and partial underpinning of the house and the rebuilding of the stables, &c. The original house was built about 60 years back from the designs of the late Ambrose Poynter, architect, together with the church and almshouses opposite, when he replaced the buildings of St. Katharine's Hospital, removed for the construction of the St. Katharine's Docks.

CROSCOMBE CHURCH PULPIT AND CHANCEL SCREENS.

Last week we gave some notes descriptive of the collection of Architectural Photographs by Mr. John L. Robinson, R.H.A., now on view at the Royal Architectural Museum, Westminster, from Wells and the neighbouring country in Somersetshire. To-day we reproduce from this exhibition two specimens of his skill in illustration of the uncommonly rich and refined Renaissance woodwork from Croscombe Church, near Shepton Mallet. We gave a view of the interior of the building in our pages for August 10th last, and measured drawings both of the pulpit, with its ornate sounding-board tester canopy, and of the screen in front of the chancel, will be found in the Building News for July 26 and Sept. 27, 1889.

A SCOTCH SUBURBAN VILLA.

Mr. David B. Burnie is the architect of this villa. No further particulars have reached us in response to our usual invitation.

FIREPLACE AT MADRESFIELD COURT.

This fireplace was designed in such a way as to utilise three pairs of rare antique marble and granite columns, brought from abroad by a former Earl Beauchamp. The woodwork portions are of walnut, carved by Mr. H. H. Martyn, of Cheltenham, and the whole was made from full-size drawings prepared by the architect, Mr. J. S. Alder, of Palmerston-buildings, Old Broad-street, E.C. The fireplace is in the new staircase gallery and library, adjoining the great drawing-room of Madresfield Court, near Worcester, the seat of Earl Beauchamp.

INLAID CABINET AT HOLYROOD PALACE (R.I.B.A. PUGIN STUDENTSHIP DRAWINGS).

This is a beautiful and quaint example of inlaid work, in which the usual foliated patterns of the period are varied with a conventional treatment of landscape in the larger panels. The variety of woods and the skill displayed in their selection are manifest, and by these means the drawing in the design is greatly enhanced. The graining also assists the expression of the design, while the quality of the material shows the maker of the piece to have been a master of his craft. It is probably of Dutch manufacture, though in its delicate mouldings it has a strong similarity to the Scottish examples of this date (Late 16th century); but in these the inlay is usually much simpler, and plays a more subordinate part. J. J. Joass.

DINING-ROOM, BROOKLINE, MASS.

This characteristic interior from America, drawn by Mr. Thomas M. James, of Boston, illustrates the dining-room of Mr. J. H. Gibbs' house at Brookline, designed by Mr. Eugene L. Clark, the architect of the building. The window-opening over the buffet-like recess in the long side of the apartment indicates a somewhat unusual arrangement, probably contrived to insure a view. The cabinet fitments and recessed cupboards and drawers on either hand of the fireplace seem arranged with the object of convenience, and they take their place in harmony with the general treatment of the room. Our sketch is borrowed from the *American Architect*.

CAMPSALL CHURCH.

Between Doncaster and Pontefract, in a most delightful village, stands this remarkable church. The lofty Norman tower, with its rich doorway (and Flemish ironwork thereon) and pretty grouping of belfry windows, is particularly interesting. The church on plan has two aisles and north and south transepts, and a room over the west end of south aisle, which is rather unique. Stones denoting the graves of Knights Templar are to be seen in the church.

R. A. Easdale, A.R.I.B.A.

LINCOLN CATHEDRAL CENTRAL TOWER, ETC.

The central tower was rebuilt, having fallen down about the year 1237 A.D., during the time of Bishop Grosseteste, who carried it up to the height of the two lower stages in the purest of Early English Gothic. The upper story, begun in 1307, under Bishop Dalderby, and finished in 1311, is of extremely rich Late Decorated work. The present open battlement was erected by Essex in 1775 A.D. To William de Blois, 1203-9 A.D., is attributed the west side of the great transept and the Galilee porch. The nave was continued by his successor, Hugh de Wells, who also erected part of the west front. Chas. H. Holden.

CHIPS.

The new Roman Catholic church which has been erected on a commanding site in Penydarren Park, near the entrance to Brecon-road, Merthyr, was opened on Thursday in last week.

The Bishop of Manchester consecrated on September 27th Christ Church, Westham, in the parish of Kirkham. The edifice is built of brick, with Runcorn stone dressings, and has been erected at a cost of £3,000. There is seating accommodation for 300 worshippers.

The new schools erected in connection with All Saints' Church, Wolverhampton, were dedicated last week by the Bishop of Shrewsbury. The site for the schools was given by Lord Barnard, and the buildings will increase the accommodation for nearly 1,000 children. The contract was carried out by Mr. H. Gough, from the plans of Messrs. Veall and Son.

Mr. Rienzi Walton, C.E., held a Local Government Board inquiry at the town hall, Crewe, on Friday, with respect to the application of the Crewe Town Council to borrow £8,377 for purposes of street improvement, £500 for the erection of lamp columns, £150 for department and market purposes, and £2,500 for the making and improvement of Minshull New-road. Mr. G. Eaton-Shore (borough surveyor) explained the proposals.

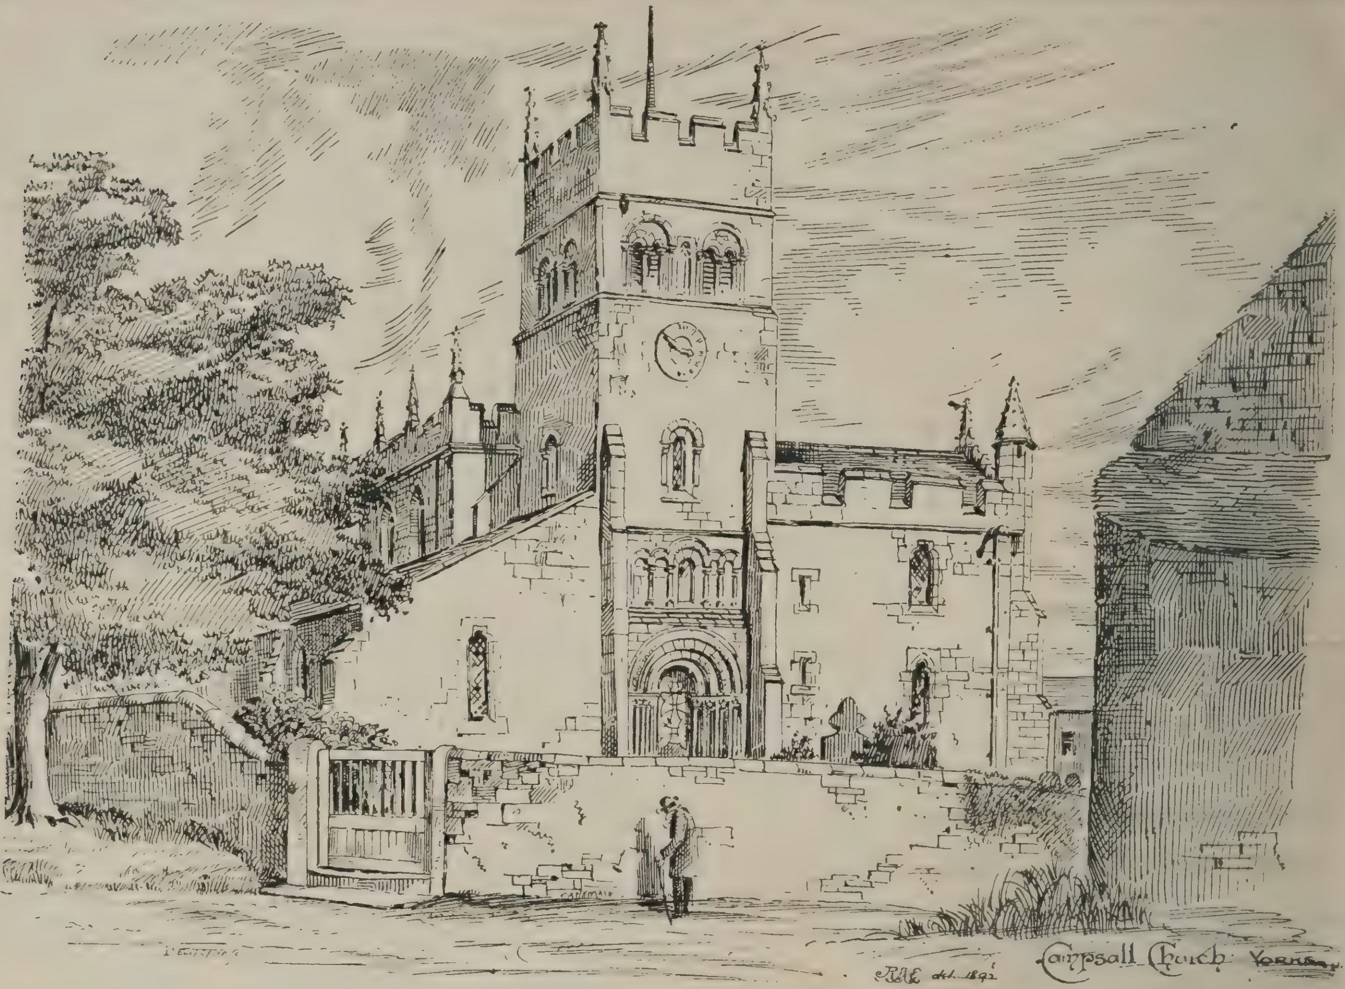
A portrait by Hoppner has lately been added to the Louvre, as well as a landscape attributed to Louis Moreau, a portrait of a man by Cranach, a Flemish picture of the 16th century representing the Virgin seated on the ground with the dead Christ upon her knees, and drawings by Monnier and L. Boivin.

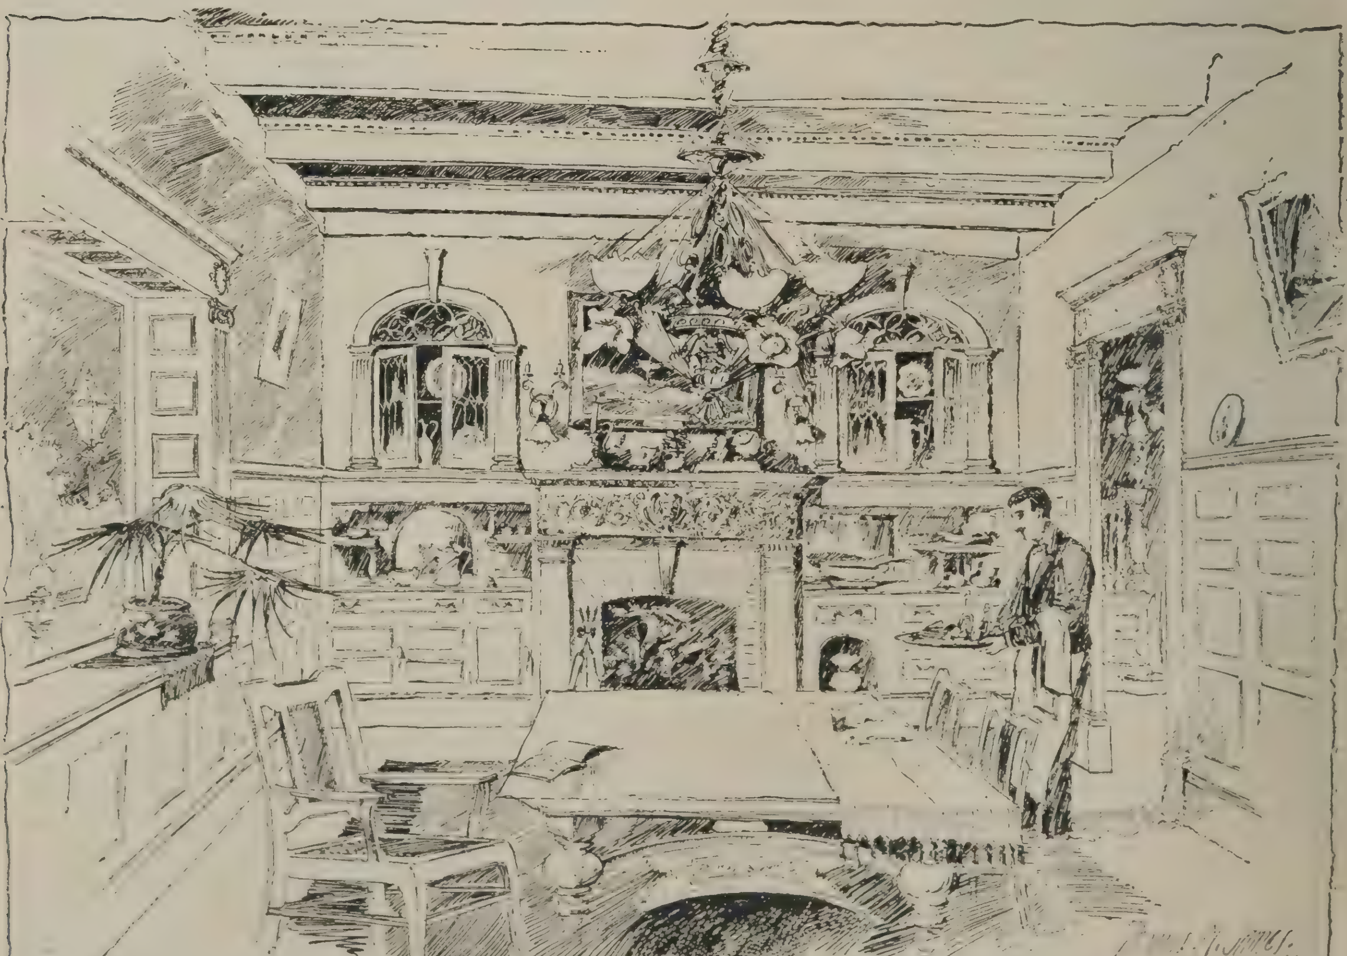
The memorials to the late Professor Jowett will take the forms of a life-size bust (for which Mr. Hope Pinker has been commissioned, and to be placed in the Bodleian Library) and a monument, to be erected in the chapel added to Balliol College many years since from Mr. Butterfield's designs.

On Thursday in last week the Bishop of Southwell consecrated the new chancel of the restored church of the Holy Rood at Edwalton. The work has been carried out from the designs and under the superintendence of Mr. Arthur W. Brewill, of Nottingham. A double-page illustration was given in the Building News for June 23, 1893, showing the old church and the restored fabric, with plan.

The subscriptions towards the rebuilding of the Swansea parish church at a cost of £24,000 now amount to £7,075, and the vicar announces that this, with £2,000 which he himself will lend and £4,500 which he and Sir John Llewelyn have guaranteed, will bring the funds up to such an amount that as soon as £425 more has been subscribed the work will begin.

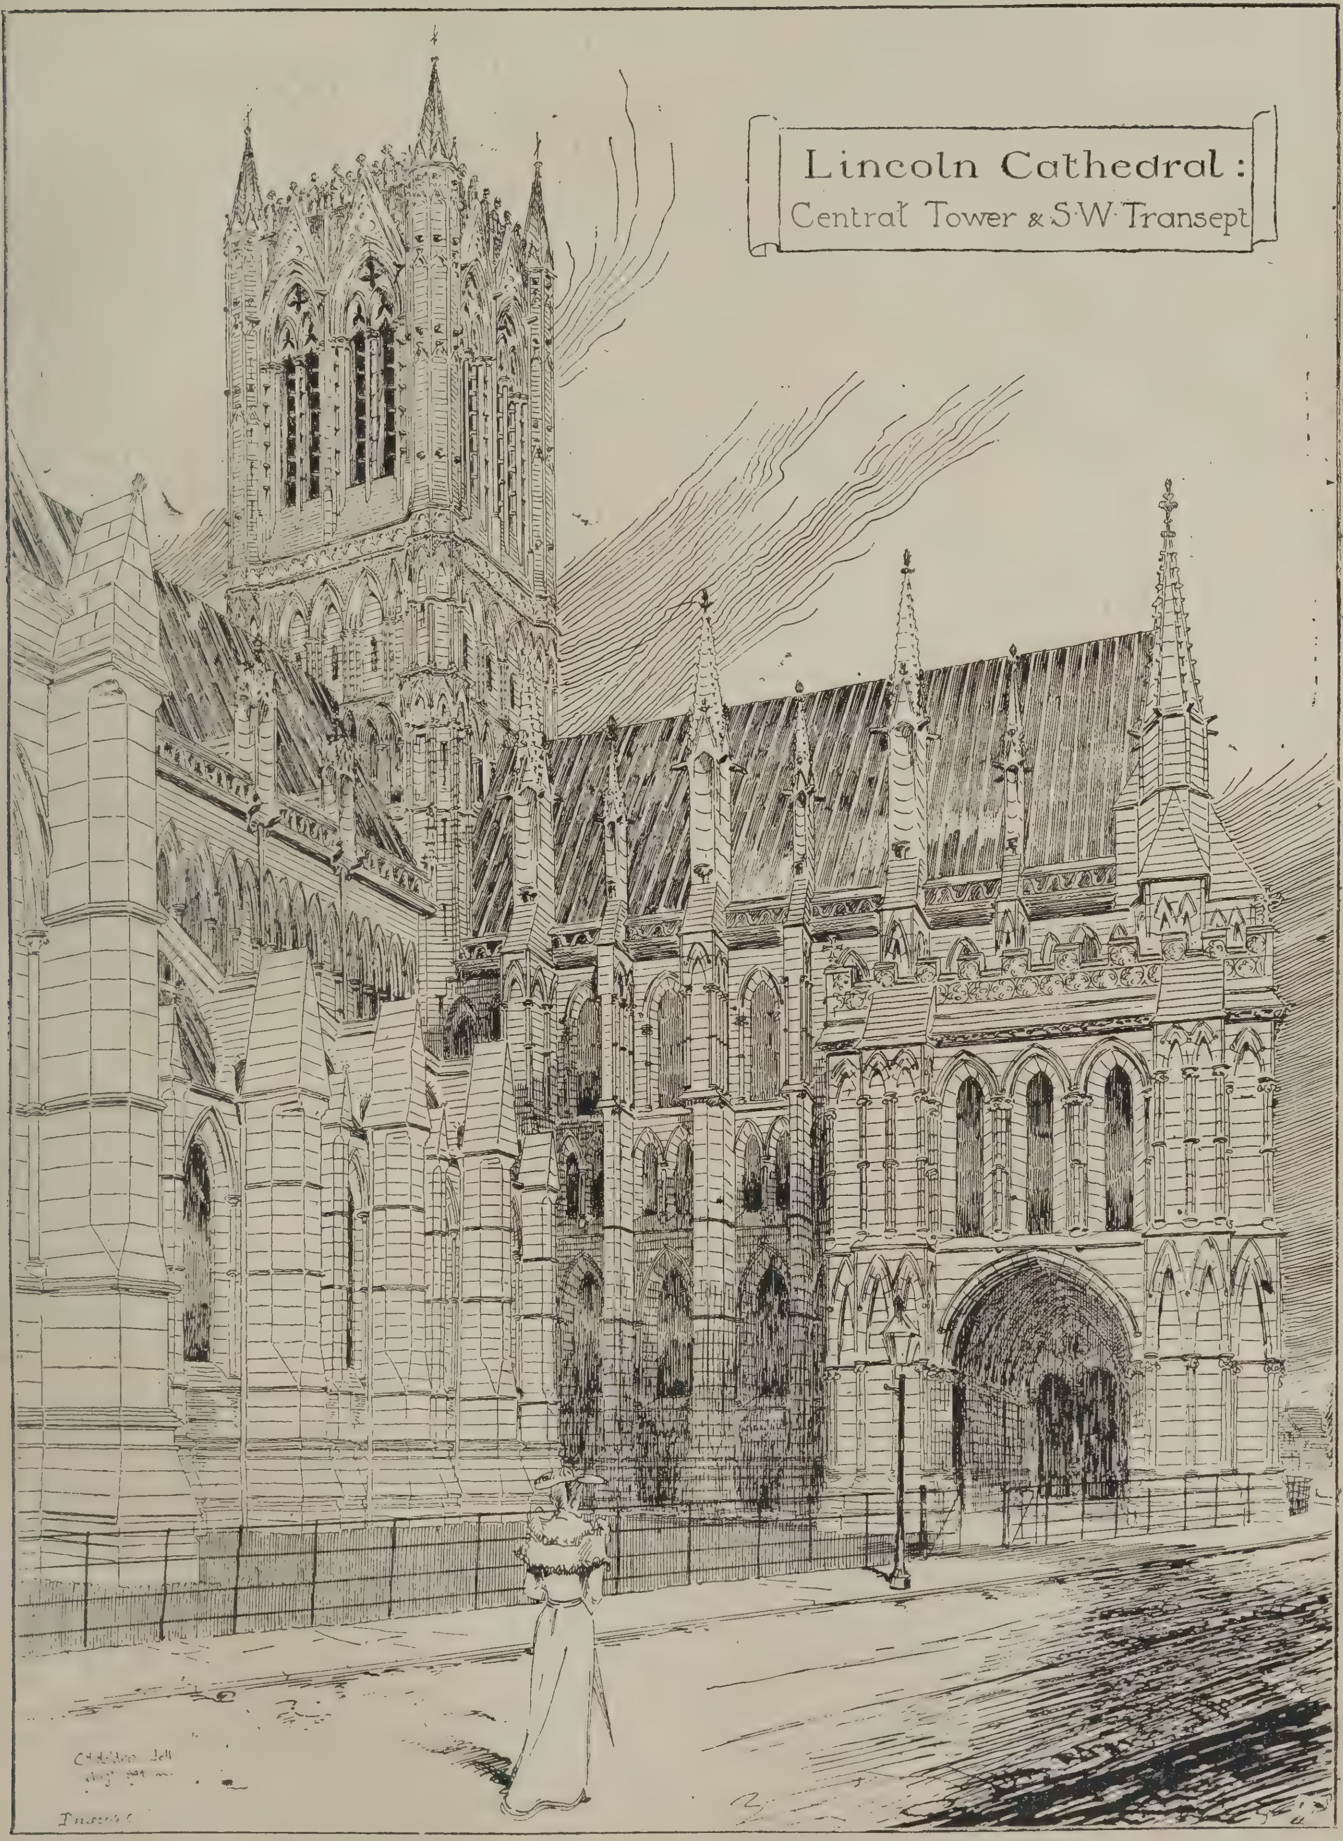
At the Quarterly Court of the Plumbers' Company, held at Guildhall on Saturday, the Master (Alderman Sir Stuart Knill) took the oath as Master on his re-election to office for the ensuing year, and Sir Philip Magnus and Mr. Philip Wilkinson were sworn into the offices of Warden and Renter Warden respectively. A return was presented of the examinations held by the company under their syllabus of practical and theoretical instruction for plumbers, showing that the examinations for the current year had been held at 24 centres in the United Kingdom, and that the percentage of passes in the preliminary grade of the examination was 30, as compared with 49 in the previous year; and the passes in the intermediate examination were 30 per cent., as compared with 63 per cent. in 1893.





DINING-ROOM IN THE HOUSE OF J. H. GIBBS, BROOKLINE, MASS.

EUGENE L. CLARK, Architect.



Lincoln Cathedral :
Central Tower & S·W·Transept

WAYSIDE NOTES.

It was a kindly thought of the proprietors of the Holborn Restaurant to inaugurate their magnificent new "King's Hall" by a "house-warming" to the workmen engaged on its construction, between five and six hundred of whom were sumptuously regaled at a banquet therein last Saturday night. The new "King's Hall" has four entrances and exits from Newton-street, Holborn, and a covered way along the whole of its passage for the accommodation of guests. Fitted throughout with every modern refinement, it is certainly, architecturally, one of the grandest rooms in London for its purposes, and its formal inauguration on the 10th inst. will be a feature of the season. The spirited enterprise of Mr. F. Gordon, of the Hotel Syndicate, has been ably seconded by the admirable administrative ability of Mr. T. J. Hamp, the managing director, and the artistic instincts of Mr. T. E. Colcutt, the architect, and the result is one of which the proprietors may be proud, and the general public are to be congratulated. As Mr. Colcutt, who occupied the chair last Saturday night, remarked, good workmanship has been encouraged in every department, and the outcome is equally creditable to the genius of the architect, the enterprise of the proprietors, and the conscientious skill of the craftsman.

The maiden effort of the committee who organised the Photographic Salon in the Old Dudley Gallery last autumn was so far a success, that the second exhibition has just been opened to the public, and I think the promoters are to be congratulated on the character and artistic merit which the gathering certainly maintains. Whether, however, many of the exhibits illustrate the legitimate aims of the photographic art without exceeding its more strictly defined limitations, must remain an open question upon which very few people are likely to agree. I for one cannot help thinking many of the pictures are by far too much manipulated to deserve approval, either as pictures or as honest productions of the camera. The "impressionist" school, which makes its home year by year in the same gallery, seems to have impressed the type of work most in favour in this ingeniously-designated "Photographic Salon."

"The flexibility and range of adaptability of photography, in contradistinction to the attributes of mechanical accuracy and subservience to scientific fact," in rather "tall" official language expresses the ideas which govern the end in view of those who have brought about these pictorial displays with an idea of illustrating the powers of the camera as a personal art. The more serious and meritorious efforts, resulting from this worthy endeavour, to my mind encroach too evidently on the results insured only by the pencil of the water-colour painter to deserve unqualified commendation. Mr. H. P. Robinson's series of prints, however, are no doubt most admirable, as in "The Storm Clearing Off," though its companion, "Ready for the Collier, Morning," is an ugly subject, only remarkable for the sky effects embodied in the picture. Mr. Ralph Robinson's print well realises its name, the "Foggy Thames," and the chill of the air is more than suggested by his "Frozen Out" scene. This effect is due rather to the incidents in the picture, which a rough sketch would, I fancy, have far better depicted than this elaborated photogram.

Colonel Gale never seems to outreach the restrictions of true photography. I hardly know which of his five exhibits please me most. "A Corner of a Surrey Common," anyway, is a pretty piece, well representing his good taste in the choice of subject and his personal style. Mr. Craig Annan is chiefly interesting because of his selections for his camera records. "A Veronese Vineyard" and "A Lombardy Pastoral" among his landscapes, and "The White Friars," one of his subject pictures, seem deserving of mention. The Macaque Monkeys, "Companions in Arms," by Mr. Gambier Bolton, like his "Martial Hawk Eagle," are "Zoo" studies, at once true to nature and to the photographic art, without any tricks and unworthy manipulations.

The silhouettes by Mr. Rowland Briant degrade photography to the level of shadow profiles, such as our grandparents had cut out of themselves in black paper, relieved by gilding. Surely the committee do not wish this sort of thing revived by the "flexibility" of the camera? Among the good portraits—and there are many in the gallery—is one by Mr. Ralph Robinson of Mr. G. F. Watts, R.A., and two or three child studies by Mr. H. H. H. Cameron; but the nude study by Mr. J. S. Bergheim, from Vienna, entitled "The Penitent Magdalene," is ungraceful, and postured too much after the fashion of an "Old Master," without success. Mr. F. E. Evans sends a well-lighted photograph of that over-belauded eccentric draughtsman, Mr. Aubrey Beardsley, who, with an "Emma" fringe to his hair, has posed his head in the most ungainly attitude with a view, of course, of being peculiar, and in order to gain notice by braggart "side." The most novel work in the gallery hangs in the doorway. It is an intaglio of a handsome boy's head in profile, done in plaster by Mr. Cameron, under the misleading title of Photo-Sculpture. As a photogravure it has undoubted merit, and hung well with regard to the light, the features are rendered with singular luminosity.

Mr. Buggins is going to join the Liberty and Property Defence League. The interference of magistrates is becoming intolerable. Mr. Charles Marsh, builder, was told that his work was unsatisfactory, and that his mortar was mixed with mould instead of sand. Whereupon Mr. Marsh defied the authorities and their representative to interfere with him, as he had "purchased the land," and could erect what buildings he liked on it. The consequence was a summons to appear before the magistrate at the West London Police-court. There the whole matter was made public, with the result that the offender was heavily fined, with an alternative of three months' imprisonment. Even in court Mr. Marsh could not understand why he could not build in any way he liked. His wife was even more indignant that disconnected drains, bad mortar, and plans which had not received official sanction should meet with any objection on the part of the local board.

This is the period of the year when, since the tourist is abroad, and presumably interested in the antiquities of the district he visits, appeals are widely distributed for funds to continue the excavation of Roman sites. Mr. J. C. Kenward, F.S.A., of Birmingham, is asking for aid in opening out the Romano-British city of Uriconium, near Wroxeter, Salop. Little or nothing has been done with the spade there for the past twenty years, although Uriconium was no mean city. The walls have been traced in a circuit of at least three miles, and it is known that the remains of numerous buildings lie within their area. Throughout the last century and in the earlier part of the present desultory researches were occasionally made around a fragment of the old wall, which has stood above ground for 1,500 years. But it was only in 1859 that a serious and systematic exploration was begun, under the direction of the late Mr. Thomas Wright, and with the concurrence of the Duke of Cleveland. The basilica was then discovered and a portion of the public baths. The extramural cemetery was traced. Human bones, pottery in various styles, coins, and implements were unearthed in abundance. Mr. Wright's valuable book and the Shrewsbury Museum contain ample records of these excavations and of the results. But funds ceased to come in, and the greater part of the small uncovered area had to be restored to its agricultural level. Since then the work of exploration has been almost wholly neglected, and the preservation of what has been excavated is very imperfect.

Then the vicar of Cardiff asks also for "several hundreds of pounds" to continue the excavation of a Roman villa on the Ely Racecourse near Cardiff. The villa was discovered by Mr. John Storrie, late curator of the Cardiff Museum, who has been engaged for the past two months in conducting preliminary excavations on behalf of the Cardiff Naturalists' Society. The articles discovered are of the usual class for a site dwelt upon in pre-historic, British, and Roman days, including flint arrow-heads, large quantities of tesseræ, fragments of Samian ware and black pottery, a considerable quantity of coloured and figured wall-plaster, Roman coins of various dates, fibulæ, and broken glass.

Rather a happy description of the effects of river pollution was given at the Sanitary Congress at Liverpool on Friday by Mr. W. Spinks, the lecturer on sanitary engineering at the Yorkshire College, Leeds. He asserted that the Mersey and its tributaries are "a sort of cross between a sewer and an ashpit." The remedies he suggested for the blocking up of streams by refuse were of an heroic character, and included the paving of the entire bed of a river, so as to form an inverted channel during the dry weather flow—a pleasing prospect this for the dwellers on the banks of the said streams, but hardly so attractive to the contributory ratepayers.

As I anticipated, the alarmist paragraphs concerning the impending failure of the water supply to Leicester, which have filled the big-gooseberry void in the daily papers during the past fortnight, have much exaggerated the facts, although they had a substratum of truth. Owing to a diminished rainfall for the past three years, the reservoirs at Leicester have, the Chairman of the Corporation Water Committee states, had a severe strain placed upon them. The storage capacity of the present Leicester reservoirs is 889,000,000 gallons of water, and at the average consumption of 17 gallons per head of the population, is capable of supplying a population of 235,000 persons. The population at present supplied with water is estimated to be 206,480. In 1890 the corporation obtained Parliamentary powers to acquire land and raise capital for the supply of water from another watershed, and the construction of an additional storage reservoir capable of holding 550,000,000 gallons, estimated to supply a population of 100,000 persons. These works are in course of construction, and when completed the corporation will have, with an average rainfall, a water supply equal to the demand of a population of over 300,000. The rainfall of the district has, however, fallen from an annual average of 28in. to under 22in. in 1893, and in the present year, to the present date, about 15½in., of which less than one inch fell in September.

The Leicester corporation took steps in the autumn of last year to obtain an auxiliary supply of about 400,000 gallons per day from a spring near one of the large collieries situated about 12 miles from Leicester. This supply has been pumped into one of the storage reservoirs since the end of December last. In addition to this, water from additional springs upon the site of the new reservoir has been pumped into one of the reservoirs since May last. The present stock in the reservoirs amounts to 109,000,000 gallons, and the corporation engineers and the medical officer of health feel there would be no danger to public health in bringing that water down a further 20,000,000 or 30,000,000 gallons from each reservoir. In addition to this, arrangements have been made with the owners of four large mills who have deep wells, the average depth of which is 175ft., and they have consented to the corporation taking from these wells all the water they can spare. This water, which is very hard, will be added to the supplies from the reservoirs, and is expected to yield 500,000 gallons per day. The engineers of the corporation are also sinking two deep shafts, and water from this source is also expected soon to be available for the use of the town. It is evident that, although at present economy has to be used, Leicester has no permanent cause for anxiety as to its water supply.

◆

The new school built by the London School Board at Shepherd's Bush was formally opened on Tuesday week by Mr. J. R. Diggle, the Chairman of the Board. The building, which will accommodate 474 children, has been erected at a cost of £5,871.

New National schools, Church-walk, Northwich, were opened on Wednesday. They are Gothic in style, and are constructed of brick with red sandstone dressings. The central hall is 48ft. by 33ft., and is flanked by four classrooms, each 24ft. square, while a fifth classroom is 34ft. by 12ft. Accommodation is provided for 420 boys, and the cost has been over £4,000. Mr. M. K. Ellerton, of Northwich, was the architect, and Mr. W. Molyneux, of the same town, the builder.

New carved oak stalls on an oak platform have just been substituted for the deal ones in the chancel of All Saints' Church, Okehampton. Besides the priests' desks and seats, provision is made on either side for six singing men and seven boys. These additions to the church (built originally in 1261, rebuilt in the 15th century, and after total destruction by fire—save the tower—in 1842, again rebuilt from the late Mr. John Hayward's, of Exeter, designs the year after), have been carried out by Messrs. Harry Hems and Sons, of Exeter.

SPECIFICATION WRITING.—II.*

(*Continued from p.* 450.)

BRICKLAYER.—[REFER TO GENERAL CLAUSES.]

Who supplies scaffold? who furnishes water?

Bricks:—For cellar, piers, facing, backing, footings.

What kind and colour? any particular make? how laid? what kind of mortar? If for footings, width, number of courses; what racking?

Bonding:—Old English? Flemish? behind facing? every fifth course headers?

Moulded-bricks:—Make, colour, kind. Catalogue number. Specify all inside and outside returns. Any lead-covering on moulded bricks?

Building-in blocks, strips, frames.

Levelling for joists, sills, frames, heads, plates.

Chases for pipes, flues, posts.

Arches:—Flat, semicircular, arch-head, elliptical, segmental.

Bricks ground or moulded?

Mortar:—Cement?—what kind? with sand? what proportion?

Cement tests:—Boiling, tensile, compression—what fineness? what mesh?

Lime-mortar:—What lime, if any preference? what sand? what proportion?

Coloured mortar:—What colour? any particular make of colour?

Trimmer hearths. Ash-pits. Foundation for range. Bricking of heater.

Fireplaces:—Backs and sides; what kind? state price; any dampers?

Inside hearths; what kind? specify round hole and plate.

Outside hearth; what kind? name price. Omit place in other trade?

Brick finish on face of chimney breast? what brick?

Any porch-piers? columns? any special chimneys? any brick-pavements?

Walls to be built from outside scaffold or overhead from trestles?

Clean walls; oil walls?

Cisterns:—Brick? cemented? man-holes, covers; padlocks? guarantee tightness.

Any fireproofing:—Hollow tile; porous terracotta? brick arches?

Specify sizes.

Any damp-proofing:—Inside furring bricks?

Any damp-proof under walls—asphalt? slate in cement?

Terracotta:—Name of maker; specify parts to be terracotta. Specify straightness, colour, even shade, square joints.

Modelling. Omit? name price?

Old material:—Clean and pile? use headers and bats? to be contractor's? owner's? re-used, or carted away?

Wet bricks before using; how?

Any joist-hangers or sockets? if so, notify bricklayer to build in.

Underpinning, see "Mason."

MOSAIC FLOORS AND WAINSCOT.—[REFER TO GENERAL CLAUSES.]

Name price per foot.

Specify kind and pattern.

Marble wainscot? floors? kind? thickness? finish?

Other marble-work, if any.

Tile hearths? facings? Name price per foot set. Floors, wainscot—mosaic?

CEMENT FLOORS AND PAVMENTS.

Specify method; thickness; who fills to cement level?

Name kind:—Granolithic? metallithic? any other make? require guarantee.

CARPENTER.—[REFER TO GENERAL CLAUSES.]

Does carpenter superintend work? give sizes, heights, &c., from drawings.

Who supplies scaffold for mason? for bricklayer? centres for arches? strips for furring? blocks for finish?

Joists:—Kind, sizes, backing and lining, where used? Porch?

Framing-hangers, double-trimmers, headers, double under partitions.

Framing for hearths, flues, stairways, lifts, skylights.

Bridging, kind; how often? what sizes?

Any hangers or sockets? what kind? whose make?

Joists adzed for tile-floor or mosaic?

Floor cut-in for tile-flooring or mosaic?

Girders:—Kind, sizes; bolted or spiked? framed level? or under joists? cleated?

Mill-construction: — Sizes of beams, material, plank-foor, splined.

Top floor: under-flooring specification.

Posts:— Rough? turned? What kind? any bolsters? any brackets or struts?

Studs:—Material, sizes, double at corners? at openings? Pockets for sliding-doors, line them?

Studs at corners of building:—Material, sizes, braced, what kind?

Heads to partitions? Sizes.

Sill:—Sizes, material, bed in mortar; bolted to wall?

Girts:—Sizes, material; let into studs?

Plate:—Sizes, material.

Sheathing:—Material, thickness; surfaced? matched? laid diagonally?

Sheathing paper:—Kind, trade, thickness.

Rafters:—Sizes, material, framing. Outlookers? rafter-ends cut to shape?

Trusses:—Describe fully with all rods, bolts, plates, shoes, &c.

Purlins, valley-rafters, hips:—Sizes, materials.

Roof covering:—Sheathing, same as above. Paper: kind, trade-thickness. Shingles: lengths, widths, weathering, quality; trade-terms? shapes?

Gutter-strips:—Size; iron-brackets screwed on?

Eaves-troughs:—See "Tinner."

Rough framing for cupolas, ventilators, trap-doors, cellarways, stair-horsings, porch-floors: sizes, material.

Rough doors:—Cellarway, trap-doors, thickness; dressed? matched? battened? hinged? fastenings?

Flooring:—Material, quality, thickness.

Kind: combsawed? blind-nailed? face-nailed? width; matched? scraped? planed-off all over? joints struck? put down after plastering: screwed down over pipes and wires.

Rough-floor under: kind, thickness, diagonal?

Ceilings:—Walls, lined? air-shafts, well-holes, elevator-shafts, dumb-waiter shafts, lined or cased? material; quality; beaded? matched? moulded? panelled?

Stalls:—Material; posts, turned? material. Loose boxes? standing stalls? wood-carpet? parquetry?

MILLWORK (IN CARPENTER).

Cupolas, ventilators. Mouldings, posts, caps, louvres, finials, rails, balusters, cornices.

Box-frames:—Plank-front? reveal; solid heads? jib-heads? yellow-pine sills, parting-strips, sash-beads; veneers on box-faces?

Twin frames; triple frames; double-hung weights.

Outside shutters? outside blinds? thickness, material, hinges, all hardware.

Inside blinds? thickness, material, panelled? rolling-slats? hinges; all hardware.

Rolling-blinds? kind, material; look out for pockets.

Casement-frames:—Thickness; moulded? transoms?

Sashes:—Sizes, material; any jib-head sash?

How hung: with hinges? lead-weights? iron-weights? sash-balances? brass tape? bronze chain? cords?

How fastened? look out for right kind.

Fly-screens:—What make? special? thickness, kind of wire.

Inside-sills:—Kind, material; moulded?

Aprons:—Kind, material; moulded?

Architraves, plain? with band? with cap? Material: any variation through building?

Washboards, sizes, size of cap. Sub, sizes, if any. Material: any variation through building?

Jamb-casings, head-linings: material, plain? moulded?

Rebate-strips? sizes, material.

Boards for pipes:—Material; moulded?

Casing over chases for pipes:—Panelled? screwed; brass-screws?

Shelving:—Material.

Pin-rails:—Material; hooks? wooden pins?

Dressers:—Pantry: with glass doors? panelled doors? hardware; material.

Kitchen: Material, hardware; drawers? cupboards under?

Drain-boards:—Material.

Porches:—Describe fully: mouldings? turnings? brackets? carving? lump sum? name carver? omit? contractor to supply material for carving?

Front-door:—Frame: size, material; panelled-jambs? Transom? moulded? transom sash: thickness, pivoted? hinged? fixed? all hardware.

Doors: thickness, material, moulded? panelled? with glass? double? single? Dutch? [if Dutch, look out]. All hardware? If hardwood, veneered.

Vestibule-doors:—Side-lights? fixed? sash? thickness. Transom, moulded? Transom sash: thickness, pivoted? hinged? fixed? all hardware.

Doors: thickness, material; same as front door? for glass? all hardware. If hardwood, veneered.

Inside-doors hung:—Thickness, material, number of panels; moulded? all hardware.

Closet-doors, same? all hardware. If hardwood, veneered.

Sliding-doors:—Thickness, material, number of panels; double or single? astragal or rebate joint? with edge strips? all hardware. If hardwood, veneered.

Doors to water-closets:—Slat? panelled? short? spring-hinges? all hardware.

Doors to shower-baths:—Slat? panelled? short? spring-hinges? all hardware; material.

Wainscot:—Thickness; mouldings? panels? note carving, if any.

Outside-steps: — Framing, material, moulding, setting.

Cornices, Pediments:—Material, quality, mouldings, brackets; any carving? lump sum? omit?

Stairways:—Back stairs: treads, nosed, risers, string, housings; open string? rail, balusters, posts, mouldings.

Main stairs: lump sum? without horses? without finishing?

Water-troughs: — Material, ploughed-joints? white-leaded? straining-rods?

Feed-bins:—Material; zinc-lined?

Mantels:—Price fixed? omitted?

Elevator-screens:—Material.

Dumb-waiters:—Kind, make; price allowed? omitted?

Sliding sash-partions. Pulpits. Altar. Altar-rails. Pews. Benches. Vestment-lockers. Choir-lockers. Reredos. Hotel-counters. Desks. Bank-partitions. Bank-counters. Counters. Store-fixtures. Show-cases. Bookcases. China-closets. Harness-closets. Picture-mouldings. Ceiling-beams. Panelling. Does carpenter close-in openings with muslin in cold weather before glazing?

PLUMBER.—[REFER TO GENERAL CLAUSES.]

Permits. Sewer-connections. Board of Health rules.

Drain-pipe:—Jointing, cement, sizes, kind; for soil; for rain-conductors.

Is drainage to city sewer? well? flush-tank? who digs? where?

Is drainage Waring's system? done by patentee or plumber?

Soil-pipe:—Size, weight, trade weight or mark; ccated? all fittings; trap, running-trap, clean-out, lead-joints; carry soil-pipes through roof; any anti-siphon pipes? test soil-pipes to 3lb. pressure.

Supply-pipe from main:—Materials, size, joints—wiped if lead, screw if iron galvanised; stop-and-waste; pave wash; if lead-pipe give weight per foot.

Supply-pipes in house:—Sizes, materials, to each fixture; lateral runs below floors; stops-and-wastes on rising branches; tags on faucets; boiler-connection, hot-water-supply, proper supports, brass-ferrules for lead connections, wiped-joints on lead pipe. Pipes exposed? if so, nickel, or bronzed?

Tank:—Wood? cedar, size or number of gallons; number hoops; iron? painted? galvanised? size, number of gallons; overflow; drain, where to? stop on drain-pipe.

Safety-tray:—Lead? zinc? number pounds to foot; waste from same to cellar-floor? to outside building?

Waste-pipes:—Material, sizes; when exposed, nickel-plated brass? lead? give weight; galvanised-iron? cast-iron coated? give trade weight; carry waste through roof, anti-siphon pipes? does waste join soil-pipe? any grease-traps?—brick or at fixture? does waste run separate to well? to sewer?

Traps:—On all fixtures; what kind—"Bennor?" "Cudell?" "Puro?" "Bower?" brass? lead?

---

* A lecture delivered before the Architectural Department of the University of Pennsylvania, by Mr. T. Roney Williamson, Architect.

Fixtures :—Give catalogue page and numbers if possible, and how many of each.

Water-closets :—Include seat and lid? cistern? marble under water-closet?

Bath-tub :—Cased? splashboard? what kind? marble under? what waste? what faucets? sprinkler? silver or nickel?

Washstands :—Iron? marble? exposed? apron, brackets or legs? bowl—oval? round? size; decorated? plain? waste fixture, what kind—silver-plated? nickel? faucets—what make, silver or nickel?

Hip-bath ?—What kind? silver or nickel trimmings?

Shower-bath :—What kind? silver or nickel trimmings?

Pantry-sink :—Porcelain? copper? enamelled-iron? exposed? kind of faucets; make; silver? nickel? brass?

Kitchen-sink :—Size, kind, make, legs? brackets? back? faucets, kind, make; brass?

Stationary wash-trays :—What kind—soapstone? enamelled-iron? porcelain? wood? indurated fibre? with lids? what wood? what faucets—brass?

Urinals :—What kind? make? with marble or slate backs, floors, sides? Automatic, or with faucets? Waste from floors.

Slop-sinks :—Galvanised? painted? enamelled? porcelain?

Any marble or slate inclosures for water-closets? marble floors?

Do washstands stand in rows? marble tops jointed or in one?

Are shower-baths inclosed in marble or slate partitions?

Circulating-boiler :—What make? self-cleaning? on stand? on wall? waste; sediment-cock; galvanised-iron? copper? copper connections? galvanised-iron connections?

Range :—Stationary; who sets? portable? slate-bottom? slate-hearth? zinc-hearth? plate-warmers?

Hotel-fixtures ;—Broilers, boilers, steam-cookers, plate-washers, mangle, washing-machines, hot-tables?

Gas-piping :—Permits. Comply with Gas Company's rules and regulations. Test system. Cap outlets. Pipe to grade to meter connection; stop-and-waste. No drops in pipe to outlets. No cutting of joists at greater distance than one foot from bearing. Measure for all outlets to centre of ceilings or heights and position on walls. No pipe smaller than ½in. Specify sizes of mains and branches. Are pipes to be exposed?

Any hot-water heaters :—Who supplies? who connects—heater-contractor? or plumber?

Any stable? bell-traps, stalls, gutters.

Hydrants with stop-and-waste below frost?

TINNER.—[REFER TO GENERAL CLAUSES.]

Roofing :—Flat-joint? standing-groove? cleated? tinned nails?

Quality of tin, branded? IC? IX? painted? what kind of paint? paper under, what quality and make, trade thickness.

Flashings: continuous, width; broken? sizes, around chimneys, nailed? bonnetted?

Around skylights, carried-up under galvanised-iron or under sashes, if wood.

Trap-doors, up rim, tacked to top edge, over scuttle down sides of rim.

Gutter-strips: Twenty-inch tin, same quality as roof, brought once over edge of strip, tacked, paper under, same as roofing. Cut for rain-conductors.

Eaves-troughs: Quality tin? bead-edges? hung level? hung with grade? kind of hangers.

Rain-conductors: kind, size, quality, trade thickness, connect with gutters, wire-balls; do conductors connect with terracotta pipe or discharge on ground? proper shoes.

Heat-boxes :—Quality tin, bright tin, cleated, stayed, sizes, collars for registers, for heater-pipes, for radiator-boxes, asbestos-paper around studs, wire-lathing over boxes, dampers, boxes double?

Registers :—Does tinner supply or does plasterer or heater-contractor? kind, sizes.

Tin shingles :—Any particular make? painted two coats when on.

PLASTERER.—[REFER TO GENERAL CLAUSES.]

Lathing :—White-pine? spruce? hemlock? free from bark, sap. Wire-lathing? stiffened?

Other lathings: Dovetail iron? expanded metal? Are outside walls stripped? Wire-lathing over heat-boxes, or does tinner do this?

Mortar :—Lime, any make?

Sand, for brown coat? bar—? road? creek? bank—? screening.

Hair, cow's hair, fresh. Run mortar two weeks before using.

Kind of plastering :—Two coat? slip coat? three coat? with scratch coat, brown coat, and finish coat? white coat? white sand. Sand float? white sand? Lath and brown coat cellar ceiling.

Plastering free from cracks, blisters, wind, marks of float. Must stop, or is heat provided in cold weather? Who provides heat? does plasterer set registers? crocks for stove-pipes with caps and setting.

Ornamental-plastering :—Cornices—enriched? centre-pieces? panels? moulded? enriched? coved ceilings? Arches or arch moulds? soffits?

Patent-plasters :—What kind? make? guarantee?

Fire-protection :—Over beams, over columns, woodwork, what kind?

GALVANISED IRON.—[REFER TO GENERAL CLAUSES.]

Cornices, crestings, finials. Weight of iron or No. gauge; painted before setting inside and outside. What paint?

Skylights :—Hyatt's patent? ventilating? condensing? glass? does painter supply? ventilators, attachments for handling, rods, levers, cams, shafts, cog-connections. Show shapes on drawings; flat? pitched one way? hipped? gabled?

(*To be continued.*)

CHIPS.

The members of the Bradford School Board at their last meeting accepted tenders for the erection of Byron-street Higher School, amounting to £12,137. The total accommodation will be for 1,214 scholars, and the total cost, including site and caretaker's house, will be £18,400. The total cost per head works out at £16 12s. 7d.

The personalty of the late Mr. Deputy Hammack, an architect long in practice in the City, has been sworn at the net sum of £9,839.

The roll of the Institution of Civil Engineers, corrected to September 6th, shows that there were then on the books 19 honorary members, 1,837 members, 3,597 associate members, and 358 associates, making a total of 5,811. The class of students which is attached to the institution, but does not form part of the corporation, now numbers 782.

Mr. James Stabler, of Darlington, manager of the North of England School Furnishing Company, died on Sunday week. Mr. Stabler, who was born in 1833, was the leading member of the Methodist New Connexion in Darlington.

A new organ, which has been erected in the parish church, Wrexham, at a cost of £1,000, was opened on Friday.

Several of the directors of the London and South-Western Railway Company visited Southampton one day last week by special train from Waterloo and inspected the works in progress connected with the new station at Southampton West, and the contract for the erection of which has been secured by Mr. Lovatt, of Wolverhampton.

The Budget speech for Western Australia proposes that the sum of £120,000 shall be devoted to public buildings, and £47,000 to roads and bridge. A mint and a public observatory are to be established. During the past four years the population of the colony has increased by 64 per cent.

Sir G. Macpherson Grant laid, with Masonic honours, on Friday the foundation-stone of a new iron bridge across the Spey at Kingussie, which is to replace an old timber structure. The new bridge is of the lattice girder order, is of three spans, each 80ft. in length, with a clear roadway of 14ft. The foundations are laid on cylinders sunk 16ft. below the bed of the river. Over these, piers of masonry have been erected, and the iron girders are about to be placed in position.

A memorial font was dedicated in Verwood Church on Michaelmas Day. It is Early English in style, and octagonal in form. It is constructed of veined marble, the columns and base being of Devonshire marble, and the spiral cover is of oak. Messrs. Adye and Adye, MM.S.A., of Bradford-on-Avon, the architects of the church, designed the font, which has been carried out by Messrs. Harry Hems and Sons, of Exeter.

The town council of Monmouth on Monday ordered the official seal to be affixed to agreements with Messrs. Bramwell and Harris, C.E., and Mr. Charles N. Lailey, C.E., London, for preparing plans and specifications and superintending the work of a combined scheme of drainage and electric light in the borough at an estimated cost of £17,600—£12,000 for drainage, and £5,600 for electric light; the corporation to pay the engineers 5 per cent. on the total outlay, find a clerk of works, and pay for advertising and out-of-pocket expenses.

COMPETITIONS.

Burnley, Lancashire.—In a limited competition for proposed new Congregational church and school extension in Hollingreave-road, Burnley, the committee, with the assistance of their assessor, Mr. E. O. Dawson, F.R.I.B.A., of Lancaster, awarded the first premium to Messrs. Hitchon, Son, and Lancaster, architects, Burnley; and the second to Mr. J. T. Landless, architect, Nelson. The school extension is placed under the chapel, and consists of eight class-rooms and one larger room, with the necessary conveniences. The chapel proper will be 72ft. by 45ft., with shallow transept at the north end and gallery over the south end. The seating accommodation is reckoned at about 650. The committee have already met and instructed the architects to prepare the working drawings.

Eisteddfod Pavilion, Llanelly.—Arrangements for the National Eisteddfod for 1895, to be held at Llanelly, are proceeding. Among the new prizes offered for competition by the National Eisteddfod Association is one for the best design for a practical and workable movable permanent pavilion, suited to the requirements of the National Eisteddfod in North or South Wales, with complete specifications, approved estimates, and full incidental details. The prize offered is £25, and the adjudicators are Messrs. Rhys Davies, Brecon; W. E. Davies, Beaumaris; and Charles Evans-Vaughan, F.R.I.B.A., London. The second competition added to the list is for the best panel, grained to imitate wood, size of panel 30in. by 14; prize, a medal, value £3 3s. Copies of the programme may be obtained from the secretary, Mr. William Wilkins, Greenfield Villas, Llanelly.

Major J. A. Ferrier, D.S.O., of the Royal Engineers, has been appointed Assistant Director of Military Works in India.

At St. Helen's, Lancs, on Tuesday, Col. Gamble, C.B., laid the foundation-stone of an institute which is to form a central library and reading-room and a school for technical education and manual instruction. He gives the site, and will spend £20,000 on the building, which is being erected from designs by Messrs. Briggs and Wolstenholme, of Blackburn, and was illustrated in our issue of August 31st last.

The awards to exhibitors at the Antwerp Exhibition were made known on Tuesday. Great Britain and its Dependencies receive 21 grand prizes, 42 diplomas of honour, and 105 gold, 79 silver, and 46 bronze medals. Among the awards is one to Messrs. Harry Hems and Sons, of Exeter, for ecclesiastical furniture and carving.

The foundation stone of a new Wesleyan chapel at Corby Hill, Cumberland, was laid on Friday. The building is Gothic in style; the chapel will seat 200 persons, and the school 100. A partition can be removed, making the school and chapel into one. The work is estimated to cost about £300. The contractor for building is Mr. Gill, Ainstable, and for joiners' work Mr. Bell.

New premises erected facing the Corn-market, Penrith, for Messrs. Hetherington, general merchants, were opened last week, when an electric light installation was turned on, being the first introduced into the town. The buildings have been erected at a cost of over £3,000, and have been built from plans by, and under the supervision of, Mr. H. Higginson, M.S.A., of Carlisle, the contractors being Mr. W. Grisenthwaite for builder's, joiner's, and slater's work, and Mr. Joshua Dixon for plumber's, plasterer's, and painter's work.

At a meeting of the Spalding Waterworks Company, on Saturday, it was announced that, under the supervision of Mr. Isler, a new bore well had been successfully sunk at Bourne, from which place Spalding obtains its water supply. The bore was driven to a depth of 134ft., and would yield a supply of 3,480 gallons per hour, or over five millions of gallons per day. It is proposed by the board to lay new mains from Spalding to Bourne in order to make the supply available. It was stated that this was the largest yield of water of any bore well in England.

Mr. T. Codrington, C.E., on behalf of the Local Government Board, held an inquiry on Monday into the application by the Llandudno town commissioners for authority to borrow £18,000 for sewerage extension. Evidence was given by Mr. Stevenson, C.E., borough engineer, and other witnesses. Mr. Codrington subsequently sat as arbitrator in the question as to the sum per mile to be paid by the county council of Carnarvonshire for the maintenance of the main roads within the commissioners' district. Evidence was given by Mr. Evan Evans, the county surveyor, and by Mr. Thomas, C.E., county surveyor of Buckinghamshire.

Building Intelligence.

Coventry.—The old banking premises belonging to the London and Midland Bank (and formerly the Coventry Union Banking Company), situated at the corner of High-street and Little Park-street, Coventry, have been pulled down, and new premises are now in the course of erection by Mr. Charles Haywood, jun., Coventry, from the designs of Mr. Frank Barlow Osborn, architect, Birmingham. The new buildings, which will be in the Elizabethan style of architecture, will comprise, in addition to the banking premises, a suite of let-off offices, situated on the ground floor in Little Park-street, and a bank manager's residence on the first and upper floors. The buildings, which will be executed in white Hollington stone, red bricks, and roofed with tiles, are now being rapidly proceeded with.

Perry Barr.—The church at Perry Barr, near Birmingham, was reopened by the Bishop of Lichfield on Saturday, after the addition of transepts to the building, and substitution of an open roof for the plaster ceiling over the nave. This work really forms a portion of the restoration and enlargement scheme undertaken in 1887. The other portion of the work, which was completed six years since, comprised the addition of a chancel, organ-chamber, and vestries, the east end of the edifice being previously terminated in a recessed space. The roof which has now been substituted for the ugly ceiling is on the truss-rafter principle. Another feature of the work is the removal of the unsightly west gallery, and the opening out of the tower to the nave by the introduction of an arch. The nave measures 78ft. by 26ft., the chancel 36ft. 6in. by 20ft., whilst the aisles project 12ft. north and south. The work has been carried out from the plans of Mr. J. A. Chatwin, of Birmingham, and the builders engaged were Messrs. Collins and Godfrey, Tewkesbury.

Newcastle-on-Tyne.—The restored premises of the Literary and Philosophical Society, Newcastle, which have been closed since the destructive fire which followed and marred the centenary celebration in February, 1893, were formally reopened on Monday. The work has been carried out from plans by Mr. Frank W. Rich, of Newcastle. The new roof is a double one, the upper one being of plain iron work glazed with rough plate-glass, and below this three iron-framed domes with a depth of 2ft. 6in., glazed with glass bent to the form of the dome. The plaster-work, instead of being attached to laths in the ordinary way, has been attached to iron network, and put up in sections. The entire floor of the first floor has been removed and replaced by a fireproof one, with steel girders and concrete, and paved with oak blocks. The roof over the upstairs committee-room, though not injured by fire, has also been reconstructed. Open fires have been abolished, and the whole premises, except the lecture theatre, warmed with hot water. The lecture theatre is heated with steam, and new ventilating arrangements have been provided. The whole building is now lighted with the electric light. The works have been carried out by the undermentioned firms:—For the iron roofing, the fireproof flooring, and the oak floor, Messrs. Homan and Rodgers, of Manchester; for the steel domes in the ceiling, Messrs. Wenham and Waters, of Croydon, London; for the general work in restoration, Mr. Walter Baston, Newcastle; for the plumbers' work, Messrs. Emley and Sons, Limited, Newcastle; for steel girders, Messrs. Dorman, Long, and Co., Middlesbrough; for plasterer's work, Mr. William Ferguson, Newcastle; for heating, Messrs. Dinning and Cooke, Newcastle.

Pontypridd.—The new public abattoirs erected by the Pontypridd local board were formally opened on Thursday in last week. The new building occupies 1,765 square yards, on the tramroad side near the railway station. The site necessitated a large outlay in the erection of foundations, so that the total cost of land and building will approach nearly £12,000. The abattoirs have been erected from the designs of Mr. Edward Rees, surveyor to the local board. Mr. James Allan, of Cardiff, was the builder, his tender for excavations and masonry amounting to £5,435, while the ironwork was constructed by Messrs. George Kyte and Co., also of Cardiff. The buildings and boundary walls are built of native dressed stones. The main structure is divided into two floors, the ground-floor being entirely set apart as a pig slaughter-house, surrounded by a series of sties and pens. This apartment measures 71ft. by 43ft., with head-room of 13ft., and contains six tanks, three for hot water and three for cold. There also is a hydraulic lift whereby the carcases can be raised to the floor above, and thence conveyed by means of overhead rails and switches to the cooling room. Both on the ground and the first-floor the floor itself is constructed of granolithic pavement. On the first floor are three rooms, each 21ft. 6in. by 39ft. 6in., and a height of 18ft., which are devoted to the slaughtering of sheep and cattle. Adjacent to these, and under the same roof, is a paved yard. The cooling-room, 50ft. by 66ft. 6in., is also on the first floor, and provides accommodation for 300 or 400 carcases. The whole building is lined with white glazed bricks, and the roof is of wrought iron covered with slate. The premises within the inclosure also contain waiting-rooms, lavatories, hay-lofts, and a cottage for the caretaker.

Redditch.—The parish church was reopened last week, after having undergone a complete internal renovation. Plans were prepared last year by Mr. Temple Moore, of Westminster, and the contract of Messrs. Brazier and Son, of Bromsgrove, was accepted, the estimated cost of the undertaking being £5,000. The old barn-like roof has disappeared. In the nave it has been hidden from view, with its ugly rafter, by an arched ceiling, panelled and decorated with bosses. The passages through the nave have been laid with Mansfield stone, and the rest of the flooring consists of red wood blocks. In the chancel, the intervening arches have been brought forward, so that there is more accommodation for the choir, while the heavy rafters above have been removed, and in their stead a groined roof has been placed, at a higher elevation, so as to allow of the addition of a clerestory. The space between the choir stalls has been laid with black-and-white marble squares. Throughout the church has been decorated in a simple style, in keeping with the style of the building. The old chancel screen has been used again, but it is to be replaced by more ornamental ironwork.

CHIPS.

Earl Nelson laid the foundation-stone of a new church at Morgan's Vale, Downton, Wilts, on Friday, to be built in accordance with the Rev. E. Ferryman's bequest at a cost of about £2,000.

The vigorous bronze statue of "The Mower," by Mr. Hamo Thorneycroft, R.A., has been purchased for the permanent collection of Liverpool.

The Republic of San Marino, the smallest state in Europe, inaugurated on Sunday the new Palace of the Government, an edifice erected according to the designs prepared by the architect, Signor Azzurri.

The Walton Lock, which gives access to the Manchester Ship Canal from the river Mersey at Warrington, was formally opened on Monday. The new lock is 229ft. in length, and 30ft. wide, and will contain 10ft. 6in. of water at low water. On the south side there is a 20ft. sluice for flushing purposes. The lock has been in process of construction since November of last year.

The infants' school attached to St. George's Church, Brandon-hill, Bristol, was reopened on Monday, after having been rebuilt and enlarged by 30 school-places. Mr. W. V. Gough, of Bridge-street, Bristol, was the architect; and Messrs. Easterbrook and Sons, of the same city, were the contractors.

The Burlington Fine Arts Club proposes holding an exhibition of Egyptian art and antiquities in the spring of next year. The committee of arrangement has been promised contributions by well-known collectors; but there are many persons possessing collections or single objects of interest who may not be personally known to the members of the committee.

A portrait of the late ex-Provost Watt, chief magistrate of Leith during the years 1866-1875, was presented to the corporation of that burgh on Monday. The portrait, which is the work of Mr. Marshall Wane, Edinburgh, is life-size, on a canvas over 8ft. in length, and represents the deceased Provost in his official robes. It has been hung in the Council-chamber.

The new single-line railway from Seaton to Uppingham, affording access with the North-Western system at Melton Mowbray, was opened for passenger traffic on Monday. The branch is over three miles in length, and has been nearly three years in course of construction by Messrs. W. Radcliffe and Co., of Huddersfield.

Engineering Notes.

Bangor.—Bangor was on Saturday *en fête* in commemoration of the acquisition by the city council of the ferry rights from Garth Point to the Anglesey side of the Menai Straits, and of the passing of the Parliamentary Bill for the construction of a pier and landing-stage. The pier will be constructed a little to the west of the present landing slip, and will consist of cast-iron screw piles and columns supporting a steel superstructure of braced web girders, upon which will be fixed transverse steel joists, carrying the longitudinal timber joists, to carry the transverse deck planks. The length of this portion of the structure will be 1,500ft., the clear width being 24ft. for a length of 1,335ft., then opening out at the head to a width of 100ft. The span of the main girders is 50ft. between centre to centre of the columns, and at the clusters and at the head the spans are all of 20ft. The main piles and columns are 12in. diameter outside. Beyond the pier, instead of having the usual fixed timber landing-stage with landings at different levels approached with steps, it is proposed to have a floating stage, consisting of an iron pontoon 80ft. long by 18ft. wide, with timber deck. The floating stage is approached from the pier deck by a bowstring girder bridge of 120ft. span, and with a clear width of 7ft. 6in. The cost, including dredging, will be £15,000. The works have been designed by Mr. John J. Webster, M.Inst.C.E., Victoria-street, Westminster.

Society of Engineers.—At a meeting of this society, held at the Town Hall, Westminster, on Monday evening, Mr. George A. Goodwin, president, in the chair, a paper was read by Mr. T. W. Baker, B.A., on "The Utilisation of Town Refuse for Generating Steam." The refuse referred to is the usual contents of the ash-bin, with street sweepings and sludge, that is collected by the various local authorities, the disposal of which has been for years a growing source of expense. The recognised means of disposal is now by fire, so destroying all germs of disease and the heat set free by the process of destruction, the author reasoned, should and can be utilised. The large bulk of 420 tons per week, collected from an average vestry area, necessitates a special furnace or destructor, while the noxious fumes arising have also to be destroyed. Up to the present time this has been imperfectly and unsatisfactorily done, most of the heat having been allowed to go to waste. The author submitted his new system as meeting the difficulties, and the results deduced from his calculations and experiments showed that, after paying for the plant, working expenses, depreciation, interest and redemption, a net saving of £2,666 per annum could be obtained on a plant capable of dealing with 420 tons per week. The author claimed that his scheme is particularly applicable to the generation of electricity by the steam, providing a means for heat-storage arrangements to meet the fluctuation in demand; and that for pumping, baths, and washhouses, it is equally applicable.

* * *

A reredos of alabaster and stone was unveiled at Melksham parish church on Sunday. It incorporates the Caen stone wings of a reredos erected two generations since; it measures 8ft. 8in. wide, and rises to a height of 10ft. 6in. It has been designed by Mr. Charles E. Ponting, F.S.A., of Lockeridge, Marlborough, and carried out by Messrs. Harry Hems and Sons, of Exeter. The super-altar is of Staffordshire alabaster, the statues and groups of sculpture are of white Castellino marble, and the fabric generally is of Painswick stone. The style chosen is 15th-century English Gothic, and the subject of the three panels, which are treated as one composition, is the Nativity.

An inquiry was held at the Guildhall, Hereford, on Friday, by Colonel C. H. Luard, R.E., with reference to an application made by the town council of Hereford to the Local Government Board for sanction to borrow the sum of £3,800 for works of water supply, and £300 for provision of gas mains. The city surveyor, Mr. J. Parker, explained that the existing waterworks were opened in 1856, and cost £35,000, and increased pumping power was seriously needed. The proposed new plant would be capable of lifting 2,166 gallons per minute, or 1,300,000 gallons per day of 10 hours. The waterworks committee proposed to construct a new engine, engine-house, engine and boiler, and such connections with the suction and rising mains as would enable the whole of the existing engines and machinery to be held in reserve.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Manchester Society of Architects.—The first meeting in the session of 1894-5 was held at 36, George-street, on Monday evening, when the president, Mr. John Holden, F.R.I.B.A., F.S.I., delivered his address to the members. After reviewing the proceedings connected with the reconstruction of the society in 1891, which had resulted in a large increase in the membership (now numbering 135), he paid a tribute to the memory of those gentlemen who had been removed from the roll of members by death—viz., Messrs. John Elgood, Joseph S. Crowther, William Charles Tuke, James Maxwell, and Lawrence Booth; also of Mr. J. H. P. Leresche, barrister-at-law and stipendiary, who had for the last ten years occupied the position of honorary legal adviser to the society. The council had nominated Mr. William Goldthorpe, barrister-at-law, as Mr. Leresche's successor, and he had accepted the appointment. After briefly touching upon the questions of competitions, of builders depositing priced quantities for works to be carried out, and other matters, he said that he hoped before long to see a Chair of Architecture founded at the Victoria University; this would be a great advantage to the students, and he advised them by increased efforts to show that it would be appreciated by them. He then addressed the senior members, strongly urging them to contribute to the education of the younger members by reading papers, by giving information on matters connected with the profession, and by supplementing the books in the library, and referred to the very generous gift of books by Mrs. Whitaker, the relict of the late William Wilkinson Whitaker, architect, of Manchester. In addressing the younger members, the president urged them, by careful study, to qualify themselves to in their turn carry on the work which had for the last thirty years been going on, and which had given the society the first place out of London. The president afterwards delivered the prizes awarded to the students for work during the past session. The principal prize, of books of the value of ten guineas, for the most satisfactory progress made by the society's students in the architectural classes arranged by the council with the committee of the technical school, was awarded to John Ormrod; and the second prize of five guineas was divided between William S. Beaumont and Alfred R. Parker. The other prizes went respectively to A. E. Corbett, J. C. Dewhurst, Isaac Taylor, and T. W. Hoolley.

ARCHÆOLOGICAL.

Wallsend.—A correspondent writes:—The search for Roman remains at Wallsend has been for the present abandoned. What the members of the Newcastle Society of Antiquaries were anxious to learn was the point at which the wall diverged from the Roman station of Segedunum at Wallsend, and as several relics of the Roman occupation were recently unearthed in the vicinity of the ancient camp, Mr. Spence, treasurer of the Newcastle society, and other members, visited the ground, and entered into an agreement with Mr. Gainer, a builder, on whose property excavations for the foundations of new dwellings were being carried out, to the effect that the trenches should be widened, and the remains of the Roman works laid bare. The workmen first came upon a stone 3ft. square, and about 15in. in depth, which seems to have formed the basis of the pillar of the central arch at the south-west entrance to the camp. Part of a hand millstone was also unearthed, and several pieces of Roman pottery. The chief point of interest has been the uncovering of the foundations of the ancient wall over the entire width of 9ft., thus confirming the impression held by the members of the Newcastle society, that its junction with the camp was on the south-west. In consequence of the close proximity of the remains of the wall to Neptune-road and the adjoining property, the excavations had to be discontinued on Friday, after which the uncovered works were photographed.

* * *

The award of the arbitrator in the recent arbitration between the Cheltenham corporation and the corporation of Tewkesbury, as to the charge for supplying the latter authority in bulk, was made known on Monday. The arbitrator decides that the charge shall be 7¾d. per 1,000 gallons. Cheltenham asked for 10d., and Tewkesbury offered to pay 6d. per 1,000 gallons.

Intercommunication.

QUESTIONS.

[11221.]—**Fibrous Plaster Refuse.**—Could any reader kindly suggest how the clean refuse of fibrous plasterwork can be disposed of to advantage?—Platrier.

[11222.]—**Cologne.**—An exceedingly fine church or cathedral is being built just off Freiheits Strasse, at Deutz. Have any particulars or illustrations of this building appeared in any of the professional papers? Or can any of your readers furnish any?—W. J. M.

[11223.]—**Back-to-Back Houses.**—Will some one give a sketch plan of this class of artisans' dwellings, as built at Leeds, and rightly or wrongly commended by Mr. A. M. Fowler at the Sanitary Congress at Liverpool?—W. J. M.

REPLIES.

[11213.]—**Tall Mill Chimneys.**—Consult Bancroft's "Tall Chimney Construction" (Calvert, Manchester), in which several mill chimneys are described.—G. H. G.

[11214.]—**Safe Load.**—The crushing strength of bricks joined with half cement and half sand on a pier 13½in. by 12in. by 9in., is 299lb. per square inch, according to John Grant's experiments; but no two authorities agree. In stone lime the crushing resistance might be taken as one half of the foregoing for stack brick. (See D. Kirkaldy's work.)—G.

[11220.]—**Electric Lighting.**—So many elementary treatises and textbooks have been published on electric lighting, that it is difficult to recommend any one handbook. As practical guides to fitting, F. C. Allsop's "Practical Electric Light Fitting" (Whittaker) and Urquhart's "Electric Light Fitting" (Lockwood) may be consulted. For elementary purposes, Swinton's "Elementary Principles of Electric Lighting," a little book by Verity, and many other books may be studied. But for the general requirements of an architect I do not know of any one book to recommend, as so many of the textbooks and handbooks are compiled by electricians and others for the purpose of advertising themselves and certain appliances, and are filled with illustrations of apparatus that are lent by manufacturers and engineers in the trade.—G. H. G.

CHIPS.

At Newton, Lanarkshire, a Roman Catholic school-chapel and presbytery, built from plans by Mr. Joseph Cowan, have just been opened.

The new Primitive Methodist chapel in Stratford-road, E., was opened on Sept. 27th. The building is in the Gothic style, measures 62ft. by 42ft., and will accommodate about 400 people, classrooms and vestries being added. The contract has been carried out by Messrs. Atkin and Green, of East-road, West Ham.

Bishop Barry unveiled, on Tuesday, two memorial windows and a mosaic panel which have been been erected at St. Augustine's, Highbury New Park, in memory of the late Rev. Prebendary Gordon Calthrop.

Alterations are being made to the Albert Institute, Windsor, embracing the ventilation, which will now be effected on the Boyle system, the latest patented improved form of self-acting air-pump ventilators being adopted for the extraction of the vitiated air.

The West Ham school board have adopted plans by their architect, Mr. J. T. Newman, for new schools for 1,000 children, to be built in Whitehall-place.

The partnership heretofore subsisting between A. C. D. Hicks and W. H. Alton, architects, surveyors, house, land, and estate agents, Bexhill, under the style of Hicks and Alton, has been dissolved.

At a meeting held at Donington, near Spalding, on Friday, Mr. Bicknell was appointed surveyor to the Black Sluice Commissioners, a Lincolnshire drainage authority. There were 95 applicants for the post, rendered vacant through the resignation of Mr. James Lancaster. The post, with other appointments which follow, is worth £300 per annum.

At the opening of the Public Library for Walthamstow (illustrated by us last week), by Mr. Passmore Edwards, on Saturday afternoon, Mr. Edwards said that hitherto when a public library was opened in London it had been his privilege to present 1,000 volumes, and he would do the same for Walthamstow. Dealing with the selection of books, Mr. Passmore Edwards advised his hearers always to read the best. During the last few years he had presented to public libraries between 50 and 60 thousand volumes, and it was a pleasure to know that more than half were constantly in the homes of the working men.

New offices and works are about to be built for the Reading Electric Supply Company, Limited, from plans by Mr. F. W. Albury, architect, of that town. The whole of the stonework, comprising heavily moulded sills and heads, cornices and pediments, circular windows, finials, &c., is to be supplied in buff concrete masonry from the works of Messrs. Fambrini and Daniels, Lincoln.

Legal.

BUILDERS' BANKRUPTCIES.

THE Bankruptcy Report for the year 1893 shows that builders generally have been having a bad time. There has been an increase in the total number of failures everywhere, but the building trades seem to have been especially unfortunate. The whole of the bankruptcies of all kinds for the year 1893 came out at 4,874, as against 4,635 for 1892, thus giving an increase here of 239. But the rise is even greater in the matter of deeds of arrangements, where the total of 3,333 for 1892 was increased to 3,938 in 1893, making an advance of 605. In other words, the year's insolvencies are in number 844 more than in 1892. We cannot give the number of builders and contractors who failed; but the report contains a table showing the increase in the total liabilities for various trades during 1893 as compared with 1892 and 1891. From this we find that the building trade comes second, grocers and provision dealers being first, and farmers third.

The total liabilities in the building trades failures, both by bankruptcy and under deeds of arrangement, came to £734,726, which gives an increase of £107,932 over the corresponding total for 1892, and that again was higher than the total for 1891 by £103,860. Putting the two together, we have the very heavy total increase during the past two years of £211,793. Evidently the breaking-up of builders and contractors has been considerable, and we fear we have not yet reached the bottom of this depression. The Report contains comments upon two cases of contractors' failures, which are instructive, at all events, if not entertaining. In one the debtor was a builder, brickmaker, and contractor, and at the date of his failure he had contracts in hand amounting to about £450,000. His capital got locked up in large houses, which he could neither let nor sell. He had to raise money on mortgage at high rates of interest and heavy expenses. The mortgagee stopped supplies, and so he came to grief with over £55,000 liabilities, and assets of very "uncertain value." In another case practically the same story is repeated: no free capital; all obtained on mortgage as he went along; engaged in large building speculations, and failing for the third time; liabilities over £33,000, and assets that may possibly bring in £5,000.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

Doubtful.—Drains.—Closets.—It must depend upon the Act and regulations that apply to this district, which is not stated. Generally speaking, the sanitary inspector has very wide powers, and can compel the doing of the things which are here required.

* * *

The Archbishop of York opened on the 27th ult. the new High School for Girls, belonging to the Church Schools Company, at Hull. The building was formerly the Hull and East Riding College, and since its acquisition by the company it has been enlarged and altered at a cost of £1,500. Accommodation has been provided for 300 pupils.

New board schools in Wrotham-road, Gravesend, were formally opened last week. They have been built from designs by Messrs. Cobham, selected in competition, and consist of two departments for girls and boys, each including a schoolroom, 40ft. by 20ft., to accommodate 80 scholars, and two classrooms, each 30ft. by 20ft., for 60 children. The infants have a schoolroom, 40ft. by 20ft., for 88 infants, two classrooms, 30ft. by 20ft., for 75 each, and a babies' room, 20ft. by 20ft., for 50. The cost of the building, exclusive of cost of site and of furniture, is under £7,000.

Electric lighting is making progress in Leeds. The works of the Yorkshire House-to-House Electricity Company were formally opened in Leeds in May, 1893, with a capacity of 600 I.H.P. The number of 8c.p. lights now connected is over 15,000, and the mains extend about eight miles. Additional plant has therefore become necessary, and is now being laid down at the company's station in Whitehall-road. The engine-house has been extended in length from 68ft. to 124ft., the width remaining 63ft. The Leeds corporation are arranging terms for a two-years' supply of the light to the Town Hall and Municipal Buildings, and also for street-lighting, and for the illumination of City-square and public markets.

LEGAL INTELLIGENCE.

In re Mrs. Turner, Cardiff.—A meeting of creditors of Mrs. Jane Turner, builder, Manor-street, Heath Estate, Cardiff, was held at the official receiver's, Cardiff, on Sept. 27. The statement of affairs gave the gross liabilities at £1,106 6s. 7d., of which £306 6s. 7d. was expected to rank. The assets amounted to £100, leaving a deficiency of £206 6s. 7d. She alleged that the cause of her failure was inability to sell her property at its value. No resolution was passed, and the official receiver remains trustee.

Heavy Fines for Building Offences.—At the West London Police-court on Saturday, Charles Marsh, of Chiswick-lane, was summoned by Mr. R. F. Finnis, clerk of the Chiswick Local Board, for offences alleged to have been committed in the erection of a building. There were three summonses: for not giving notice of an addition to his building, covering up drains without inspection, and using bad mortar. Mr. Ramsden, the Board's surveyor, said plans for a stable were sanctioned; but he found that additions had been erected, the place occupied, and the drains not connected. A sample of the mortar was produced by Mr. Ramsden, who said it was mixed up with mould instead of sand. He told the defendant he could not pass the work, but he said he did not care for him or the local board, that he had purchased the land, and should do as he liked. Mr. Curtis Bennett thought it was a bad case, and said it was a proper thing to stop what he called jerry building. He fined the defendant in each summons £5, with 2s. costs, or one month's imprisonment—in all £15 6s.—with the alternative of three months' imprisonment.

CHIPS.

Some large new stables are just being completed for Sir Peter Walker, Bart., at Osmaston Manor, Derbyshire, and the large clock has been erected by John Smith and Sons, Midland Clock Works, Derby.

The Rhondda and Swansea Bay railway line is to be completed in about a month's time.

The London County Council has decided to set apart a certain portion of their establishment at Spring Gardens for the reception of any relics of ancient London which they may come across in the carrying out of public works, or the demolition of old buildings. These, it is hoped, will form the nucleus of a very interesting collection, similar to that at the Guildhall, and will no doubt be steadily added to from time to time.

The directors of the South Kensington Museum have recently purchased from various private collections several hundred pieces of wrought-iron work, representative mainly of early German manufacture.

A stained-glass window, representing "Abraham Entertaining the Three Angels," has been placed in Winkleigh parish church, Devon. Mr. F. Drake, of the Cathedral Close, Exeter, carried out the work.

The chancel of Middlewick parish church is about to be restored from plans by Messrs. Douglas and Fordham, of Chester. The works will include the raising of the east window and the addition of two side lights, new window on south side, the tiling of the sacrarium, and a new reredos.

The town council of Folkestone have decided to light the town by electricity at a cost roughly estimated at £12,000, and have instructed Mr. Medhurst to prepare plans, estimates, and details at a retaining fee of 50 guineas.

Messrs. Andrews have offered the corporation of Hertford the encaustic tiles found in the foundation of the old church of St. John discovered some time ago on their premises at the Priory Wharf. The gift has been accepted, and the tiles will be put into a glass case at the public library.

A new branch bank for Lloyds has been opened this week at Stokes Croft, Bristol. The façade is of Doulting stone, with brickwork in the upper portion. Mr. H. J. Williams, of Bristol, was the architect of this and four other branches of the same company's bank, and Messrs. R. Williams and Son, of Surrey-street, Bristol, were the contractors.

Messrs. Jones and Willis have recently completed three stained-glass windows for St. Clement's Church, Fulham. The subjects are: The Light of the World, Hope, and the Presentation in the Temple. The work has been carried out at their studio, 43, Great Russell-street, London.

The Queen's Theatre at Longton, Staffs., was destroyed by fire on Friday. The building originally cost £15,000, and was a stone structure, having shops next the street, and offices above. It was built in 1887 from plans prepared by Mr. John Taylor, Mr. T. S. Bromage being the contractor, and about four years ago extensive alterations and decorations were carried out at a further cost of £5,000. The origin of the fire is a mystery. The directors have decided to rebuild as soon as possible.

WATER SUPPLY AND SANITARY MATTERS.

Oldham.—On the invitation of the engineers, Messrs. Henry Law and Son, London, the members of the Sanitary Congress made an inspection on Saturday of the works in course of construction at Oldham for the treatment of sewage. The works have been in progress for about a year, and other two years will be needed to complete them. The whole cost will be about £200,000, of which about £70,000 is for land. The outfall works are at Slack's Valley, Foxdenton-lane, some distance outside the boundaries of the borough. Here the corporation have purchased 72 acres of land. There are about ten miles of intercepting sewers, which range in diameter from 15in. to 6ft. A considerable portion of the outfall sewer is completed. When the sewage reaches the outfall works it will receive chemical treatment, and then flow into the tanks, twelve in number, each 125ft. long, 30ft. wide, and 6ft. deep, where it will be allowed to settle. The effluent, when drawn off, will pass over filtration beds, and then be allowed to flow into the stream. The sludge will probably be pressed and disposed of as manure. The committee have not yet decided what chemicals will be used for precipitation. Oldham has at present a population of 130,000, and the scheme is designed for a population of 250,000, allowing 35 gallons per head and a rainfall of $\frac{1}{4}$in. in twenty-four hours. The existing sewers in the borough will be used to run off storm-water. A novel feature of the scheme is the extent to which concrete is used. All the sewers over 2ft. in diameter are being made of concrete blocks, which are manufactured at the outfall works. The settling tanks are also being constructed of concrete. The work is being done by the corporation without the intervention of a contractor, the engineers undertaking the supervision.

Edinburgh.—At a meeting of a sub-committee of the Works Committee of the Edinburgh and District Water Trust, held on Friday, Mr. Wilson, engineer to the trust, submitted a supplementary report, in which he showed in detail the comparative merits of the Talla or Tweed scheme and the St. Mary's Loch scheme, concluding by recommending that the Tweed scheme should now be fixed upon as an additional source of water-supply for Edinburgh and district. This concurred with the advice given by the three consulting engineers called in. The committee passed a resolution recommending the adoption of the Tweed scheme. They propose that the tunnels and aqueducts should be constructed to carry 24 million gallons of water per day; that the pipes be laid capable of conveying 10 million gallons per day for a first instalment; that the construction of the Menzion tunnel be deferred until more water than 8 million gallons per day is required from the Talla, which will reduce the cost of the first instalment to £631,371. In order to give the trustees a *locus standi* in Parliament for the purpose of the Bill, Parliamentary notices will be given and the plans lodged forthwith, subject to the ultimate approval of the scheme by the corporations, and the engineer and Parliamentary agents have been instructed accordingly.

Macclesfield.—The town council have, after a long and animated debate, decided to apply to the Local Government Board for power to borrow £60,000 for main drainage and sewage disposal works. A proposal to engage the International Company to treat the sewage was rejected by 22 votes to 6, the council's opinion being that it was premature to decide as to the treatment until the constructive works were completed. Mr. W. H. Radford, of Nottingham, is the engineer. His estimate was £65,000, but the borough surveyor's estimate of £60,000 was adopted.

Parbold.—The township of Parbold was put in possession of a public water supply on Monday. The provision has been made by the Parbold Parochial Committee, acting in conjunction with the Wigan Union Rural Sanitary Authority. By tapping a spring in a park and constructing in the millstone grit of the hill, 205ft. above sea level, a covered reservoir, a supply sufficient for the needs of the present population, and for 150 per cent. increase has been obtained. The reservoir has a capacity of 60,000 gallons, and will afford 11,500 gallons every 24 hours, or equal to a supply of seven gallons per diem per head for two-and-a-half times the present population, which was 630. Provision has been made to apply filtration whenever considered desirable. The total cost has been £1,300.

◆

A fresh illustration of the necessity that exists that architects should specify and carefully inspect the erection of temporary platforms for memorial-stone-laying ceremonies is afforded by the accident that occurred on Wednesday afternoon at Plymouth during the ceremony in connection with the formal commencement of building a Wesleyan schoolroom. The staging collapsed, and 50 persons were thrown a depth of 14ft., 26 of them being more or less injured, some sustaining broken limbs.

Our Office Table.

The Metropolitan Building Act, 1894, will form the principal subject of Professor Roger Smith's lectures to his class for Modern Practice, at University College, London, in the session about to commence. "Discoveries in Architecture" is the title of the Free Public opening lecture with which Professor Roger Smith will resume his classes at University College, London. The lecture is to be delivered on Thursday evening, the 11th inst., and among the illustrations to be shown by the lantern are photographs of the remarkably fine Greek sarcophagi discovered at Sidon, but now removed to the Museum at Constantinople. These objects are enriched profusely with fine sculpture and architectural ornament.

The Director of the French School at Athens reports to the French Minister of Public Instruction, that the work at Delphi, resumed on March 14, is progressing very favourably. Excavation is being carried on at three points on three different levels—the temple of Apollo, the treasure-house of the Athenians, and the Hellenikon or great retaining-wall of classic times. The number of workmen employed is 220, and the earth is carried away by a light railway. The Apollo temple has not yet been entirely cleared away; the foundations have been laid bare to a considerable extent, as well as part of the *peribolos* or sacred inclosure, but very few architectural fragments and no decorative remains have yet come to light—not a single metope, relief, or recognisable portion of the pediment. Only some carved lion-head waterspouts of the cornice, the drums and capitals of columns (all of porous stone, with traces of stucco coating) have been unearthed. There has also been found the pedestal of the statue of Victory, erected, according to the accompanying inscription, by Gelon, tyrant of Syracuse, after his great victory at Himera; the treasure house of the Athenians, with numerous reliefs representing the deeds of Herakles and Theseus, and many official inscriptions; the treasure-houses of the Bœotians and of the Siphnians, the former containing numerous relief-carvings; and the Hellenikon. Among the single remains are a Kerkyræan bull, two marble horses life-size, mutilated statues of Apollo and of athletes, and reliefs representing sacred dances. Inscriptions have been discovered in great numbers. Some new fragments bearing musical notation have been discovered within the past fortnight, and are thought to be supplements to the mutilated portions of the Apollo Hymn discovered last autumn.

Classes have been arranged between the Council of the Manchester Society of Architects and the Technical School Committee of that city for the instruction of students in architecture. A regular course, extending over two years of instruction in architecture, building construction, and modern practice, leads up to the examination for the Associateship of the Royal Institute of British Architects. The lectures are delivered on the afternoons of the Mondays and Wednesdays, between the hours of 2 and 5. The society has issued a circular to every architect practising in Manchester, urging the desirability of impressing upon pupils the necessity for their attending these classes, in which they will receive that instruction which it is impossible for a busy professional man to find time to impart to them, and at the same time requesting the employers to allow their pupils to have these afternoons at their disposal so as to enable them to attend.

The London County Council considered on Tuesday a report from the Public Health and Housing Committee as to the provision that should be made for washing and drying the tenants' clothes on the Boundary-street area, Bethnal Green, who had come to the conclusion that a common laundry was preferable. The superintending architect had submitted a plan of the proposed building, the site of which lies in Turville-street and Charlotte-buildings, showing 42 washing stalls and as many drying houses. The estimated outgoings and receipts showed an anticipated annual deficit of £392 18s. 3d., representing an additional rent of $\frac{3}{4}$d. per week per room. On the other hand, by abandoning the laundries in the dwellings, a capital outlay of £13,125 would be saved, equivalent to a saving of an annual expenditure of £700 13s. 9d., or $1\frac{1}{4}$d. per week per room. The total gain therefore to the tenants would be ½d. per room. After some discussion the recommendation of the committee was adopted, and instructions were given for detailed drawings to be prepared.

The autumn exhibition at the Castle Art Museum, Nottingham, for the present year, takes the form of the works of the essentially modern Cornish schools of painters. Mr. G. Harry Wallis, the art director of the Nottingham Gallery, has brought together over 220 representative works by members of the Newlyn, Lelant, Falmouth, St. Ives, and other colonies of artists in West Cornwall, and has published an illustrated catalogue of the exhibition. The display, which was opened on Friday, is a remarkable one, and will be of much value to the student and the general public. A new system has been adopted in hanging, the works of each artist being grouped together. Landscapes and seascapes, of course, predominate; but there is a good sprinkling of *genre* and impressionist works. The place of honour is occupied by Stanhope Forbes's "Forging the Anchor," and he is also represented by "The Village Philharmonic." From the Chantrey Bequest comes Frank Bramley's "Hopeless Dawn," Chevallier Tayler's clever effect in lighting, "A Dinner Party," and his "Departure of the Fishing Fleet from Boulogne," and "Confirmation Day" are worth notice; and other prominent contributors are Alfred East, Walter Langley, T. C. Gotch ("Crown and Sceptre"), H. S. Tuke ("The Bathers"), C. Napier Hemy (river and canal scenes from Venice and Putney, and two fishing incidents), Adrian Stokes, Mrs. Marianne Stokes ("Hail, Mary!"), Mrs. Stanhope Forbes, Fred Hall, and F. W. Boudillon.

It is proposed to remove the well-known parish church of St. Enoch, at Glasgow, from its present position in St. Enoch-square "to some locality where it may be of greater benefit." Subway and other operations have cracked its walls, and as it would take a very considerable sum to execute the necessary repairs, the Presbytery think removal best. A site in New City-road, a district "where church accommodation is much required for the poor," has been suggested. The churches committee of the town council are to make a full report, and the general question of the relations between the corporation and the whole city churches is to be discussed.

In a paper on "Domestic Boiler Explosions and Cylinder Collapses, their Cause and Cure," read by Mr. James Walker, at the Sanitary Congress at Liverpool, on Friday, the author, after tracing the cause of boiler and cylinder explosions to the formation of steam under pressure in the cylinder, and the choking of the relief vents, which were generally in exposed and inaccessible places, described an arrangement by which he considered these evils might be avoided. The water from the boiler, instead of circulating through the whole of the cylinder, is confined to an inclosed portion at the bottom, heating the other water in the cylinder by conduction only. This arrangement allows of the boiler and lower portion of the cylinder being freely ventilated at the low level, so that steam, if produced, would not be a source of danger. The other water in the cylinder and that circulating in the house-pipes, being only heated by conduction, could not produce steam. A siphon feed was arranged for the supply of water to the boiler, to prevent water entering the boiler when empty.

Mr. J. P. Norrington, the surveyor to the Fulham Vestry, is a strong advocate of wood for paving, and in his latest report to his vestry he remarks:—"It is becoming more and more evident that granite macadam is not a suitable material for the formation of carriageways with much traffic in large towns, both on account of the cost of scavenging and the noise of the traffic; asphalte is too slippery for fast traffic, although in the City its cleanliness and durability render it very suitable for the excessively heavy traffic and slower moving vehicles. The hard woods of Australia are both antiseptic and durable, and as the competition becomes more keen every year, a considerable reduction in the price of them may be looked for." Taking into account their evenness of quality and durability, he regards the woods from Western Australia as the cheapest for paving purposes. He gives details showing a considerable saving on contractors' prices by carrying out works of paving under his own supervision.

Some experiments were recently made by the Buildings Inspection Department, Vienna, on the protection of iron from fire by incasing it with brick. A wrought-iron column, 12ft. long, and built up of two channels connected by lattice bars, was used. This was set up in a small chamber constructed of brick, and the column was loaded by levers. This done, it was surrounded by a 4½in. brick wall laid in fireclay mortar. Between the wall were fixed samples of fusible metals, which should serve as a gauge of the temperature attained. Various samples of stone concrete and other materials were also placed in the chamber within the column. This chamber was then filled with firewood, which was lighted, and the doors were walled up. An examination of the room after the fire had burned itself out showed that the walls of brick laid in Portland cement retained their strength, whilst most of the natural stones left in the chamber had been destroyed. The ceiling had been lined partly with plaster of Paris and partly with terracotta tiles. Both were damaged. The inclosure round the iron pillars was still standing firm, though corners of the brickwork were chipped 1in. or so, and the fireclay mortar was largely washed out of the joints. On removing the casing, however, the pillar inside was found to be uninjured, even the paint being unscorched, and the fusible plugs only showed a temperature of 149° Fahr.

◆

MEETINGS FOR THE ENSUING WEEK.

Monday.—Liverpool Architectural Society. Opening Address by the President, Henry Hartley, F.R.I.B.A. 6.30 p.m.

Tuesday.—Royal Society of Antiquaries of Ireland. Meeting at the Royal Dublin Society's House, Dublin. 4.30 p.m.

Thursday.—University College, London. Free public lecture, "Discoveries in Architecture." by Professor T. Roger Smith, F.R.I.B.A. 7.30 p.m.

Friday.—Architectural Association. Conversazione at the Queen's Hall, Langham-place, W. 8 p.m.

◆

The foundation-stone of new Church schools for Wetherby was laid on Tuesday by Colonel Gunter, M.P. The schools, which are from designs by Mr. A. A. Gibson, architect, Harrogate, will cost £1,300, exclusive of land, and will accommodate 412 children. All the work is being executed by Mr. G. B. Thain, contractor, Wetherby.

As a consequence of the tension in the architect's branch of the United States Treasury, resulting from the adoption by a Committee of Congress of the McKaig Bill, by which the designing of all public buildings in the States is to be thrown open to competition by outside architects, Mr. Carlisle, the Secretary of State, has, in a curt note, demanded the resignation of the supervising architect of the Treasury Department, Mr. Jeremiah O'Rourke.

The opening of the Poplar Public Library, situate in the High-street, took place on Wednesday. The site was purchased at the cost of £2,000, and the edifice has been erected for £7,000. The building has been erected from designs by Messrs. J. and S. F. Flint Clarkson, of Great Ormonde-street, W., and High-street, Poplar, and was illustrated in the Building News by plans, elevations, and sections on Oct. 14, 1892. The library contains 7,500 volumes, and shelf-room is provided for 40,000 volumes. Mr. Passmore Edwards contributed 1,000 books.

On Monday there was opened at Swansea a new temperance hall, which has been erected at a cost of £10,000 (including the freehold site). Shops, with suites of offices above, are provided in Gower-street, and the hall itself fronts in Orchard-street. The ground floor is arranged as a coffee-tavern, with dining-rooms, billiard-room, and friendly societies' room. Above is the hall, which has accommodation for 1,400 people. It has a permanent platform and a gallery. The exterior of the hall is of grey polestone, with red sandstone dressings, and the style is Jacobean. The architects were Messrs. Hannaford and Wills, and the contractors Messrs. Gustavus Bros.

In memory of the late Bishop Charles Wordsworth, a tablet bearing a Latin inscription has been recently placed in Thurbern's chantry, in the chapel of Winchester College, of which the late Bishop of St. Andrew's was second master, and for the last 20 years of his life a Fellow. The memorial is fixed below the tablet in memory of the Bishop's first wife. It is of white statuary on a black marble ground, treated in the Later Perpendicular style, so as to harmonise with the architecture of the chantry. It has a cusped four-centred arch with carved spandrels, inclosing the inscription, together with panelled quatrefoils and bands of Tudor foliage. The mitre, with St. Andrew's cross, has been worked in at the top. Messrs. Cancellor and Hill, of Winchester, designed the work, which was executed by Mr. Marsh, of Fulflood.

Trade News.

WAGES MOVEMENTS.

Bristol.—A Building Industries' Federation has been formed for Bristol and District, and a compiling committee has been elected for the purpose of drawing up a final code of rules, to be issued to the various sections of the building trades.

◆

CHIPS.

The Blackpool town council decided on Tuesday to proceed with the widening of the Promenade for a distance of about 650 yards between Station-road and Alexandra-road. Mr. J. Ireland's patent system, which fulfils the dual object of widening the footway and at the same time forming a sand shield, is to be adoped, and the estimated cost of the work is £15,000.

Works are in progress for making a dam across the Coal Burn in Haselton Wood to form a reservoir for an additional supply of water to the thriving Northumbrian port of Blyth. The reservoir will hold twenty million gallons of water, and the contract for its construction has been taken by Mr. Bailey, of Gateshead.

The new reservoir for the city of Bath, now being constructed at Monkswood, is to be brought into use in March, 1896. Mr. Fox is the engineer, and Messrs. W. Neave and Son are the contractors.

The new church of All Saints, Hertford, will be dedicated by the Bishop of St. Alban's on December 21st, that being the anniversary of the day on which the old church was burnt down. The building has been re-erected from plans by Messrs. Paley, Austin, and Paley, of Lancaster, and was illustrated in our issue of January 6, 1893, by a double-page perspective and plan. The arrangements follow those of the old building, the style being Perpendicular, and there being no chancel arch. The outlay has been over £15,000.

Twenty-three competitive designs have been sent in for the statue of Edward Colston, proposed to be erected in Bristol, from sculptors residing at Edinburgh, Manchester, Birkenhead, London, Bristol, and other towns. Eight designs have been chosen for the final selection, to be made next week. The cost of the 23 models in wax and plaster is estimated at over £500, whereas the total amount subscribed for the statue is under £400.

The extensions to the Royal Hospital, Richmond, Surrey, are now nearing completion. A new children's ward, called the "Princess May" ward, has been added, which is being warmed and ventilated by means of Shorland's patent Manchester stoves, with descending smoke flues, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester. The architect is Mr. Frank J. Brewer, of Richmond.

A new church erected at Ynysyfeio, near Treherbert, was opened last week. It is Gothic in style, seats 350 persons, and cost over £2,000.

Mr. R. W. Macbeth's painting "In Clover" has just been presented to the permanent collection of the Walker Art Gallery at Liverpool by Mr. Temple, of Aigburth.

Mr. Codrington, C.E., on behalf of the Local Government Board, held an inquiry at Penmaenmawr, on Tuesday, respecting an application by the local board for a loan of £2,500 for the construction of a road from the railway station. Evidence in support of the application was given by Mr. J. S. Coverley, the surveyor.

The foundation stone of a new Free Church was laid at Gretna on Wednesday week. The church will seat 200 persons, and will cost about £500. The walls will be of red Corsehill stone, and the style will be a simple type of Early English. Mr. T. Taylor Scott, of Carlisle, is the architect, and the chief contractor is Mr. James Rae, of Springfield.

The foundation-stone of Portskerra Harbour, on the west coast of Sutherlandshire, was laid on Wednesday by Lady A. Gordon Lennox.

The Prince of Wales will open St. Saviour's Public Library, Southwark, on November 2. The library is situate at the corner of Southwark Bridge-road and Union-street, and is of an ornate type of Italian. The architect is Mr. John Johnson, of Queen Victoria-street, E.C., whose design was selected in competition just two years ago.

On every hand there are, in Canada, indications of a revival of trade. The settlement of the American tariff question has had a beneficial influence on commerce in the United States, which is extending to Canada. As the result of the free exportation of Canadian lumber into the United States market, we may expect to witness great activity in the manufacture of rough and finished lumber in Canada, and this must have a beneficial influence on every department of trade in the Dominion.

DOULTING STONE.

120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

Ammanford.—For alterations and additions to Bettws vicarage, for the Rev. E. Lloyd. Mr. David Jenkins, F.R.I.B.A., Llandilo, architect:—

Davies, J., Swansea (accepted)	£153	0	0

Belgravia.—For shop fittings, &c., at No. 12, Lower Belgrave-street, S.W. Messrs. Morley and Letts, 185, Earl's Court-road, S.W., surveyors:—

Smith, W. J.	£247	0	0
Whitaker, J.	229	0	0
Drew and Cadman	193	0	0
Williams, T. F., 30, Moreton-place, S.W. (accepted)	189	10	0

Bridgend, Glam.—For the construction of eight miles of railroad on the Bridgend side of the Vale of Glamorgan Railway:—

Woolley, of Wrexham (accepted).

Bristol.—For repairs to machinery at the swing-bridge, Cumberland-basin, for the Bristol Docks Committee:—

Spencer and Co. (accepted)	£123	0	0

Bristol.—For rehanging the peal of eight bells in the tower of St. Thomas's Church. Mr. W. V. Gough, of Bristol, architect:—

Llewellin and Janes, of Bristol (accepted).

Camberwell.—For alterations to Lording's, 156, Denmark Hill, for Mr. Charles D. Tustin. Mr. Percy H. Clarke, 2, Lancaster-place, Strand, London, surveyor:—

Parker, G., Peckham	£1,812	0	0
Evans R. and E., Peckham	1,721	0	0
Burman and Sons, Kennington	1,604	0	0
Parsons, J., Kennington	1,567	0	0
Balaam Bros., Hatcham (accepted)	1,489	0	0

Cardiff.—For the erection of a new mission hall, Grangetown, Cardiff, in connection with the "Cardiff Forward Movement." Messrs. Habershon and Fawckner, Cardiff, Newport, and London, architects. Quantities supplied:—

Davies, D. J.	£3,200	0	0
Firbank, J. H., Newport	2,955	10	0
Dunn, C. C.	2,950	0	0
Griffiths, G.	2,950	0	0
Best, W., and Co.	2,905	14	0
Lattey and Co.	2,865	0	0
Hatherley and Carr, Bristol	2,853	0	0
Trotman, E.	2,837	15	7
Howell, A. J., and Co.	2,836	0	0
Evans, E. R.	2,834	2	9
Wood, T., and Son	2,830	0	0
Shepton. S., and Son	2,785	0	0
Davies, D.	2,778	0	0
Gibbon, H.	2,700	0	0
Rutter, G., Barry	2,647	0	0
Turner, E., and Sons	2,638	0	0
Davies, H.	2,579	0	0
Knox and Wells (accepted)	2,368	0	0

(Rest of Cardiff.)

Crewe.—For the erection of the new church of St. John in the south end of the borough:—

Cotterill, A. P., Crewe (accepted) about £4,000

East Ham, E.—For furniture and fittings for the Shaftesbury-road School, for the East Ham School Board:—

For three revolving shutters:—

Francis and Co.	£108	15	0
Hoskins, S.	94	0	0
Clark, Bunnett and Co. (accepted)	79	18	6

For cupboards and desks:—

Hammer, G. H., and Co.	£67	0	0
Educational Supply Association*	66	6	6
Taylor	65	0	0
Wake and Dean	61	7	6

* Accepted.

Eastleigh, Southampton.—For new roof and additions to the drill hall, Desbrough-road, of the 1st Hants Volunteers, S.D.R.A., for Colonel Bance, D.L. Mr. R. M. D. Lucas, Southampton, architect. Quantities by the architect:—

Jordan, G. B., and Co.	£420	7	0
Stevens, H., and Co. (accepted)	420	0	0

(Both of Southampton.)

Eccles.—For boring a trial hole adjoining the public baths, for the town council:—

Thorn, J., of Patricroft (accepted).

Fulham.—For engineering works, consisting of steam and condense mains, hot-water supply, and warming apparatus, &c., at the Western Hospital, Seagrave-road, Fulham, for the Metropolitan Asylums board. Messrs. A. and C. Harston, 15, Leadenhall-street, E.C., architects:—

Matthews and Yates, Ltd.	£5,312	12	0
Fraser, J., and Son	4,971	10	0
Clements, Jeakes, and Co.	4,500	0	0
Kite and Co.	4,395	0	0
Burn Bros.	4,359	0	0
Christie, J. C.	4,137	0	0
Clarke, J., and Sons	4,099	0	0
Purcell and Nobbs	3,982	0	0
Easton and Anderson, Ltd.	3,965	0	0
May, J. and F.	3,945	0	0
Strode and Co.	3,793	0	0
Brown, Kearley and Co.	3,700	0	0
Sugg and Co., Ltd.	3,625	0	0
Ellis, J. C. and J. S., Ltd., Sheffield*	3,340	0	0

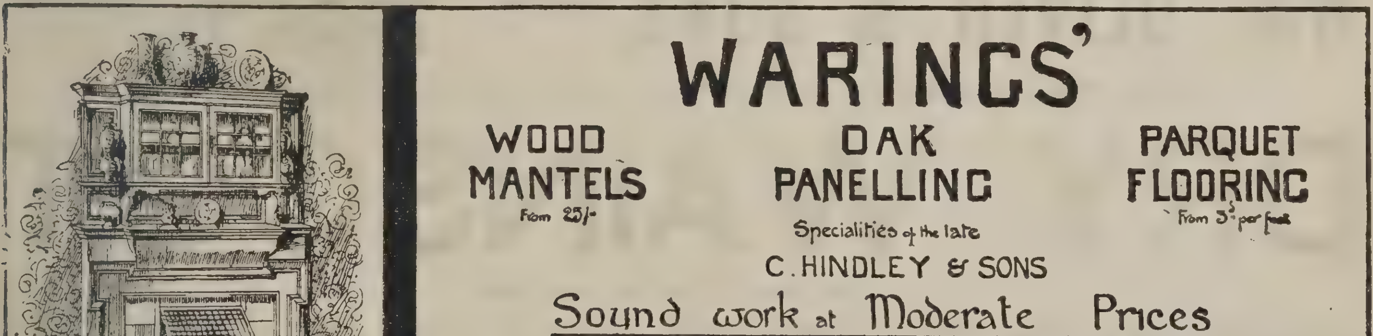
* Accepted.

Grimsby.—For fitting up the chemical laboratory with desks, at the technical school, for the town council:—

Carter, G. (accepted)	£45	0	0

Hanley.—For the erection of a bandstand in the public park:—

Cornes, C. (accepted)	£325	0	0



Hampstead.—For new sanitary items, &c., at No. 27' Belsize Park, N.W. Messrs. Morley and Letts, 185' Earl's Court-road, S.W., surveyors :—

Whitaker, J.	£449	0	0
Gregory and Bence	427	0	0
Head, H.	410	0	0
Myring, J., and Co., 67 and 69, Abbey-road, N.W. (accepted)	395	0	0

Horselydown.—For the erection and completion of an addition to the Anchor Brewery, Horselydown, for Messrs. Courage and Co., Limited. Messrs. Inskipp and Mackenzie, architects. Quantities by Messrs. R. L. Curtis and Sons :

Nightingale, B. E.	£17,850	0	0
Munday and Sons	17,479	0	0
Kirk and Randall	17,000	0	0
Lawrence, E., and Sons	16,500	0	0
Williams, H. J.	15,987	0	0
Watson, W.	15,524	0	0

Ipswich.—For the supply of 138,000 wood blocks (the standard size being 9in. by 4½in. by 3in.) for paving the Butter-market and Fore street, for the town council. Mr. E. Buckham, borough surveyor :—

	Per 1,000.		
Burt, Bolton, and Hayward, Rotherhithe	£5	17	6
Acmé Wood Flooring Company	5	15	0
Christie, F. A., Ipswich	5	12	6
English Brothers, Wisbech	5	5	0
Wade, Son, and Co.	5	2	6
Bennetts and Co., Grimsby	4	11	9
Allen, T. W., Hull	4	2	6

Kensington.—For sanitary and decorative reparations at 101, Earl's Court-road. Messrs. Morley and Letts, 185, Earl's Court-road, S.W., surveyors :—

Rugg, J.	£340	0	0
Whitaker, J.	291	0	0
Edwards and Son	260	0	0
Hancock and Son, 49, Marloes-road, Kensington (accepted)	249	0	0

Lancaster.—For roof over the economiser at the central electric supply station, for the town council :—

Richardson, W. (accepted)	£43	0	0

Llandebie.—For building six workmen's dwellings at Penygroes, for Mr. William Williams, schoolmaster. Mr. David Jenkins, F.R.I.B.A., Llandilo, architect :—

Davies, L.	£1,207	0	0
Davies, J.	1,155	0	0
Jones, D.	1,080	0	0
Evans, P.	930	0	0
Davies and Jones	840	0	0
Evans, D.	825	0	0
Jones, D. H., Llandilo (accepted)	800	0	0

Ledbury.—For alterations to the board schools. Mr. Godsall, architect :—

Smith, of Ledbury (accepted).

London.—For the erection of a block of warehouses, High-street, Stratford, E., for Messrs. A. T. Morse and Co. Messrs. Newman and Jacques, 2, Fen-court, E.C., architects. Quantities by Messrs. R. L. Curtis and Son :—

Newman, J. H.	£5,546	0	0
White and Son	5,186	0	0
Catley, J.	5,150	0	0
Craig, T. H.	4,999	0	0
Sabey and Son	4,900	0	0
Howlett and Co.	4,890	0	0
Calnan and Co.	4,830	0	0
Hearle and Farrow	4,800	0	0
Bishop and Webb	4,790	0	0
Coxhead, F. J.	4,770	0	0
Maddison, W. J.	4,717	0	0
Scott, S. J.	4,675	0	0
Nightingale, B. E.	4,669	0	0
Kirk and Randall	4,649	0	0
Reed and Son	4,640	0	0
Higgs, F. and H. F.	4,632	0	0
Pattison, S. and W.	4,538	0	0
Fortescue, W.	4,498	0	0
Sharpe, G.	4,445	0	0
Gregar and Son	4,444	0	0
Batley, Sons, and Holness*	4,439	0	0

* Accepted.

Maidstone.—For the reconstruction of the sewer in Upper Fant-road, for the town council :—

Wallis and Sons (accepted)	£142	0	0

[Lowest tender received.]

Newport, Mon.—For the erection of an infectious diseases hospital, for the town council :—

Morgan, A. S., and Co., Newport	£8,800	0	0

(Accepted).

Plymouth.—For the erection of two limekilns at Deadman's Bay, Plymouth, for Messrs. Sparrow and Co. Mr. H. J. Snell, architect :—

Partridge, J.	£1,040	0	0
Lethbridge, A. R., and Son	815	0	0
Jinkin, W. T.	800	0	0
Blowey, P.	686	0	0
Finch, J. (accepted)	480	0	0

(All of Plymouth.)

Sandy.—For new store rooms at Sandy. Mr. E. Twelvetrees, Sandy, architect :—

French and Co., Sandy	£135	0	0
Cope and Hendry, Sandy	112	10	0
Hendry, R. A., Sandy (accepted)	108	10	0

Sandy.—For the erection of two villa residences. Mr. E. Twelvetrees, Sandy, architect :—

Hendry, R. A., Sandy	£607	10	0
French and Co., Sandy	576	0	0
Cope and Hendry, Sandy	576	0	0
Coleman. Bedford	575	0	0
Fathers, Bedford	523	0	0
Rainsford Bros., Potton (accepted)	517	0	0

[Including a separate tender for plumbing, glazing, and painting.]

Saxmundham.—For the erection of a board school :—

Knowles, G. P., Aldeburgh	£2,052	0	0
Cutting and Sons, Saxmundham	1,894	0	0
Leggett, R., Middleton	1,804	0	0
Gibbs, W. H., Saxmundham	1,800	0	0
Barrell, G., Woodbridge	1,732	0	0
Smith, W. J., Woodbridge	1,720	0	0
Carter and Son, G., Saxmundham*	1,565	0	0

* Accepted.

Southborough, Kent.—For isolation hospital buildings and water supply :—

	A.			B.		
Langley and Co., Crawley	£2,798	0	0	—		
Jarvis, J., Tunbridge Wells	2,843	15	0	—		
Strange and Sons, Tun. Wells	2,776	18	0	£169	0	0
Langridge, R., Snodland	2,775	7	7	116	16	0
Avard, R., Maidstone	2,727	0	0	—		
Davis and Leney, Goudhurst	2,692	0	6	201	11	0
Punnett, E., Tonbridge*	2,688	0	0	—		
Porter, D. H., Queen Victoria-street, E.C.	2,359	0	0	97	0	0
Seal and Austen, Tonbridge*	—			111	6	6

A.—Buildings. B.—Water supply.

* Accepted.

Spitalfields.—For new building on site of Nos. 20 and 22, Hanbury-street, Spitalfields, E., and buildings in rear. Mr. Alfred Conder, F.R.I.B.A., Palace Chambers, Westminster, architect. Quantities by Mr. Edward J. Paine, F.S.I., of 11, Great James-street, W.C. :—

Chapman, J.	£2,679	0	0
Chessum, J., and Sons	2,547	0	0
Knight, T.	2,529	0	0
McCormick and Sons	2,482	0	0
Holloway, H. L.	2,339	0	0
Stimpson and Co.	2,334	0	0
Greenwood, J.	2,263	0	0
Brady, G. F. (accepted)	2,200	0	0

York.—For strengthening Lendal Bridge, for the city council :—

Cleveland Bridge & Engineering Co.	£702	0	0

(Accepted.)

FRIDAY, OCTOBER 12, 1894.

THE COMING RACE.

As another autumn begins, bringing with it fresh opportunities of training for the young architect, and of study for the older one, it is natural to ask what all these opportunities are doing for us. To some extent we can see what they are doing for those who are in practice. Their works speak for them, or against them, in a language which all can understand. Of those who have not got so far, it is less easy to judge. Time tries all, and of these some may turn out better and some worse than there now seems reason to expect. Under the present aspect, however, they are marked off with unusual clearness into two classes—the promising and the unpromising. Never before, perhaps, was there so much to be hoped for from the one set, and so little from the other.

The best men in the coming race have had advantages which their predecessors never enjoyed, and they have profited by them as it was right they should do. The pupil who was articled 30 years or more than 30 years ago was generally started on the wrong track to begin with. If he was in a so-called "Classic" office, he was simply taught how to affix the "Five Orders" as an external application or dressing to all sorts and conditions of buildings. If he was in a "Gothic" office he too often learned no more than to apply ecclesiastical details of the 13th or 14th century to churches, houses, shops, and offices alike. It was the theory of the time that whatever was good for one of these was good for all. Even then, archæologists saw that this was not quite the practice of the Middle Ages. The doors and windows in a 13th-century house were not exactly like the doors and windows in a 13th-century cathedral, and when the 14th or the 15th century was in question. the difference was still greater. But this little difficulty never staggered the Mediævalist of the bygone generation. If the ancient builders did not insert ecclesiastical details everywhere, he thought it was only because the ancient builders did not live up to their own principles. For his part, he scorned such inconsistency. Purity was his war-cry, and he meant to be purer than English art at its purist. Gothic, he said, was an arched style, therefore a straight window-head was a sin. It did not dawn on him that architecture had its poetry and its prose—its separate ways of dealing with lofty things and low ones. He only saw that the poetry was the higher of the two, and could not understand why, this being so, there was any need for the lower. So he went on with his arches and his shafts, his canopies and his tracery, making the vulgar laugh and the judicious weep. Look through the volumes of any architectural journal from 1850 to 1870 or later, and you will find his works, and will see what it is to abjure the right of private judgment, and "go it blind," as the Americans say, on the advice of some eloquent oracle.

The young architect of to-day has been saved from all this. Not by words, but by works, which spoke louder than words, a few able men, of whom Mr. Norman Shaw was perhaps the most influential, long since turned the efforts of the Gothic school into a more sensible direction. He, and others who proceeded nearly on the same lines, showed the wonderful beauty and picturesqueness which might be brought out of architectural forms, which the art-dogmatist had condemned as indefensible. They took up 15th, 16th, and 17th century domestic details, the very things which the pure and correct men of the Scott and Parker period made a point of shuddering at as "debased," and made out of them compositions so admirable that all the world fell in love with them. They showed that form, like colour, is mainly relative; that everything depends on selection and arrangement. We might almost say they rediscovered art—no doubt, it must be said, with reservation. By a few men art had never been quite forsaken; but the crowd, both in the profession and out of it, knew of nothing, cared for nothing, worshipped nothing but style. If a building was in the right style, and had the correct details of the style, everybody was satisfied. There was often indeed one exception—namely, the person for whom the building was erected, and who found himself saddled with many things which he did not want, and deprived of many which he did, because the style required these, and forbade the others. But nobody minded him: style-worship went on gloriously, and might be going on still if the vision of art had not drawn its worshippers away.

Style-worship is over now: the coming race has escaped from this superstition. Not by any means has it got rid of the need for studying style; but it has been taught to study it as a means towards producing art—not as an end in itself. At last a generation is springing up with the advantages of liberty as well as of training; and its most promising members are working with a spirit and freshness which those find it hard to attain whose youth was wasted in the slavery of mechanical repetition, and whose ideas were shaped to suit a set of exploded beliefs. With older men, style was a master; with some of the rising group, it promises to be a servant, and an obedient one. Nor are they bound to one style, as their predecessors generally were. Whatever they have an affinity for they can adopt. It is the age of experiments, and happy are those who begin life now with opportunity, ability, and adequate instruction.

So much for the coming architect of the best type. Three generations, to adopt Carlyle's simile, have fallen to fill up the ditch, and he walks into the fortress over their bodies. It is only fair to remind him that he would hardly have got there without them. A Pugin had to write his "Contrasts," and a Scott to build his churches, and a Shaw to show us all what Domestic work could be, that this heir of the ages might learn with ease all they learned with infinite labour. Let him learn it, and add to it all he can for his successors to learn. But there is a class—and a large one—which does not care to learn. Delivered from one danger—that of mistaking style for art—it is running into the opposite one: that of neglecting style altogether. It makes no serious study of ancient work; in fact, it does not so much as know the most suggestive of ancient works by name. It takes a casual glance at the designs of some clever contemporary, and does what it can, in a careless way. to repeat their details. Its productions might be labelled "Attempt at Imitating Mr. Collcutt," "Attempt at Imitating Mr. Ernest George," "Attempt at Imitating Mr. Sedding," and so on. We may call this class the tribe of the brain-suckers.

The characteristic of the brain-sucker is that, instead of filling his own head with thought and information by learning all he can of what art has done already, he fastens on some one man who has gone through this labour, and tries to appropriate the ideas that have resulted from it. Fortunately, ideas cannot be successfully carried off in this way. The parasitical architect is soon detected—at least, in his own profession. His imitations are too feeble. and, above all, he has not the art—the supreme art—of composition. Even if he could copy the details of his model line for line, he is hopelessly lost when it comes to putting them together. Now, it is in the putting of things together that art mainly consists. When they are thrown into a heap by chance or clumsiness, every one spoils the others. It takes the highest skill so to join them that each gives beauty to the rest, and that all unite into one organic whole. Everybody who has a dictionary has at command the words which make up the finest lines in Shakespeare, and Keats, and Tennyson. Which of us can make out of them, or out of the thousands of others at our service, a line like those in the moonlight scene in the "Merchant of Venice," or half a verse like those in the "Ode to a Nightingale"? Everybody who has a piano can strike the notes which enabled Handel and Beethoven to do all they did; but who can combine them afresh into music like theirs? Now the architectural brain-sucker, when he has plagiarised his details, has only got hold of a set of words like those in a dictionary—a set of notes like those in a musical scale. He is not within measurable distance of producing what deserves the name of a design.

To make any advance, it is necessary to know what has been done before. Half the difficulties we meet are not new difficulties. They were met and conquered ages upon ages before we saw the light. And half the possibilities before us are not new ones either. Generations ago, other workers, it may be, in many a country besides this, have had the same chances, and have used them—some to better purpose, and some to worse. The obtuse man thinks their ideas can have nothing to teach us, because, forsooth, they were expressed in a different style. They have everything to teach us. We must look through the thin disguises of style, and grasp the underlying thought. It is this we want to get at; and this, once seized, we may work it out in our own way, and clothe it with our own details. What are some of the cleverest designs of the day but Mediæval thoughts skilfully translated into Renaissance language? The art of composition may be learned from works in every style. The same geometrical forms underlie them all. The laws of proportion apply to them all. They can all teach those who have eyes to see and minds to understand, how this type of form injures that, and improves the other. It is such lessons as these that a tentative and experimental period most needs. They are only to be learned by a thorough and systematic study of the best examples.

If there is one member of the coming race more unpromising than the brain-sucker, it is certainly the examination-passer. He is the man who can pass examinations, and can do nothing else. To him they are not, as they ought to be to every student, a motive for acquiring indispensable knowledge; on the contrary, they are a sufficient end in themselves. The examination-passer crams for the occasion, scores a success, and straightway forgets all he learned to secure it. Ask him, a year or two afterwards, for a bit of the knowledge he was supposed to have made his own for life, and it has quite escaped his memory. Ask him to make such a calculation as he had to make before, and he has no notion even of the elementary principles on which it proceeds. He has given up study—his education is finished; the examiners, he says, consider him qualified to be an architect, and that is enough for him. So it happens that, between the best and the worst of the coming race, there is a gulf so wide and deep, that our profession hardly ever saw its like before.

THE ART OF SPECIFYING.

Two ways of writing specifications are known to architects and builders—one the perfunctory and ambiguous, and the other the explanative. The former of these modes is most common among those who have to make a compromise between the owner and contractor, who have to disguise the real requirements while pretending to make the specification a complete list of requirements. It is the old story repeated of holding with the hare while running with the hounds. As a matter of fact, the perfunctory specification is a loosely-drawn-up document, on this account easy, not written till after the drawings are prepared—often not till the quantities are being taken off, as then it is easier to make the provisions agree with the surveyor's. Often it is little more than a copy of the preambles of the bill, a bare recital of provisions of the "provide and fix" order. The quantity surveyor generally prefers this method, as it does not handicap him at every turn; it allows him full play in putting down just what he thinks necessary to make his bill tally, and there can be no disagreement between the documents. By the help of the drawings he can take off his items much quicker when he has no specification to hinder him, provided, of course, he is an expert at his business, and is not forgetful of requirements. Yet to a man with imperfect memory, or who has not a free hand, it will be allowed that a specification is a great aid, as he can simply transfer a great many of the items to the bill. The latter plan has, however, the risk of adding to the responsibility of the architect if the document is deficient in any important particulars. There is only one way of writing a perfect specification, and that is to begin to write it when the contract drawings are being prepared, and to make a list of provisions and items as the drawings and details proceed, making one explain the other. This simultaneous method has the great advantage of making the tangible and palpable expression of the building assist the memory, and of precluding any serious omission. Every section and elevation suggest questions of construction of technical requirements; the drawings of floors and roofs bring to the mind the scantlings and the actual details which have to be specified. While the drawings and details are being thought out, the mind perceives the requirements, and apprehends them more perfectly than when they are finished. What the drawing only shows partially or on one side, the real thought of the designer may put down in words, thus making the specification explain those parts or operations which cannot be represented by lines. Many architects very usefully adopt the plan of supplementing their working drawings with notes in the margin or in the drawing itself. All these thoughts and suggestions, which occur while the architect is thinking over the problem, disappear or are lost sight of when the drawings are finished. The specification writer can then only guess at what he sees, and loses sight of the actual requirements which occurred to the designer or draughtsman.

The instructive paper on "Specification Writing," read before the Architectural Department of the University of Pennsylvania by Mr. T. Roney Williamson, architect, and reprinted in our present and last two issues, suggests a few considerations to the young architect who is anxious to write a specification that can be put into the hands of any builder or tradesman. We are sorry to say many of the specifications placed in the hands of practical men rather provoke disrespect or excite laughter, as when, for instance, a certain kind of timber is specified that cannot be obtained, or something is described which is impracticable or ridiculous on the face of it, and which a practical architect would never have thought of describing in such a way. Can we expect an engineer or plumber to do his best when a specification describes a method of doing a thing which would result in failure if it was, or if it could be, done in the manner described? In dealing with masons' work or bricklayers', carpenters', or sanitary work, great care is required not to specify anything about which one has not actual knowledge. To specify a particular timber that is not obtainable in the market, or a mode of setting ironwork, like an oven or a boiler, that is wrong in principle, is to inflict a wrong on the client, and to obviously impugn the architect's credit for competence. Sometimes the textbook is at fault which may be consulted about some detail, as the strength of cement. Mistakes, as Mr. Williamson says, are two-edged swords, as they "destroy your client's confidence as well as your own." Exact knowledge is absolutely essential, and we can only acquire this by long and careful study, and by a knowledge of buildings and workshop details. No book reading will give the young architect the requisite knowledge without having the mind, the eye, and the hand brought into actual touch with real materials and the methods of workmanship. Even the technical school, unless it is applied, is misleading, for it confines the attention to particular demonstrations in the classroom or workshop.

We see a number of specifiations that are ambiguous, and loosely worded. The clauses are too general in their phraseology—a fault that is most common in the perfunctory specification prepared to obtain low tendering. They may mean a good deal, or they may mean nothing at all. The vague specification is the speculating builder's opportunity. He will find room to twist and wriggle about, to evade the true intent and meaning, and put in a tender which is ridiculously below the real cost. More cautious contractors will make it the opportunity of increasing their tenders by a large percentage, to cover all contingencies that they do not clearly foresee. To general clauses we owe all our wide tendering. The advice given is to make your paths straight and narrow, so that there shall not be any doubt about the meaning, and no room to wobble. We admit also that it is helpful to use trade terms—the builders understand them better than general terms. And the same as to goods. Mr. Williamson says it is better to specify two or three makes "equally good" than one of a particular manufacture. No doubt, if the condition "equally good" is complied with; but sometimes it is impossible to name more than one make. To name as optional one of two or three makers would often lead to undesirable competition among the tradesmen specified. It is no less necessary to be precise about matters which cannot be shown in the drawings—such as scantlings and sizes of beams and girders, the kind of glass to be used, the fittings and ironmongery, wall-papers and finishings. Exact and minute descriptions are absolutely essential to accurate and careful estimating. We cannot conceive a fair tender without definite and clear particulars. In fact, it is a common thing for a contractor to add 15 or 20 per cent. to items which are uncertain or ambiguous. When a thing is definitely expressed, there is no room for guessing.

When it becomes impossible to describe clearly any particular fitting or decoration—say, for example, a tile pavement, or chimney-piece or grate, or a wall-paper or leaded glass—and where a drawing may be impossible or misleading, a fixed price or a lump sum is generally provided. The provisional sum has the advantage of fixing the amount to be included in the tender, allowing each owner to select his own goods. Such things as electric-light fittings, gas-fittings, stoves, closet apparatus, ranges, and a variety of other things can only be properly dealt with in this manner, as, if they were left open to the contractor, a considerable margin would be left for underbidding. As to the arrangement of the trades, specifications differ much in form; the most rational order is that which is really followed in the building. As Mr. Williamson says, each trade should be complete in itself, so that the work may be let out separately if necessary. Yet this is sometimes impossible, as when a particular trade—say, the engineer—has to be attended to by the bricklayer and carpenter. In every building there are certain things to be done to render each trade complete: thus the bricklayer has to wait upon the carpenter, the plasterer on the joiner, and so on. Work and materials are to be supplied in connection with some particular trade, and these have to be specified. The interference of one trade with that of another is a frequent source of trouble and imperfect finish, yet no doubt it is a good plan in some cases to get the plumber or the engineer to do the necessary woodwork, painting, papering, necessary to complete his own work, and to make him responsible for it.

An accurate and comprehensive knowledge of materials, building appliances and fittings, and improved methods is absolutely essential to the specification writer, and we can easily imagine what serious mistakes a man ignorant of these things might make in accepting fittings that were not up to approved standards, or are out of date. It is well for the architect to be tolerably well read in the literature of manufacturers' catalogues and advertisements, as these trade announcements "post him up" in a number of new things, like fireproof floors, sanitary traps, and new decorative materials, that are not to be learned by any other means. Representative technical museums and exhibitions of building appliances are useful, too, when they can be depended on, though of late these means have been untrustworthy, or conducted on very narrow commercial lines. The division of a specification into trades is not likely to fall into disrepute, notwithstanding many leading quantity surveyors suggest the "group" system of "taking off," instead of the former. To a certain extent, indeed, it is carried out in some of the trades specified, as in the bricklayer, carpenter, and joiner. In describing the framing of a roof mention is made of iron bolts and straps, in doors of butts and ironmongery; but to bring together all the trades required in making a roof or a floor would be to complicate and render the document useless for the distinct trades. The "group" system, as proposed by Mr. Searle in his new work, is certainly a more rational and scientific mode of classification than the present plan for quantity taking on the basis of trades, as it simplifies the process, and, above all, allows a quick analysis to be made of a bill in case of alteration or omission. As the memory is assisted by the grouping of particulars and items according to purpose, there is much less chance of omitting any important items. There may be a little more trouble in extracting the distinct trades for specification purposes.

All suggestions which help towards the framing of a perfect specification are useful. We do not place much reliance on stereotyped forms of clauses such as our American cousins have published, nor to works which pretend to give models of specifications, however useful in their way. The real secret of specification writing is to know clearly what is wanted, and how it should be done. No conventional phraseology need trouble the student if he only masters a method of treating each trade, and is perspicuous in expressing himself. Each trade he should know thoroughly—the materials and technical processes used, and the methods of workmanship. He should make his drawings and specifications agree, one explaining where the other is silent, and for this purpose the system we have referred to is the one which has been found to give the best results.

Mr. Shaw Lefevre visited Grimsby on Tuesday for the purpose of opening the new workhouse, which has just been completed at a cost of £30,000.

THE LONDON BUILDING ACT.—III.

We must pass more rapidly over the remaining portions of the new Act, and we next take up Part VII. relating to "special and temporary buildings and wooden structures." Section 82 re-enacts sec. 56 cap 122 of 18 and 19 Vict. of the present Act, though in somewhat different terms, as to the erection of an iron building or structure, to which the general provisions of the last part are inapplicable. The builder is required to make an application to the Council accompanied by a plan of the building and such particulars as may be required. If satisfied, the Council may signify their approval of the same in writing, but they shall not authorise any building of the warehouse class to be erected of greater cubical extent than 250,000c.ft. (not 216,000c.ft. as heretofore), except in accordance with the foregoing provisions. A copy of the plans, &c., are to be furnished to the district surveyor, whose duty is to see that the building is erected in accordance therewith. Clause 83 provides control by the Council of certain temporary buildings on similar terms as the present Act (45 Vic. sec. 12)—that is to say, the Council may, if they approve the plans and particulars, limit the period during which the temporary building is to remain, and may make their approval subject to such conditions as to removal, or otherwise, they think fit. The Council may serve notice requiring removal, and if not complied with, they may incur any penalty, and cause the building to be removed after complaint before a Petty Sessional Court. Section 84 prohibits the setting-up of any wooden structure (unless exempt from this part of the Act), except hoardings inclosing vacant land, and not exceeding in any part 12ft. in height, without a license from the Council, which may contain certain conditions as the Council may think expedient. Such license is not to be required in the case of any wooden structure of a movable character erected for a builder's use during the construction, alteration, or repair of any building, unless it be not taken down after such construction; but this section does not apply within the City. The above section is only a slight verbal revision of that now in force (section 13, 45 Vic.)

The rights of building and adjoining owners, Part VIII., have been improved and rearranged. Section 87 is not found in the existing Part III. of the present Rules. It provides that where lands of different owners adjoin and are unbuilt on at the line of junction, and either owner desires to build, the following provisions shall have effect:—(1) If the building owner desires to build a party-wall he may serve notice on the adjoining owner describing the intended wall; (2) if the latter consent the wall shall be built half on the land of each owner, or in such other agreed position; (3) the expense of the wall is to be defrayed from time to time by the two owners in due proportion, regard being had to the use made of the wall; (4) if the adjoining owner does not consent, the building owner shall only build the wall as an external wall on his own land; (5) the building owner may build an external wall on his own land by giving notice to the adjoining owner, describing wall; and (6) where the building owner builds an external wall, he shall have the right, at his own expense, at any time after a month to place on the land of the adjoining owner below level of the lowest floor the projecting footings of the external wall with concrete or other solid substructure, and make compensation to the adjoining owner for any damage occasioned thereby, the compensation, if any difference arise between owners, being determined in the manner directed.

The rights of building owners (section 88) are practically the same as those now in force (section 83), a few literal revisions only being made of a trivial kind, as the insertion of the word "underpin" in the clause "A right to make good, underpin, or repair any party structure which is defective or out of repair." One additional sub-clause (12) is introduced which gives a building owner right to raise a party fence wall, or to pull the same down and rebuild it as a party-wall. The next section, 89, as to the rights of adjoining owners, is also, with a few literal alterations, the same as that of the present Act. One of these is that "the adjoining owner may *by notice* require the building owner" to do certain works, &c. These include "copings" as well as jambs or breasts or flues, &c. Any difference between the owners to be determined in the manner directed. The rules as to exercise of rights by building and adjoining owners (section 90) have been recast. Sub-clause (1) reads "A building owner shall not, except with the consent in writing of the adjoining owner *and of the adjoining occupiers*, or in cases where any wall or party structure is dangerous (in which cases provisions of Part IX. shall apply), exercise any of his rights under this Act in respect of any party *fence wall*, unless, at least, one month, or exercise any of his rights under this Act in relation to any party-wall or party structure other than a party-fence wall unless, at least two months before doing so, he has served on the adjoining owner a party-wall or party-structure notice, stating the nature and particulars of the proposed work, and the time at which the work is proposed to be commenced." This amended clause is more definite and liberal in its terms than the old one. The *italicised* words are new and important, as, for instance, adjoining occupiers are to have a word in the rebuilding of any party-wall. The original clause requires three months' notice to be given to the adjoining owner; the new one says one month's notice for party-fence walls, and two months for a party-wall. The other sub-clauses require the building owner at his own expense to make and maintain a proper hoarding and shoring for protection of adjoining land and building; not to cause unnecessary inconvenience to the adjoining owner or occupier. The work to which the notice refers must begin within six months after service, and it will be seen, on comparing these clauses with the old ones, that requirements in respect to notices have been simplified. In the new Act the settlement of differences constitutes a new section, and these have been revised, and re-embody those of 45 Vic. sect. 21. Section 91 practically recites the same mode of settling differences as exists now by the appointment by each party of a surveyor (unless they both concur in appointing one), and the two thus appointed selecting a third surveyor; and such one surveyor, or three surveyors, or any two of them, shall settle any matter from time to time during the continuance of the work. Any award given to be conclusive, except that either of the parties may appeal to the County Court within fourteen days from the delivery of the award. Sub-clause (5) allows the appellant, if the sum he is liable to pay exceeds £50, to bring an action in the High Court, if he can prove to the County Court judge his liability. The subsequent clauses (8 to 12) relate to the refusal, neglect, or death of the surveyor or surveyors appointed, and to appointment of others having the same powers and authorities, &c. If either of the two surveyors appointed by the parties refuse, or for seven days neglect to act, the other surveyor may proceed *ex parte*, and his decision shall be effectual. Section 92 is modified: it re-enacts the power for building owner to enter premises to execute any work which he was entitled to in pursuance of this Act, and his servants, agents, and workmen, at all usual times of working, may enter and remain on any premises; but before entering the building he is to give fourteen days' notice of his intention, except in an emergency.

Section 93 provides that when a building owner intends to erect within 10ft. of an adjoining building, any part of which extends to a lower level than such building, he may, and if required shall, underpin or otherwise strengthen the foundations; two months' notice to be given of his intention, accompanied by plans and sections, and if the adjoining owner within 14 days disputes the necessity, a difference shall be deemed to have arisen. The building owner is liable to compensate the adjoining owner for any inconvenience, loss, or damage. This new provision will prevent many accidents to adjoining structures, and guarantee the adjoining owner against settlements, which often occur. The next section requires the building owner to give security, also the building owner may serve a counter requisition requiring the adjoining owner to give security for payment of expenses for which he is or will be liable, &c. The rules as to expenses in respect of party-structures (95) are only slightly different to those of the present section 88, and these rules generally provide that if any party-structure be defective or out of repair, or be pulled down and rebuilt, or if any timber partition dividing a building be pulled down, and a party-structure be built instead, or any rooms or stories be pulled down and rebuilt, in conformity with this Act, the expense of such work shall be borne by the building and adjoining owners in due proportion, regard being had in each case to the use that each owner makes, or may make, of the structure, &c. As to expenses borne by the building owner, the existing sub-clauses are unaltered, with two additional ones; one to the effect that if any party fence wall be raised the expense thereof is to be borne by the building owner; also, if any such wall be pulled down and built as a party-wall, the expense thereof shall be borne by him. The adjoining owner is to pay a due proportion of the expenses of any party structure or wall made use of by him beyond the use made by him before the alteration—i.e., the expenses of raising or underpinning such party structures; and making good and carrying up all flues and chimney-stacks belonging to adjoining owner, and of pulling down and rebuilding party-fence wall. The following four sections relating to "account of expenses of works delivered to adjoining owner" (96), "appeal against account" (97), "building owner may recover if no appeal made" (98), "structure to belong to building owner until contribution paid" (99), are unaltered. Section 100 makes the adjoining owner liable for all expenses incurred on his requisition, and payment may be recovered as a debt; and 101 enacts: Nothing in this Act is to authorise any interference with an easement of light or other easements in or relating to a party-wall, &c. This last clause is a necessary addition to the old Act.

"Dangerous and Neglected Structures" form Part IX. of the new Act, and comprise the enactments of the 18 and 19 Vic. cap. 122, 45 Vic. cap. 14, and other sections. These sections have been remodelled and made more concise. The present section 69 appears in a less involved form. The meaning of "structure" is first defined (102), and "includes any building, wall, or other structure, and anything affixed to or projecting from any building, wall, or other structure." As now, section 103 stipulates that the Council shall require a survey of any structure in a dangerous state to be made by the district surveyor or other competent surveyor, and he is to make known to the Council any information he may receive, and to make a survey of such structure. Within the City, the Commissioners of Sewers are to take the place of the Council (section 104). The surveyor is to give certificate to the Council of his opinion (105), and if it is to the effect that the structure is in a dangerous state, the Council is to cause the same to be shored up or otherwise secured, and a proper hoard or fence to be put up for the protection of passengers, and notice to be served on owner or occupier, &c., as in the present Act (section 106). If the owner fail to comply, a Petty Sessional Court, on complaint by the Council, may order the owner to take down, repair, &c., the structure within a certain time, and if the same be not done within the time stated, the Council may cause the work to be done in the manner set forth in the Act (section 107). If the owner dispute the necessity of the requisitions in notice, he may, within seven days after service of notice to himself, require the subject to be referred to arbitration, and appoint an independent surveyor to report on the condition of structure in conjunction with district surveyor, and all matters in dispute not agreed to between them be referred to a third surveyor previously appointed. The award to be made within 14 days. The expense to be paid by the Council if the award is adverse to the district surveyor, or by the owner if adverse to him. By 108 the Petty Sessional Court, on complaint of Council, may make an order, notwithstanding notice as to arbitration, to take down, &c. All expense incurred by the Council on obtaining any order, is to be paid by the owner, but without prejudice to his right to recover the same from any other person (109). The other clauses respecting missing owner, selling structure to pay expenses (109), and provisions respecting sale of dangerous structures (110), proceeds if insufficient, recovery of expenses, re-enact the present provisions—sections 74, 18 and 19 Vic. and Amendment, but are simpler and consolidated. Section 114 recites section 80 of the old Act respecting removal of inmates from dangerous structures, and section 115 re-enacts the removal of dilapidated and neglected structures as exists under 45 Vic. sec. 17, though in fewer words and with less circumlocution. The provision for enforcing repayment of expenses incurred by Council (116) also repeats the existing section, and directs that no part of the land occupied by dangerous or neglected structure shall be built upon, or, if it is rebuilt or repaired, shall be let for occupation until after payment to the Council.

Part X., on "Dangerous and Noxious Businesses," the 7 and 8 Vic. section 54, of present Act is re-enacted, which makes it unlawful to erect any building nearer than 50ft. from any building used for any dangerous business, provided that where a building erected before the 9th of August, 1844, within 50ft. from any building for the time being used for any such dangerous building is pulled down, burnt, or destroyed by tempest, such building may be rebuilt. Section 54 of the present Act remains in force, which makes it unlawful for any person to carry on a dangerous business in any building, vault, or in the open air, at a less distance than 40ft. from any public way, or than 50ft. from any other building or vacant ground belonging to any person other than his landlord. Then follow the businesses deemed to be dangerous, which list has been slightly altered. The next section provides, no dwelling-house is to be erected or rebuilt nearer than 50ft. to a building used for any noxious business, except in the case of a house built before 9th of August, 1844. The other clauses follow the present Act, and prescribe the same distances from public ways and dwellings of 40ft. and 50ft. respectively for businesses in buildings, vaults, and open air. Section 120 provides for noxious businesses existing before 9th August, 1844 (see sections 54 and 58 of that Act, and the legal proceedings in such cases). Public gasworks and distilleries are exempt from these provisions.

Part XI. section 122 retains the very desirable legislation relating to "Dwelling-houses on Low-lying Land," which are now dealt with under 56 and 57 Vic. section 5, and which prohibits the erection of any building, used wholly or in part as a dwelling, upon land of which the surface is below the level of Trinity high-water mark, or which cannot be drained by gravitation into any sewer, except with the permission of Council. They may also (clause ii.) regulate the erection of dwelling-houses on such land or any defined area; and (iii.) prescribe the level at which the under side of the lowest floor of any permitted building shall be placed on such land. Persons are to make application to the Council for a license to erect on any such land, and the question is to be referred to the chief engineer of Council, who shall decide the conditions upon which the erection or adaptation may be permitted; if dissatisfied, the person may appeal to the Tribunal. The Council may make regulations, &c. (sections 123, 124.)

Part XII. section 125 treats of "Sky-Signs." It re-enacts the provisions of the London Sky-Signs Act, 1891. The term "sky-sign" is defined in that Act as any "letter, model, sign, or device, or representation in the nature of an advertisement, &c., supported on or attached to any post, pole, standard, framework, or other support wholly or in part upon, over, or above, any building, &c., which, or any part of which, shall be visible against the sky, &c." The expression also includes any balloon, parachute, or similar device, &c., but is not to include (i.) any flagstaff, pole, vane, or weathercock, unless adapted for advertising; (ii.) nor any sign, board, frame, or other contrivance fixed to, or on the top of, a wall, parapet, cornice, blocking-course, or ridge of roof, provided it be of one continuous face and not open work, and is not more than 3ft. above the same. We may ask, Why is not such a board equally as dangerous and unsightly, and for what reason is it excluded? Clause (iii.) excludes also any sky-sign which belongs to a railway company, and which is placed so that it could not fall into any street. District surveyor of each district is to inspect and survey sky-signs (section 126). Section 127 enacts that from the commencement of this Act it shall be unlawful to erect any sky-sign as defined. Section 128 regulates existing sky-signs, except those erected in accordance with the terms of a license granted before this Act under the Sky-Signs Act, 1891. The next section provides for a renewal of such license for a further period of two years, and for further renewals not exceeding six years. Forms of certificate of surveyors, respecting sky-signs, refusal of certificate and forfeiture of license in certain cases, removal of signs, &c., are contained in subsequent sections 130—135.

Part XIII. section 136 relates to the appointment of superintendent architect and district surveyors, examination of candidates for that office, powers of Council to alter limits of district; also as to exclusion of surveyor from acting in case of works under his own superintendence, notices to be given to surveyor by builder in certain cases (145), power of entry to inspect buildings, notices of irregularity (152), payment to surveyors (154), monthly returns by district surveyors (160).

Part XIV. sect. 164 treats of the power of Council to make by-laws as the level, width, surface, and inclination of new streets, foundations and sites of buildings; foundations, materials, thickness of walls; dimensions of bressummers, of joists, protection of ironwork, external woodwork, materials for plastering, regulation of lamps, &c. Part XV., on "Legal Proceedings" (166), enacts that all offences, penalties, costs, and expenses under the Act are to be recovered under the Summary Jurisdiction Acts. County courts having jurisdiction may settle the time and manner of doing any work, and any person may appeal from any decision. Other sections refer to application of penalties, power of Council to demolish buildings and sell materials and recover expenses, procedure of local authorities in case of buildings in advance of general line, &c. The Tribunal of Appeal (sect. 175) is an important creation of the new Act. One member is to be appointed by Secretary of State, one member by the Council of the Royal Institute of British Architects, one member by the Council of the Surveyors' Institution; but no member or official of the London County Council shall be eligible. Members of the Tribunal shall be appointed for a term of five years, and any such member shall be eligible for reappointment. The Lord Chancellor can, if he think fit, remove for inability or misbehaviour, or other reasons, any member. When any vacancy or illness occurs of any member, the Secretary of State, or the particular society, whichever appointed the member, shall appoint a fit person to take his place. Each member of the Tribunal of Appeal is to be entitled to remuneration by annual salary or by fee, as may be fixed by Secretary of State. Other sections provide for the appointment of officers, the powers of the Tribunal to state case for opinion of High Court, procedure of Tribunal to hear and determine appeals, and to have power to hear counsel, solicitors, or agents, as well as the interested parties; to administer oaths, to hear evidence, &c. Sect. 185 enacts, any order of the Tribunal of Appeal may be enforced by the High Court, as if it had been an order of that Court. All fees, &c., paid to the Tribunal shall be paid over to the Council and carried to the County Fund. The last part of Act deals with miscellaneous matters, such as expenses, power to annex conditions to consent, &c.; proceedings where no notice is given; plans, &c., to be property of Council; offences against Act; buildings and works exempt from the operations of the Act. These include greenhouses not attached to other buildings, also those attached so far as regards the necessary woodwork of sashes, doors, and frames—a provision that will be welcomed. Certain rules as to conversion of buildings (211) will also safeguard the public against undesirable and unsanitary arrangements. To some of these, and other special sections of the new Act, we may return. We now complete our summary of the leading provisions of the Act, and reserve any critical remarks to another occasion.

DESIGNING OF STEEL BRIDGES, THEORETICAL AND PRACTICAL.—IX.

TO be able to calculate the stresses upon a girder, a bridge, a roof, or any other example of architectural or engineering constructive work, arising from a concentrated or uniformly-distributed loading, will not in itself make a man a good designer of steelwork. He must have some knowledge of the fitter's craft, and be thoroughly conversant with the methods usually adopted in the workshops for framing or putting together the component parts, and the various members of large and heavy trusses, gantries, cranes, and other forms of steel and ironwork generally. It is for this reason that we have given the double title to our series of articles, insomuch as a practical knowledge is as essential, or even more so, than a theoretical. Having already determined the stresses due to the maximum loads which can possibly affect either the principal or the cross girders, and assigned to them their proper respective net sectional areas, we have now to consider the best means of putting them together, so as to form one substantial and complete structure. In the first place, before the rest of the platform and roadway can be arranged, it is necessary to connect the cross girders with the principals. For this purpose bolts are sometimes employed; but it is preferable, especially in

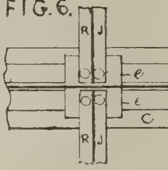

FIG. 7.

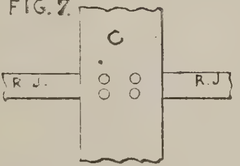

bridges of the solid web or plate type, to use rivets. When very large bridges are in evidence, and with open webs, with great panel-length, it sometimes becomes an open question for discussion whether both bolts and rivets cannot be discarded, and another method adopted for forming the required connection. It must be kept in view that great panel-length, in an open-web bridge girder, signifies a correspondingly large interval between each successive bay, which again necessitates a lesser number of cross girders, and, consequently, an increased sectional area and weight for each individually. This increased weight is unavoidable, since, as a general rule, liable to very few exceptions, each separate cross girder is attached to the principals at the junction of the diagonal bars of the web with the booms, that is, at the apices of each panel-length. As an instance may be mentioned the Rue de Tolbiac bridge, recently constructed in Paris. It was a bowstring of great panel-length, and the heavy cross girders were slung or suspended from the lower chord or boom by especially designed steel stirrups. As far as we are aware, this is the only example of this particular description of attachment.

A general detail cross section, drawn to scale, of the bridge under design is given in Fig. 1, and the mode of connection of the main girder M and the cross girder C requires attention. It will be seen that the connection is discontinuous, owing to the fact that in order to secure as much bearing as possible of the cross girder on the main girder, which, at the most, is barely 9in.; the ends of it, Figs. 1, 2, and 3, abut close up to the longitudinal angle irons of the main girders. A couple of angle irons, A, 3in. by $2\frac{1}{2}$in. by $\frac{3}{8}$in., join the cross girders to the main. They are riveted to the upper flange of the cross girders, to the web of the main girders, and then cranked so as to be riveted to the upper flange of the main girders, as in Fig. 1.

The two angle irons, *a*, at A A, Fig. 1, shown in Fig. 2, *a a*, which is a horizontal section along the line A A, do not touch each other, as the small return piece of the part bent down on the upper flange of the cross girders is riveted to it by the ordinary flange rivets. Where the rivets occur, small distance pieces or washers are inserted to maintain the angle irons at their proper distance apart. These angle irons, *a*, are shown cranked at their upper end in Fig. 1, in order to stiffen the upper flange of the main girder at the points where the load is brought upon it. In the case where this flange is, as in Fig. 1, only 1ft. 6in. in breadth, the additional stiffening is really not needed. But since in instances where the breadth of the flange is 2ft. or upwards, it becomes necessary to stiffen the extreme edges of the flanges of the main girders at the points where the cross girders are attached, the manner in which to accomplish it has been demonstrated. When it happens that the main girders are deep, and their flanges consequently wider, angle irons or tee irons are riveted also the whole depth of the rib and cranked to both the upper and lower flanges exactly as in Fig. 1. Instead of the double angle irons, *a a*, one single tee iron might have been employed, but in order that the table part might take the two flange rivets of the cross girder, it must have been 7in. broad and correspondingly thick, which would have rendered it exceptionally heavy and out of keeping with the rest of the steelwork. It is impossible to lay down hard and fast rules for the use of angle, tee, channel, or other sections of steel. The particular section to be employed must depend upon the especial conditions of each individual case, and something also must be left to the judgment and discretion of the designer. It is perfectly well known that both architects and engineers differ in their opinions respecting the relative merits of different sections of steel joists and other shapes, and some deference and respect are due to their experience und decision.

The cross girders are riveted directly to their bearings on the inner half of the lower flange of the main girders by rivets $\frac{3}{4}$in. in diameter, passing through both flanges. A pair of angle irons, *b b*, $3\frac{1}{2}$in. by $3\frac{1}{2}$in. by $\frac{1}{2}$in., shown at B B in Fig. 1, serve to connect the web of the cross girder throughout its whole depth to the lower part of the web of the main girder. These angle irons, *b b*, and the manner in which they are riveted to both girders, is also seen in detail in Fig. 3, which is a horizontal section through the line B B in Fig. 1. In order to keep these vertical angle irons flush, a filling piece is inserted between them and the web of the cross girders. As, however, already stated, they may be cranked over the longitudinal angle irons and the filling strip omitted. The manner in which the general riveting of the flanges and web of the cross girders is arranged is shown in the general cross section in Fig. 1, where the joints in the web occur every 4ft., and are covered by vertical strips, *d d*, 5in. by $\frac{3}{8}$in., Figs. 1 and 3. In these joints the diameter of the rivets is reduced to $\frac{5}{8}$in., instead of $\frac{3}{4}$in. Upon the upper flanges of the cross girders are riveted the rolled steel joists, 6in. by 4in. by $\frac{1}{2}$in., carrying the arched or buckled plates supporting the roadway and footpaths. The joists R J in Figs. 1 and 3 are sometimes bolted to the cross girders; but riveting them makes a better job of it. Two rivets, the pitch of which breaks joint in the breadth of the flange of the cross girders, are used and are sufficient for the purpose, although double that number are sometimes inserted. It will be observed that where the extra central flange plate is "dropped," a small packing strip is placed under the rolled joists, Fig. 1, so as to maintain the arched plates which are riveted to their upper flanges at the same level throughout.

It is not very often that the conditions of headway are so favourable as we have assumed, and admit of so simple and ready a manner of attaching the rolled joists to the cross girders. Very frequently they cannot be placed on the top flange of the cross girders, but must be fixed to the web, and it then becomes necessary to adopt another method, shown in Fig. 4. Instead of running along the tops of the cross girders, the rolled joists are in short lengths, and framed in between each pair of girders in the following manner:—Each of the rolled joists is riveted through its upper flange to the top flange of the cross girders, and through its lower to a piece of angle iron, as in Figs. 4 to 7. The angle iron is 6in. by 4in. by $\frac{1}{2}$in., and to assist its projecting flange, to which the rolled joist is riveted, a tee iron, $4\frac{1}{2}$in. by $2\frac{1}{2}$in. by $\frac{1}{2}$in. is riveted through it to another similar tee iron on the other side of the cross girder, Figs. 4 and 5. The tee irons on each side of the cross girders serve also to strengthen and stiffen the web which requires it, as in fact does the whole cross section of the cross girders at these points. Often the development of a weak line of fracture is unfortunately inseparable when junctions and connections of some of the principal component members of girders have to be effected. The only safeguard consists in a judicious arrangement of the connecting pieces, which should be all sections with ribs at right angles to one another, or, as they are sometimes termed, sections in two planes. Rivets should not be pitched too closely to one another, and the same rivets should go through and unite as many separate pieces in the connection as possible.

Part of the longitudinal section taken through the line F F in Fig 1 is represented in Fig. 8, in which M M is the main girder, R J the rolled joists resting on the cross girder shown in section in thick black lines, P the buckled or arched plates, over which is laid the concrete, upon which is spread a layer of asphalte, forming the surface of the roadway and footpaths. In Fig. 1 *c* is a part of the parapet screen, which is carried up to a certain height above the main girders. The particulars and manner of fixing it will be given in detail in another article. If the local authorities preferred no objection against the use of timber, the lower portion of the screen at *c*, which really acts as a ballast, or, as it is sometimes called, an "earthboard," might be economically and conveniently constructed of that material.

NOTES FROM PARIS.

THE season for building is now far advancing, and on all sides of Paris houses commenced early in the year are being covered in as fast as can be, and the interior plastering work completed, in order to profit as much as possible by the fine dry weather we are now having. Some of the more advanced of these houses are being pushed forward in order to be ready for letting for the October term, the most important term of the year. At Paris, as a rule, from six to nine months are estimated for the construction and complete finishing of an ordinary house for letting in flats; that is to say, a six-story house having five floors, each containing one or two complete apartments depending on the width of the façade; offices or shops on the ground floor, and single rooms in the attic story—these latter either for letting as extra rooms to the occupiers of the flats, or separately as bedrooms to outsiders. The number of these houses which have been built at Paris during the past two or three years, when the building trade has been in a slightly better condition than for some time, is surprising. In every quarter of the city numbers of these "maisons à loger" are being erected, the brilliant white stones of their façades contrasting strongly with the dirtier stone of the older and less-elegant houses. On the outer boulevards, these broad avenues containing two or three roadways and pavements, and one or two gravel-set avenues planted with trees between the opposite sides of the boulevards, the small houses of two or three stories only, and stucco façades are being pulled down, to give place to the six-story flats with more or less decorated stone fronts, for ground is rapidly increasing in value everywhere towards the faubourgs of the city; and these large houses, which often contain the population of a small provincial street, are much more profitable to the landlords. It is an advantage here to build in a solid and lasting manner, for the system of leasehold ground is unknown at Paris: all ground is freehold, and remains the lasting property of the person who buys it for building purposes, together with the building thereon. The Frenchman can scarcely understand the English system of leasehold property, and argues from this fact that buildings of the ordinary run in England must be of a rather light construction, built only to last a certain time with the certainty of the building at last, if it is still worth anything, falling into the hands of the owner of the ground, to the loss of the descendants of him who built it. The building and the ground are apart, and do not form, as here, one advantageous whole. To the west of Paris the new houses now erected are often most elegant and costly as regards façade, and large, commodious, and expensively decorated within. In these cases, when the surface of the ground for building is extensive, the house is built around a spacious courtyard, the ground floor of which is generally used for dependencies, stabling, &c. On the street front are the principal apartments, whilst others of lesser importance are grouped around the courtyard. One or two large staircases with convenient lifts lead to the apartments, and every new house is now fitted from top to bottom with water, gas, or electricity, and the latest sanitary improvements. The feature of these houses is the massive white stone front, decorated with artistic carving and architecture of one of the fashionable nineteenth century styles, with heavy projecting verandah windows, and bold stringcourses. The large entrance doorway forms an important feature, and often rises the height of the ground floor and entresol together, with massive doors or carriage way to the courtyard. The price of a moderate-size apartment in a good quarter, and containing drawing-room, dining-room, parlour, two or three bedrooms, and of course the kitchen and dependencies, is about £120; but prices vary from about £40 for a very small apartment, to several hundreds in the west end, for flats which are in themselves small palaces. The fronts of the Paris houses are in almost every case built out of solid stone; brick fronts are rarely seen. The interior walls are thick, the floors are always constructed of iron joists with plaster filling, the parquet being always of oak. The partitions are built of plaster slabs, and the roofs of iron and wood combined, with plaster filling between the rafters. The chimney flues are generally built up of earthenware pipes, either built into the walls or hung against them. All the walls are properly tied together at each story with iron bars running the length of the walls and securely anchored at each end. The whole building is thus essentially solid, and, as far as is possible, fire-proof. The method of estimating the cost of a building roughly at Paris is by so much the square mètre built upon—say from £28 to £50 per square mètre—and not as in England, at so much the cubic foot of walls and space.

Several of these most interesting and useful establishments, the Dispensary and Crèche, have lately been constructed here, generally in the populous quarters of the city, where they are destined to aid the poor inhabitants. At the dispensaries free consultations are given, medicine supplied, and cases of no especial seriousness treated. At the Crèche women who are obliged to leave their homes for work may leave their children, returning to fetch them when the day's work is over. The children are carefully looked after here, and benefit by the sanitary measures employed and the care which their parents are unable to give them. The last constructed of these buildings on the Boulevard de l'Italie, having a surface of about 2,000 yards, may serve as a model for this class of establishment. The building is kept somewhat back from the public roadway, and has behind it a large garden yard for the children to play in.

This building is composed of the offices and consulting-rooms of the doctors in charge, rooms for operations and special cases, with the necessary toilet rooms and dependencies. There is also a large consultation-room for children who are suspected to be suffering from some contagious disease. This portion of the building is separated from the rest by wide corridors, on the other side of which are the medicine dispensing-rooms and operation-rooms for minor non-contagious diseases. Behind these rooms is a small crematory furnace for burning all infected articles or clothing. The bathing portion of the establishment is very complete, and comprises a large bath-room for the daily bathing of dirty children, and divided into two portions for boys and girls. Each of these rooms has two dressing-rooms, where the children are dressed and undressed; the bath is given to one whilst the following is undressing, and so on, in order to obtain as rapid and discontinuous a service as possible. There are also rooms for medicinal baths for adults and children, and besides a large bathroom complete with all the apparatus necessary for the hydro-therapathic treatment of certain cases with contiguous dressing rooms. The Salles des Soupes, or refectory for the children, with kitchen and dependencies completes the building, with the exception of the cradle-room containing 40 cribs and couches, and the laundry. On its arrival each day each child is taken into the cloak-room, and undressed, and after bathing dressed with clothing provided by the Crèche, whilst the put-off clothing is cleaned and disinfected if necessary. The child is led to one of the places suited to its age, the crib-room, the baby-room, or the covered or uncovered garden. The building is heated by a new system of steam at low pressure; the sanitary arrangements of the establishment are of the latest improvements. The cost of the whole building was about £3,500, and it was built from the plans of Mr. Charles Adelgeist, architect.

In view of the new sanitary law for Paris, the Prefect of the Police has just issued new by-laws regulating the matter of sanitary arrangements in houses, and the proper methods of disposing of sewage and house refuse. These regulations are too long to give here, but it will be interesting in another letter to pick out portions for comparison with the regulations of the London County Council.

The magnificent buildings of the Louvre are now undergoing a thorough cleansing and restoration. The walls, columns, and capitals, as well as the ceilings, are being well washed and brushed with hard brushes, whilst all portions of ornament or sculpture in any way deteriorated are being replaced.

Masons and stone-cutters of Paris who have lately been grumbling at the lack of work attribute the cause to the manner in which building stone is taxed on its entry into Paris. The tax on the cubic mètre of dressed stone is the same as that for rough, unworked stone, and is 2s. 8d. the cubic yard. Now wages outside Paris being considerably lower than in the city, Parisian contractors, instead of having their building stone delivered in its rough state, order its delivery dressed ready for placing in position; the stone is, therefore, generally prepared at the quarries, where the wages given are about 2s. per day, instead of from 5s. to 7s., which the Parisian mason requires. Numerous meetings have been held in order to protest against this proceeding on the part of the contractors to the detriment of fair work at Paris.

The inauguration will shortly take place, at the Ecole des Beaux Arts, of the bust of Duban, the architect who restored the chateau of Blois, the Saint Chapelle, the chateau of Dampierre, the façade of the Louvre, and completed the construction of the Ecole des Beaux Arts. The bust of the master is of bronze on a marble pedestal, in which is carved the figure of a child and laurel branches. This little monument is the work of Mr. Guillaume.

A rather curious and unusual case of building rights is attracting considerable attention at Paris at this moment. No. 88 of the Rue des Martyrs, a well-known street leading up the hill of the church of the Sacré Cœur, comprises two large houses having the same staircase and entrance. One of these houses is the property of a Madame Vincent, the other has lately been bought by a Mr. Bonnard, who stipulated when buying that he would pay no ancient rights. The new proprietor, as soon as the sale was proved, forbid the inhabitants of the adjoining house the use of the staircase. The case was taken before the law-courts, where it was decided that Mr. Bonnard had a perfect right to erect a barrier between his house and that of his neighbour. After a short lapse of time the new landlord, acting on the decision given in his favour, ordered the passages acceding to the staircase from his neighbour's house, and those leading to the w.c.'s, to be walled up, thus imprisoning the tenants in their apartments. These latter are now obliged to leave their rooms by means of ladders in order to descend to the street, and haul up all their provisions by means of ropes from their windows, a position scarcely convenient for the tenants, but highly amusing to the passers-by and neighbours. This state of things, it is hoped, will not last, however, for several of the councillors of Montmartre are taking the matter in hand, in order either to arrange an amicable understanding between the joint proprietors of the staircase, or make an appeal to law.

The celebrated sculptor, Dalou, is actively working at the completion of the monument to Mr. Alphand, the late director and engineer of public work at Paris, and the chief engineer and organising spirit of the last Exposition of '89. This monument, which is being paid for by public subscription, will be entirely of stone, and will take the form of a hemicycle developing about 50ft., in the centre of which will rise the statue, about 11ft. high. Alphand is represented standing pointing out with his right hand four figures, representing Painting, Sculpture, Architecture, and Engineering Art. The artist, it is said, has the intention of giving to these figures the faces of well-known persons. Along the whole length of the hemicycle will be bas-reliefs figuring the public work done at Paris, paving, road-making, parks, &c. The monument will be, therefore, of no ordinary character, and will be essentially popular in style.

The decorative paintings executed for the staircase of the Prefet de la Seine, by Puvis de Chavannes, have just been installed at the town hall. The immense ceiling panel representing the Apotheosis of Victor Hugo forms, together with the allegorical paintings on the vaults and on the walls, an exceedingly harmonious *ensemble*.

From an official source we learn that the important work to be done for the enlargement of the Gare de Lyon is definitely decided upon, and that the proposed work must be furnished before the Exposition of 1900.

The town of La Rochelle has just made an acquisition of the celebrated house called Maison Henri II., which carries in its frieze the monogram of Diana of Poitiers. The house, which is a specimen of the purest and best proportioned building of the Renaissance, has since some time been inhabited by a shopkeeper. The house itself is situated in a garden, and surrounded by high walls. The town proposes to pull down the walls, and so place this perfect piece of architecture well in view; but, very wisely, it has been decided not in any way to tamper with the edifice by attempting to restore it.

At the Ecole des Beaux Arts the competitions and sketches for the month were for a cascade in a park, a dispensary for sick children, an athenæum, and a lecture-room for a school of art.

The list of the general classification of the various groups of exhibits for the Exposition of 1900 is now published, and gives the complete details of the method of classification for the groups of art, commerce, industry, agriculture, &c., with the many subdivisions. This list is too long to give here, but the principal divisions will be noted later on.

Arthur Vye Parminter.

COUNTY LUNATIC ASYLUMS.—IV.

By George H. Bibby, F.R.I.B.A.

THE ENGINEERING DEPARTMENT.

THE buildings containing the boilers and engines (*vide* E, Fig. 1) should be in proximity to the kitchens, laundry, bath-houses, and heating and ventilating plant, and at such a distance from the parts occupied by patients as not to cause them disturbance, noise, or annoyance.

The boiler-house should be arranged with space for a spare boiler or boilers to meet the requirements of possible future extensions or of any breaks-down that may occur. Ample space must be provided in front for the removal and repair of the boilers, and for cleansing, stoking, and general management.

In the engine-room space must also be provided about the engines and pumps for free access to all parts. In asylums where electric lighting is used, the dynamos may conveniently be placed in the engine-room, as thereby an economical arrangement may be obtained, and one man may easily manage engines and a limited number of dynamos; but the engine-rooms must be well lighted both by day and night, and there should be in connection therewith an office or room for the engineer, a fitter's shop, and store. If a steam fire-pump be provided, it may be placed either in the boiler or the engine-house, with a notice-board directing the officials generally (in the absence of firemen or engineer) as to the manner in which it may be brought into action.

For illustration, we will assume that the boiler and engine power are required for an asylum of 1,600 patients, and that it is necessary to provide power for driving the laundry machinery, the ventilating fans, the pumps for water supply, the hot-water mains for the baths and lavatories throughout the buildings—some of which would be at considerable distances; for a supply of steam for the coils and heating-pipes and ventilating extractor coils in the roof or elsewhere; also the power for an ample supply of steam and hot water for kitchen and scullery purposes. For such purposes it has been found necessary to provide ten high-class steel single-tube Cornish boilers, each about 25ft. by 6ft., and with all the usual fittings and double-action donkey-pumps, capable of feeding the boilers at the rate of about 5,500 gallons of water per hour. There would also be required engine-power to the extent of, say, about, 30-horse, and the fire-pumps before mentioned.

For an asylum of 1,600 patients the approximate cost for these works and materials would be not less than £8,000; but this item would be, of course, influenced by local considerations and the available means of transport. For a further sum of about £3,000 the whole of the buildings might be heated from the boilers by means of steam-supply. The waste from the steam-traps might be carried by means of wrought-iron pipes to an underground reservoir, and the water thus saved made available for feeding the boilers or for laundry purposes.

For an asylum of 1,600 patients, a tank to contain at least 150,000 gallons of water should be provided, either upon water-towers above one of the buildings, or in other suitable positions (a tank 50ft. by 60ft. by 8ft., or of equal capacity). This would (tank and contents) exceed 800 tons in weight.

In an asylum for 1,600 patients there would be required somewhat extensive provision in the event of fire. Say, two dozen 3in. gunmetal hydrants placed in suitable and conspicuous positions *within* the buildings, and there might probably be double that number fitted about the grounds; but in arranging for the positions of these, the architect would probably do well to consult a fire-brigade or other specialist. All the hydrants should be provided with lengths of good hose, and with provision for all other appliances for maintaining or bringing the apparatus into action. Near these should be means for filling the fire-buckets and nozzles for smaller hose.

These hydrants should be connected with the high-pressure constant supply main, if available, of the water company of the district where the asylum is situated; but as such a supply is frequently not attainable, it will be observed how necessary it is that a tank, or other means of supply, shall be well elevated, so as to obtain a sufficient force of water. If, therefore, the source of water is other than from the constant supply of a company (but brought to a suitable point on the site), a 4in. sluice valve and cover should be provided with a 4in. main to the tank, and be connected with the same by a rising-main fitted with a flange ball-valve, and the main of the same size should be connected with the steam fire-pump; but the fire mains to the various blocks may be reduced to 3in. or less provided an ample *force* of water is always obtainable in sufficient quantity.

All the fittings for the hydrants and all the appliances connected in any way with fire extinction, should be kept on boards or racks near to the hydrants, and spare materials and appliances should be kept in glazed cupboards (but protected from injury by the patients).

A suitable number of fire-buckets should be dispersed about the buildings, always three-parts filled with water and hung within reach. Approximately, the cost of the hydrants and fire-extinction appliances as above mentioned (for an asylum for 1,600 patients) would not be less than £2,000; while the cost for the hot and cold water-supply, with all necessary cisterns, tanks, water-waste-preventing apparatus, water-closets, lavatories, baths, slop-sinks, scullery sinks, urinals, pail-services, &c., would be in an asylum of this capacity not less than £7,000.

The various blocks of buildings should be supplied with auxiliary water-storage, giving a separate temporary supply in cisterns containing, say, 1,000gal. each. The contents of each of the hot-water cisterns may be about 200gal., and these might, if convenient, be heated with steam coils.

In connection with the foregoing items, it may be remarked that 1,600 patients would require, say, 600 lavatory basins, 130 baths, 320 water-closets, a large number of slop-sinks, &c., and a urinal for each ten patients.

An asylum for 1,600 patients would probably cost (under present methods) for electric lighting about £12,000, including wiring and supplying fittings for about 3,000 lights, engines, shafting, about eight dynamos and accumulators to give currents for 2,000 lamps for five or six hours, &c. (The boiler power would be included with the boilers first named.)

(The heating and ventilating engineering specially adapted for asylums will be mentioned at the close of these papers, and after the description of the wards for the patients.)

THE PATIENTS' WORKSHOPS, ETC.

In mental diseases suitably regulated degrees of activity and rest are amongst the most important means of treatment. So long as a patient is employed upon matters unconnected with his malady, he may be said to be in a great measure free from it, and by abstracting his attention from the insane ideas, these are more readily dispersed or weakened. A steady employment of the patient, especially when voluntary, is considered to be a decided indication of improvement, and is frequently the commencement of recovery. Those employments are best which keep the patient engaged in the open air, as in garden and field labour. These prove of great advantage, not only to the lower ranks who have been accustomed to daily toils, but also to the educated classes. Where the condition of the patient renders this impossible, household or mechanical modes of employment, chiefly of a light kind, are usually substituted. In chronic cases the learning of a new and agreeable trade will sometimes be most beneficial in interesting the attention. "Indigent patients should receive a small remuneration for their work during recovery. This might often prove a seasonable protection against want, and while the patients are to be restrained from unsettled trials of a variety of employments, every appearance of a manufactory, or regard merely to the pecuniary advantage of the institution is still more to be avoided—recovery of the patient should be the chief object of work."

In the five asylums for the county of London the patients in 1893 were thus divided :—

MALES.

Total employed	2,270
Unemployed	864
Sick, old, or infirm	916
Absent on trial	9
Total in Asylums	4,059

FEMALES.

Total employed	3,113
Unemployed	1,889
Sick, old, or infirm	1,107
Absent on trial	12
Total in Asylums	6,121

The above figures would probably give the minimum proportion of employed patients, as one of the asylums having only recently been opened, the workrooms and means of employment were not fully organised.

The architect may, however, take the following figures as indicating the nature of the employments and numbers of the patients engaged therein, and this may be a guide in arranging the buildings for workshops, &c.; in country and other districts, of course, other and varied occupations would prevail.

Where there are special and chronic asylums much larger workrooms must be provided for by the architect.

Absent on trial	8	10	8	12
Total in Asylum	5,069	5,368	6,009	6,121

For male patients, therefore, the upholsterers' shop must usually be of the greatest area; but rooms of ample size should be provided for the tailors, bootmakers, painters, tin-workers, wood-choppers, &c., and all these must have sufficient lavatory and w.c. accommodation, and store-rooms for raw and manufactured materials, tools, and implements.

For the female patients the work is simply sewing and mattress labour, and the domestic duties in the laundry, kitchen, and wards (*vide* S. R., Fig. 1).

The workrooms (*vide* W. R., Fig. 1) should be well lighted, and with, if possible, good prospects from the windows; there should, usually, be at least two doors to each workroom. The farm buildings also should provide means for a considerable amount of labour.

In an asylum (for about 2,000 patients) near London, the farm buildings provided accommodation for 8 horses, 40 cows, 1 donkey, 2 bulls, 11 heifers, 3 calves, 214 pigs, 224 fowls, 10 ducks, and milk, eggs, vegetables, and fruit are provided for the use of officials and patients in considerable quantities. The arable and pasture lands attached to the asylum in this case are less than 100 acres in extent, and the *buildings* would seldom have to be more than sufficient for such purposes as above indicated, although a large number of patients are employed upon the lands, orchards, gardens, grounds, roads, &c., generally.

THE POST-MORTEM AND PATHOLOGICAL ROOMS.

The mortuary should be placed at some distance from the view of the asylum inmates, and in connection with it the post-mortem room and pathological laboratory may be arranged. The junior medical officer of the asylum often makes the post-mortem examinations, but a special pathologist for a *number* of asylums has in one district been appointed, and an expenditure authorised of £4,000 for the erection of a pathological laboratory and museum for his use.

To a great extent, the clinical and other work of the medical officers, the absence of suitable laboratory accommodation, and other causes, have prevented exhaustive research; but it appears to be generally requisite that full means for the purpose should be provided in all large asylums.

It might in special cases be convenient to add a jury and waiting-room, with lavatory and w.c. accommodation, &c., a room for a bier, and other exceptional provision.

The pathological specimens are sometimes sent to the medical schools, but some authorities consider it desirable that these should be retained in the asylum museum.

CHURCH, LIBRARY, BILLIARD-ROOM, ETC.

In the great asylums for London, the obvious difficulties of providing for the various kinds of religious ministrations are less than in the provinces, and are, as regards one sect, met by forwarding Jewish patients to the Colney Hatch Asylum, where they are now in sufficient numbers to warrant the appointment of a special minister.

Catholic patients are also attended in various asylums by specially-appointed priests, with or without special chapels, in this country. In Ireland, however, in the large asylums, two chapels are often provided. Religious instruction is not usually withheld from any patient who desires and requires it; it would, however, be against the first principles of mental treatment to enforce such instruction. All efforts in this direction should direct attention from morbid representations, restoring healthful modes of thought. How far such ends should be attempted by these means is a question for the medical superintendent.

A well-appointed chapel must be provided near to, or adjoining, all asylums for the use of attendants and patients (*vide* S, Fig. 1). The arrangement should correspond generally with ordinary buildings of the class, but there should be added two rooms for those males and females who may be taken with fits during service, to which they can be instantly removed from the chapel.

The Commissioners in Lunacy suggest that the chapel shall be sufficiently capacious to meet the prospective wants of the asylum in case of an increase in the number of patients. It should generally be a detached building, easy of access, and capable of comfortably accommodating at least three-fourths of the patients, with separate entrances for the sexes.

There should be one or more libraries (vide U, Fig. 1), over which the chaplain would probably have some control, and a business room for this official might be placed *en suite*.

Billiard and club-rooms are often provided for the patients and officials, the higher officials having sometimes one of the former for their exclusive use. A music and a band practising room are also sometimes arranged for. The position and size of these depend upon the general arrangement of the asylum; but they should not be situated so as to cause disturbance to sick patients or those requiring quiet and rest.

The foregoing comprise the chief portions of the administrative departments. With regard to these and the buildings for patients, to be next described, the following extract is equally applicable:—

"A leading principle in the erection and whole internal arrangements, which has certainly been too often overlooked, is that all the household arrangements of an asylum should, so far as is consistent with its peculiar design, resemble those of a large private dwelling-house—that they should differ as little as possible from the houses and furnishings of the sane. On this principle all plans are objectionable which, by attractive peculiarities of architecture, such as steeples, turrets, &c., insinuate, even by their external appearance, that they are intended for some peculiar purpose. All prison-like cells on the one hand, and on the other undue magnificence in lofty halls, colonnades, &c., must, on the same principle, be avoided. It should throughout have the appearance of a medical institution, whose express aim is the restoration of health; it should convey the idea of ease, comfort, stability; it should also be cheerful and pleasant, with a scrupulous regard to cleanliness, which in such institutions should always be assiduously and perseveringly insisted upon."

SPECIFICATION WRITING.—III.*

(*Continued from p.* 482.)

ROOFER.—[REFER TO GENERAL CLAUSES.]

Tin-roof, under "Tinner."

Slate: — Quality, quarry, sizes, colour, grade, weathering. Tinned-nails, two to each slate, double at eaves, blind hips and ridges, cemented? snow-guards?—wire, at each joint, or other form of guard?

Tiles:—Kind, quality, bedded in hair-mortar? copper-nails? copper-wire? pattern, shapes, colour. Any conical roofs? special tiles. Tile-crestings, hip-rolls.

Tin-shingles:—Make. See "Tinner."

IRON-WORKER.—[REFER TO GENERAL CLAUSES.]

Stirrups, joist-sockets, bolts, rods, washers, shoes for trusses, upset ends, anchor rods and plates, straining-rods, bearing bars for openings. Iron carpet-strips, iron-bricks for screwing onto. Manhole rims and caps, cellar-gratings, window-bars, grilles, painted; patent process?

Store-gratings, galvanised? with hasps? padlocks?

Pavement hoist doors, cellarway doors, with glass? brass-hinges? Archimedian-lifts for cellar-doors?

Iron-stairs: Rails, posts, iron-treads, risers, rubber-tops? marble or slate treads and risers? in cut stone?

Steel-beams: — Lengths, widths, weight, angle-plates, connections, bolts, rivets, for floors, to have bearing-plates, painted before setting.

Columns, cast:—Thickness, bore for test, planed tops, bottoms, caps, bases—loose? drilled for bolts.

Columns, wrought:—Kind, make, length, required strength.

Brackets, struts, wrought? cast? for bolts? cornice-rods.

Clean-out doors. Ash-pit doors.

Fireproof-doors, vault-doors, no burglar-proof,—give all dimensions, thicknesses, fastening.

Iron-shutters:—Lugs for hinges? built-in? open from inside? open from outside?

Wrought window-frames? sash? sills outside? heads outside?

Iron-trusses refer to details, separate specifications. For trusses, contractor submit drawings.

Chimney-stack cap — cast-iron? wrought-iron? bolted? Expansion-bolts? Fire-escapes? Iron-gates, railings. Harness-hooks.

Feed-boxes, steel-wrought? cast-iron?

Iron-mangers: cast? wrought?

Water-troughs: This specified elsewhere.

Stall-guards: wire galvanised? cast-iron? wrought-iron?

Heavy-wrought strap hinges, special?

PAINTER, GLAZIER.—[REFER TO GENERAL CLAUSES.]

Old work:—Burn off? wash off? sandpaper? Putty-stopping nail holes, cracks. Shellac-stopping knots, sap.

Painting:—To sandpaper woodwork. Priming. Three coats paint. How many colours tints?

What kind of paint: Mixed or ground? what lead? any zinc? what colours? any make? all paint to have white-lead body? any ready-mixed paints? what make?

Ironwork painted? how many coats?

China gloss-painting? how many coats?

Enamel-paints: on tub? on walls?

Paint to be gloss finish? paint to be dull finish? painter to protect floors, stonework, etc., while painting.

Natural-wood:—Varnish: Any particular make? how many coats? Rub each coat.

Finish: Full gloss? dull polish? egg-shell finish? floors varnished? or wax finished?

Stained: What colour? Putty-stopping, coloured to match wood.

Shingles stained: What make of stain? what colour and number?

Porch floors painted? Porch ceilings painted or varnished? Walls or ceilings painted? sized? how many coats? colours?

Glazing:—Any floor-lights? rough-plate? how thick? Any skylight glass? rough-plate? how thick? In galvanised iron specification?

Plate-glass, specify windows, American? French?

American cylinder-glass, double strength, what grade? single strength. Chance's crystal sheet? French crystal? Ground-glass? Obscured glass? Glazed-doors—specify. Inside-windows.

Stained-glass? leaded? specify price per foot? omit? lump sum?

HEATER.—[REFER TO GENERAL CLAUSES.]

Hot-air:—Name make of heater; bricked in? who does it? Portable?

Specify size or make contractor guarantee and leave size to him.

Cold-air duct: brick? wood? terracotta pipe? from separate opening? if so, see that it shows on plan: from cellar-window? see that carpenter boxes in and sets sash. Does carpenter make box?

Bright tin-pipes to flues: Size, or leave to contractor if he guarantees. Dampers.

Registers: if not, where, tin-flues; if not, who.

If contractor guarantees, have flue sizes approved by him.

Heater should have shaking-grate, Mershon or approved, automatic-damper, water-tank.

All wrought-steel? All cast-iron? no combination. Galvanised-iron smoke-pipe, give thickness in trade term.

Hot-air and steam combined:—Name make. All other specification like hot-air, for hot-air, and steam, for steam. Galvanised smoke-pipe, give thickness trade term.

Steam:—Name heater, or contractor guarantee. Cast-iron sectional? wrought-iron? bricked in or not? Automatic-damper, shaking-grate, safety-valve, steam-gauge, water-gauges. Blow-off cock, into cellar? into well? not permitted in sewer.

Direct? what make of radiator? automatic air-valves nickel? wood-handle nickel-plated valves? Jenkins Bros.? nickel-bushings in floors. Radiators bronzed? painted? pipes bronzed? painted?

Direct-indirect? same specification as direct, but specify, radiator to be box-radiator, or "direct-indirect"—and specify galvanised-casings to outside air, through walls, provide gratings, or from cellar on first floor. If from cellar, provide cold-air ducts from cellar window, galvanised-iron, say twenty-two gauge.

Indirect: Name radiator; air-valves automatic, brass-seat valves? Jenkins Bros.? radiators hung from joists? on proper irons?

Cold-air supply: Galvanised-iron, name thickness, flat ducts, curved angles, duct to open through wall; if so, see that opening is shown on plan. Radiator-boxes, same galvanised-iron, put together with bolts, or pins, to come down, roofs of boxes, pine, tin-covered.

Does contractor provide flues? registers? or are they in other trades? if so, what trades?

Guaranty invariable. Written, sealed, to seventy degrees in zero weather,—also against water-hammer in pipes, not over ten pounds of steam to be necessary to heat.

---

* A lecture delivered before the Architectural Department of the University of Pennsylvania, by Mr. T. Roney Williamson, Architect.

Or does the contractor provide specifications with bid under the same guaranty? Any hot-water heaters? coil?

Large plants, with extended work, fans, pressure or exhaust, special expert specifications.

Steam-heat from power-boilers, reducing-valves, to heat system, return-pipes to tank and pumps.

Power-boilers: horizontal? tubular? upright? steel? Harrison safety? Babcock and Wilcox, safety? All to be tested to carry one hundred pounds, special work more. Boiler Insurance Company's certificate to be delivered to owner.

Engines: Take specifications and guaranty from bidders. Refer to experts.

ELECTRICAL WORK.—[REFER TO GENERAL CLAUSES.]

Special specifications:—Refer to Underwriters' Association. Make contracts subject to inspection approval of Association and observance of all rules of Insurance Company.

Dynamos:—Special specification.

Call-bells, annunciators, buttons, pulls, batteries, wire insulated, run in tin tubes. Kind of buttons, as to finish. Pull at front door to match furniture. Annunciator to have names of rooms, &c.

Hotel annunciator: Take maker's specification.

Lifts:—Hydraulic? electric? direct steam? city water pressure hydraulic? name maker; Ellithorpe safety-cushion? other safety-brakes? Does contractor furnish car? Own design? Your design? Gas to car? electricity to car? annunciator and buttons. Does contractor furnish?

Electric stop and start, safety? method of control, rope? winch? lever? guides, wood? iron? machinery, take maker's specification. Refer to expert. Guaranty to cover speed, and durability. Require insurance and inspection from insurance company.

Hand-hoists:—Require specifications from makers. Guides at back? at all corners? at two corners? friction and ratchet safety-brakes, hatchway-doors? automatic-bars? brake and rope through stories.

Carriage-hoists:—Same. Friction automatic safety-brakes, brake and rope on band wheel.

Pavement-hoists:—Take maker's specifications, generally winch-hoists, chain-cables.

◆

NOTES FROM THE ANTWERP EXHIBITION.

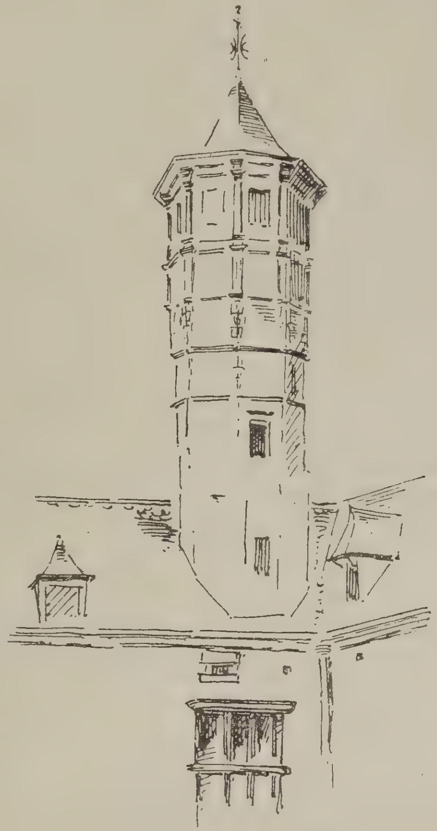
PART III.—THE ARTS.

In taking notes upon the artistic side of the Antwerp Exhibition, difficulties at once arose. The desire was natural that these Notes should mainly take the form of sketches; but, unfortunately, it is prohibited to sketch the buildings, one firm having purchased the sole right of selling illustrations of them, and it is also prohibited to sketch the exhibits, for fear that designs might be reproduced. Real ignorance of these prohibitions, however, allowed of one sketch of old Antwerp being obtained and just completed before the courteous intimation came that it was not allowed; and feigned ignorance, both of the rules and the language, secured two others of metalwork, it being deemed inadvisable to waste a portion of exceedingly limited time in seeking a special permission which might have been withheld.

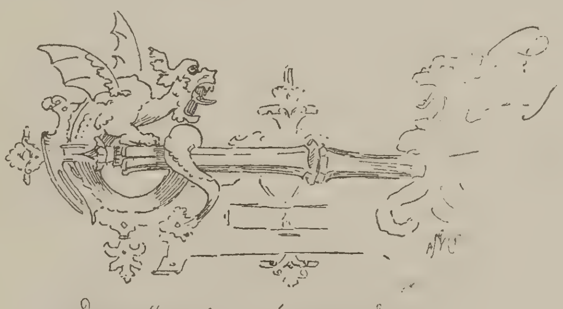
Architecturally speaking, the best thing in the exhibition is undoubtedly the representation of Old Antwerp. It is far and away the best representation of an old town which has yet been erected in this way—in all respects national—with every characteristic of the Flemish work of the immediate neighbourhood of Antwerp and Malines, and, strange to say, with no admixture of that of Bruges or Ypres. The small sketch, obtained as stated above, is no fair criterion by which to judge, having been intended but as a prelude to a greater effort; but it will in some way show the class of work, and Old Antwerp should yet be visited, before the Exhibition closes, by architects in search of inspiration, particularly if they have it in them to both refine and embolden the wiry Flemish work, and to carry away in their minds what they are not allowed to sketch.

Of the Exhibition buildings themselves, it can only be said that the entrance is better than such erections usually are. It is American, and not European at all in taste—more like a copy of the Chicago buildings than anything else with which it could be compared.

Within the Exhibition it is natural to turn first to what are considered to be the two national arts of Belgium—wood-carving and hammered metal-work; and it is a considerable disappointment to find but little of either. Of the woodwork, what there is is really good, but it is almost entirely confined to furniture. Here there is a buffet, there a table, and there, again, a few chairs, showing what the carvers are capable of doing to a small extent; but the beautiful figure-carving of which so much is to be found in the churches of the country, of both past and present, is conspicuously absent.



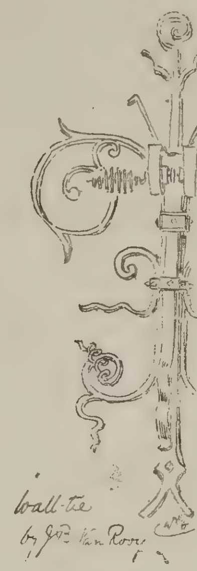
A BIT OF "OLD ANTWERP."



Door Handle in Wrought Iron.
by G Chouanard of Brussels

Of metal-work there is a better display; but unfortunately the smith seems generally to have thought that for exhibition purposes it was desirable to try his skill in reproducing vines and oak branches—in fact, to put iron to wrong rather than to right uses. Notable exceptions are the exhibits of door furniture and of hanging lamps, some in wrought iron and others in hammered and pierced brass. Of these there are a great number, many of them exceedingly crisp in design and execution, as is the door-handle of which a sketch was obtained. The wall-tie is in reality a somewhat stiff piece of work, but it is characteristic—an essentially Flemish feature, the use of which, even in its more simple forms, adds considerably to the picturesqueness of a building.

The best exhibit of hammered work, however, is not in the Belgian, but in the Austrian, Court, where Herr Ludwig Wilhelm, of Vienna, makes a splendid show of hammered iron and steel, well-designed and sturdy work; a steel fire-screen, and an electrolier and a gas-lamp of wrought iron particularly claiming admiration. Sketching here, however, was stopped at once upon the usual pretext. Query—Are these people as afraid to publish illustrated catalogues as they are to let others sketch their designs?



Of course, stove fronts are in considerable evidence, generally in brass, and of all degrees of excellence. All are not equally good, unfortunately, and it may generally be said that the cast work in all metals is wanting in finish and none too well modelled. It is the smith who excels, and not the founder.

In the Dutch Court there is a beautiful small exhibit of ecclesiastical embroidery by Messrs. Janssen, of Tilburg, comparing very favourably with more pretentious efforts in the same direction in other courts; and the Dutch are easily first again in the exhibit from their schools of design, in spite of competition with those o other European countries. The clean wood carving, and the beautiful studies of form and colour, are worthy of much careful attention by our own students, both for crispness and exactitude.

◆

The City Commissioners of Sewers adopted, on Tuesday, a report directing that steps should be taken with a view to the introduction of a Bill in Parliament to obtain powers to provide baths and washhouses within the City, and that in the mean time a draft Bill should be prepared. The acquisition of the necessary powers—of which the City Commission are now deficient—is the only object of the Bill, and not necessarily the erection of the buildings, which, a member said, would cost £100,000. At the same meeting it was decided to carry out a street improvement in Dean's-court and St. Paul's-churchyard, at an estimated cost of £1,995.

"BUILDING NEWS" DESIGNING CLUB.

AWARD OF PRIZES, SESSION 1893-94.

THE seventeenth year of our Designing Club was marked by good work, and the results obtained by the leading members show how, in the competitions month by month, they ran neck and neck with each other. The following is the actual record :—

A.—A Village Library and Technical Institute.—"Nitor," 1; "Birmingham," 2; "Esperez Toujours," 3; "Scottana," 4; "Kenilworth," 5.

B.—A Small Theatre.—"Kelso," 1; "Ant," 2; "Nitor," 3; "Zenith," 4; "Robe," 5.

C.—A Country House in Half-Timber.—"Ant," 1; "Pecksniff," 2; "Scottana," 3; "How's This?" 4; "Boomerang," 5.

D.—Block of Seamen's Almshouses.—"Nitor," 1; "Boomerang," 2; "Ant," 3; "Kelso," 4; "Scottana," 5.

E.—A Small Town House.—"Nitor," 1; "Kelso," 2; "How's This?" 3; "Boomerang," 4; "Idea," 5.

F.—A Village Market Hall.—"Ant," 1; "Nitor," 2; "Kelso," 3; "Boomerang," 4; "Unconscionable Scot," 5.

G.—A Cocoa Tavern.—"Boomerang," 1; "Ant," 2; "Nitor," 3; "How's This?" 4; "Kelso," 5.

H.—A Pair of Labourers' Cottages.—"Nitor," 1; "Boomerang," 2; "Scottana," 3; "Kelso," 4; "Ant," 5.

From this list it will be seen that the winner must without doubt be "Nitor," as he takes the first place four times, is once second, and third twice. "Ant" was twice first, twice second, once third, and once fourth. "Boomerang" wins over "Kelso" by one point only. Thus he was first once, twice second, twice fourth, and once fifth, whereas "Kelso" was once first, once second, once third, twice fourth, and once fifth. "Scottana" ranked twice third and once took fourth and fifth places. "How's This?" was once third and twice fourth. Both these last-named competitors did good even work, and although they never took first or second positions, their productions were serious and workmanlike. "Kelso" made a continued and well-sustained endeavour to beat his previous record; but his plans sometimes handicapped his chances, which is a pity, because occasionally the designs contributed by him were worthy of more care in this respect.

We award the prizes in accordance with the results of the competitions as follows. "Nitor," 1st prize of £10 10s., Mr. R. Shekleton Balfour, 76, Inverness-terrace, W.; "Ant," 2nd prize of £5 5s., Mr. Charles A. Battie, 462, Hornsey-road, Hornsey Rise, N.; "Boomerang," 3rd prize of £3 3s., Mr. Henry A. Crouch, 2, Great Coram-street, Russell-square, W.C. Hon. mention is obtained by "Kelso," Mr. W. A. Forsyth, Belsize-road, N.W., "Scottana," Mr. T. Ballantine, 16, Hornton-street, Kensington, W., and "How's This?" Mr. A. W. Newman, Bloomsbury-square, W.C.

RULES OF COMPETITION FOR SESSION 1894-5.

1. Drawings to be sent in within 28 days after the publication of the particulars of subjects.

2. One or more subjects will be given every month, from which a competitor may choose.

3. The drawing to be executed in firm black lines on white drawing-paper, in sheets of the absolute size of 22in. by 14in., with no washes or tinting in colour whatever. Outline to be the first consideration; but drawings may be slightly shaded with shadows executed wholly in line. Sectional parts to be shown in ruled "hatching," or blocked in. The scale to be used will be given with each subject.

4. Drawings to be forwarded unmounted, by post, care being taken to roll the short way of the drawing, as packages over 18in. long are not transmissible through the book post.

5. On entering the class (which may be done at any time) each competitor is required to furnish his name and address, which must be written legibly on the back of each drawing, as a guarantee of good faith, the *nom de plume* the author intends to adopt boldly marked on the front of each separate drawing.

6. Prizes of £10 10s., £5 5s., and £3 3s, will be awarded to the best series of designs. Our decision to be final.

7. Before awarding the prizes any contributor will be expected to furnish proof, if necessary, as to his age, and the time during which he has been engaged in professional pursuits, though no candidate need be strictly an architectural student.

8. We reserve the right of arranging the drawings for publication in any manner we deem necessary.

9. A critical notice of the designs sent in of each series will be given in an early issue following the receipt of the drawings.

FIRST LIST OF SUBJECTS.

A.—*A Moorland Church*, with a Sunday schoolroom attached, and a shelter adjoining for carriages. The church to seat 200 persons, including two priests' desks and choir-stalls for six men and eight boys in chancel. Provide a commodious vestry, with a fireplace in it, and provision must be made to protect the entrances, as the site is an exposed one. The land on the mountain side falls from west to east 1 in 14, and from north to south rather more than 1 in 8 in irregular contours. The chancel is to be furnished with an organ, and be arranged properly, with altar pace seven steps above level of nave, two steps being at entrance to choir, where there is to be placed a simple rood screen in oak on a stone base. No aisles to nave, but a small tower with spire. A covered way is to connect the Sunday schoolroom with the church. This room to be available for parish meetings, and to measure 45ft. by 22ft. inside, or be of that area. The shelter is to be suitable for carts and carriages standing during service for the use of those driving to the church. The difference of level in the site may permit of the shelter being continued under the school, if desired. Stone and slate to be the material used, and the design is to be simple in detail, with solid and sturdy proportions. Scale 8ft. to the inch. Plans, two elevations, and view. The plans may be drawn to 16ft. to the inch if necessary; but they must show the seating arrangements intended.

BOOKS RECEIVED.

Thermo-Dynamics, by J. PARKER, M.A. (London: Sampson Low, Marston, and Company, Ltd.), is a treatise on a subject of increasing value and interest in physical science. The author has treated the subject in a clear and concise manner, with the aid of elementary mathematics of simple algebra and the trigonometry of sine and cosine. The author discusses the conservation of energy in a clear and instructive manner; the old "caloric" theory and the earlier investigations of the founders of a more rational theory of heat, including Count Rumford, Davy, Carnot, Mayer, Joule, are described. Mr. Parker next discusses "Perfect Gases"; "Carnot's Principle," and its application to an unelectrified body at rest. Chapters on "Tidal Friction," "Applications to Electricity," &c., are interesting. Mr. Parker's work is a little too advanced for the beginner in this branch of physics; but for the student who knows something of algebra and the principle of energy as given in most rudimentary books, this treatise will be found valuable, especially as it contains applications to animal and vegetable life, tidal friction, and electricity.——*Building Construction*, by CHARLES F. MITCHELL, Lecturer on Building Construction to the Regent-street Polytechnic, London, M.S.A., &c., assisted by GEORGE A. MITCHELL; Advanced and Honours Courses (London: B. T. Batsford).—Mr. Mitchell's treatise is a valuable addition to the textbooks suited for architectural students, and is compiled to assist them in preparing for the May examinations of the Science and Art Department, the R.I.B.A., Surveyors' Institution, &c. The author has kept in view the requirements of his own students, and has in this advanced course touched on many matters which are only dealt with in a very elementary manner in his earlier work, which we reviewed some time ago. In its compilation the author has consulted many of the acknowledged authors and compilers of handbooks. The "Notes on Building Construction" and Col. H. Seddon's "Builders' Work" have been laid under contribution, as well as articles in the BUILDING NEWS. Taking at random a few of the chapters, we find them up to date and concisely arranged under paragraphs. Brickwork is fairly treated, and some plans of bond given. The stability of walls is explained by suitable diagrams and simple formula or equations, and Rankine's investigations and tables are given. Tall chimneys and sewer construction receive attention. The author devotes one chapter to graphic statics, which is simply and clearly explained by diagrams. Girders, fire-resisting construction, sanitation, hot-water apparatus, &c., are also treated. As a compendium of the trades connected with building in their constructive aspect, Mr. Mitchell's book will be found of much service as a preparatory handbook to more special treatises. The illustrations are well drawn and numerous.——*Practical Stair Building and Handrailing*, by W. H. WOOD (London: E. and F. N. Spon, Strand), is a practical method based on the square section and falling line system. The letterpress and plates of diagrams are clear and drawn to a good scale. The method adopted by Mr. Wood is somewhat on new lines, but will be intelligible to any student who carefully studies the work. The author lays down the centre line of rails first, and the tangents and face of risers are drawn. Next the centre line is unfolded or developed on a board, with positions of risers thereon. The falling line of rail is then drawn. The advantages claimed are several: the tangents are made to conform with the falling line of rail instead of the reverse; the wreath being sawn out to the section lines, instead of vertical, saves time in squaring; it is easier to moulds than is the case with cylindrical wreaths, and the system has all the advantages of the falling moulds without the trouble of getting them out. Other advantages are stated. The elementary problems are well selected, and the plates are larger and fuller of details than those generally met with in books on staircases and handrailing.

CHIPS.

Lord Kelvin unveiled a statue of the late Sir William Pearce on Saturday, in the borough of Govan. The statue is in bronze, of heroic size, by Mr. E. Onslow Ford, A.R.A., and has been subscribed for by the shipbuilding and engineering operatives of the district. The deceased is represented as examining the plan of a ship inscribed on an open scroll.

Before deciding upon the details of the proposed new Naval Barracks at Chatham, which will be on a somewhat extensive scale, the Lords of the Admiralty will consider a report upon the subject, which is being specially prepared at their request by Rear Admiral Ernest Rice and Mr. William Crisp, from the Director of Works Department at the Admiralty. Admiral Rice and Mr. Crisp visited Chatham on Saturday, and inspected the proposed site. The conversion of the old prison buildings will form a small part of the scheme.

The new English Church of St. George and St. Boniface, in Freiburg, Baden, was dedicated on Wednesday week. The town presented the site, which is valued at £1,200.

The town council of Crewe have remitted to a committee the preparation of a scheme to build a school of art and technical institute at a suggested cost of from £2,000 to £3,000.

The stained-glass windows and the memorial brass erected at St. Augustine's, Highbury New Park, as a memorial of the late Prebendary Calthrop, were designed and executed by Messrs. Alexander Gibbs and Co., 21, Bloomsbury-street.

A service was held at the church of St. Mary the Virgin, Burghill, Herefordshire on Saturday, the occasion being the dedication of the restored and new bells. The old peal of five bells were cast in 1704; of these two were cracked, and the old framework was so decayed that it was unsafe to ring the remaining three bells. The restoration consists of new oak framework and flooring. The three uncracked bells have been quarter-turned, the two cracked bells have been re-cast, and three new bells added, thereby completing the octave. The peal has been hung by Mr. W. Greenleaf, of Hereford. The second and tenor bells were re-cast by Messrs. Mears and Stainbank, of London, who also provided the new ones.

The pressure-reducing and regulating tank for the North Pentland water has just been completed at Firhill, Craiglockhart. The tank is 112ft. square with a depth of 20ft., and a capacity of a million and a half gallons, and it is built entirely of brick. It has cost about £10,000.

An inquiry was held at Mevagissy, Cornwall, on Friday by Mr. Arnold Taylor, Local Government Board inspector, into the application of St. Austell rural sanitary authority for sanction to borrow £2,000 for works of sewerage in Mevagissy. Mr. J. Thomas, M.I.C.E., produced and explained the proposals.

The ancient gold ring or amulet, which was recently discovered in a building estate in Daubeney-road, Hackney Wick, and which is believed to be one of 16 amulets made in accordance with the directions of the will of Sir Edward Shaw, goldsmith and alderman of the City of London in 1487 as charms against diseases, has been deposited in the British Museum.

MATER INFIRMORUM HOSPITAL, BELFAST.—FLEMISH HOUSES OF THE SEVENTEENTH CENTURY.—SEMI-DETACHED VILLAS, NEWPORT, MON.—KINGSTON-UPON-HULL BRANCH LIBRARY—TONG CHURCH, SALOP.—WAREHOUSE AT HOVE.—SCHOOL AND MISSION-ROOM AT HOVE EDGE, BRIGHOUSE.—OAK PULPIT, IRON ACTON CHURCH, GLOUCESTERSHIRE.

Our Illustrations.

THE MATER INFIRMORUM HOSPITAL, BELFAST: SELECTED DESIGN.

This week we publish the plan and perspective view of the design for this work placed first in an open competition. Mr. Thomas Drew, F.R.I.B.A., acting as assessor, says in his report to the Most Rev. Dr. McAlister that: "Fourteen designs were duly delivered to me. Anonymity has been successfully preserved. I am pleased to say that, until after the order of merit of the designs was definitely fixed, and the sealed envelopes were opened, the assessor was without hint or surmise as to the authorship of any design." Mr. William Fennell, M.R.I.A.I., whose design was placed first by the assessor, has received instructions to call tenders for the work. It is proposed to expend £20,000 on the work.

FLEMISH HOUSES OF THE SEVENTEENTH CENTURY AT ANTWERP, MALINES, AND YPRES.

The occupation of Belgium by the Spaniards in the 16th century produced marked differences in the character of the buildings. Many of the street frontages are of great interest. Those shown, though far apart, have similar characteristics, and are good examples of the treatment of large window-spaces. The measured sketches, which form the subject of our illustration, are from a pencil-and-brush drawing by Mr. John B. Gass, F.R.I.B.A., of Bolton.

SEMI-DETACHED VILLAS, NEWPORT, MON.

The illustration shows a pair of semi-detached houses, designed by Mr. W. L. Griffiths, architect, 27, High-street, Newport, Mon., and proposed to be erected in the suburbs of Newport, Mon.

SELECTED DESIGN FOR PUBLIC LIBRARY, KINGSTON-UPON-HULL.

We illustrate herewith the chosen design for this branch library, for which Mr. H. A. Cheers is the architect, and the builders executing the work are Messrs. Bowman and Sons, of Stamford. The site is on the Beverley-road, and the cost is about £2,000. The plans show the accommodation, including the lending library and reading room, the committee-room and book-repairing room being on the first floor. No provision was required for a librarian's residence. The materials used are red brick and stone dressings.

TONG CHURCH, SHROPSHIRE.

This sheet comprises three views and a plan of Tong Church, one of the most interesting of the entire Salopian series, and we are indebted to Messrs. Hobson and Co., of Wellington, for the photographs thus reproduced. They are selected from "An Architectural Account of the Churches of Shropshire," by Mr. D. H. S. Cranage, M.A., of King's College, Cambridge, the first part of whose work has just lately been published, with collotype permanent plates from photographs specially taken for the book by Mr. Martin J. Harding, the plans in each case being drawn by Mr. W. Arthur Webb, A.R.I.B.A. The choice of subjects with which the undertaking is thus inaugurated includes the churches in the Hundred of Brimstree, the gem of the collection being unquestionably St. Bartholomew's Church, at Tong, which can be seen from the line shortly before reaching Shrewsbury from London. About two years since Mr. Ewan Christian had the church in hand for restoration; but not having seen it since, we cannot give an opinion upon what was then done. The old work was in a very good state of preservation, and the tombs, which form the glory of the church, have escaped mutilation, and so furnish a wonderful record of armour and costume from the beginning of the 15th to the early years of the 17th century. The plan shows their position in the building, which was mainly erected in the first part of the 15th century. The choir stalls and the Vernon Chapel seem to be somewhat later, the latter dating, in fact, from 1515. The woodwork in the church is particularly good, and it is of interest to note the flavour of Decorated work still lingering in the details of the Perpendicular windows and other architectural features in the chancel, which still preserves its original roof. The Mediæval embroidery hung in the vestry is said to have been worked by the nuns of the neighbouring convent of White Ladies some 350 years ago. The tombs are thus numbered chronologically on Mr. Webb's plan. No. 1. Sir Fulke de Pembruge and his wife; he was lord of Tong in 1371, and died about 1409. No. 2 commemorates Sir Richard Vernon and his wife Benedicta; he was Speaker of the Parliament held at Leicester in 1426, and died in 1451. The upper right-hand photograph on our plate shows the elaborate canopy work on the flanks of the monument, with angels and saints bearing shields in the niches. The carving is excellent, and the whole tomb is in alabaster. No. 3 is the tomb of Sir Wm. Vernon and his lady. No. 4, shown by the lower interior view, records the memory of Sir Henry Vernon and Lady Anne, the founders of the Vernon Chapel. He was guardian and treasurer to Arthur Prince of Wales, the elder brother of Henry VIII. This monument is situated under a Burgundian arch opening into the chapel, and there are some denuded canopies above on the wall, from which the images have gone. The work is somewhat Debased in style as compared with the earlier work. No. 5 is the tomb of Richard and Margaret Vernon. No. 6 probably commemorates Humphrey and Alice Vernon, whose figures are incised on a slab. No. 7 is a lately re-discovered brass to Sir Arthur Vernon, Rector of Whitchurch, and over the figure of this priest, which is well preserved, is a chalice and paten. Nos. 8 and 9 form a very elaborate Elizabethan monument, with circular arches in the lower part and Doric shafts at the sides supporting an entablature and cornice. Four obelisks emphasise the corners of the tomb. The upper figures are those of the Hon. Sir Thos. Stanley, second son of the third Earl of Derby and his wife Margaret. She was the co-heiress of Sir George Vernon with Dorothy Vernon, of Haddon Hall fame. Sir Thomas Stanley died in 1576, and was succeeded by his son, Sir Edward, who is represented below; he died in 1632. Mr. Cranage has carefully described all the costume and other details of these monuments, and his remarks evidently are thoroughly careful and much to the point, showing a critical knowledge which is architecturally reliable, and not encumbered with too much of the husk of archæology. Shiffnal Church has a character about it, and Worfield Church, with a curiously-placed tower, has the advantage of a very good spire; while Claverley Church has an earlier tower, incorporated in a very uncommon way, in the south aisle. The other churches of this district lack interest; but in all cases justice is done by the work under notice. We shall look to the other parts as they are issued to include some of the more noticeable ecclesiastical buildings of the county, as this first contribution augurs well for the permanent value of Messrs. Hobson's publication. The domestic buildings of Shropshire would make a very valuable sequel to such an admirable topographical and architectural book as that before us, particularly if accurate plans could be given.

WAREHOUSE AND STABLING, HOLLAND ROAD, HOVE, BRIGHTON.

This building is now in course of erection for the Brighton and Hove Co-Operative Supply Association, Limited, and is about one hundred yards north of their present building at Hove. It comprises, in the basement, large cellars and safe-deposit rooms under the whole area of the building and yard; on the ground floor, stabling for thirty horses, harness-room, van-houses, warehouses, and yards; on the first, second, and third floors, furniture warehouse and forage stores. There is a hydraulic lift from the basement to the top floor. The building is being erected of stock bricks faced with red bricks from the Cranleigh Brick Company, and relieved with buff-coloured terracotta. The roof is covered with green slates. The building is fireproof. The contract price for the building was £9,121. Messrs. Lainson and Son are the architects, and Mr. James Barnes, of Brighton, is the builder. The design of the building is a simple rendering of the French Renaissance.

SCHOOL AND MISSION-ROOM AT HOVE EDGE, BRIGHOUSE.

The accompanying illustration shows the Church of England elementary school and mission-room, now erecting at Hove Edge in the borough of Brighouse. The plans, which have received the approval of the Education Department, have been prepared by Mr. George Hepworth, architect, of Brighouse, under whose supervision the works are now being carried out. The building is two stories in height on the north and west sides, advantage having been taken in the fall of the ground to secure a fine set of rooms under the main school. The upper floor will be on a level with the road, access being gained by porches on the east and south sides. The large room on the ground floor is intended to be used as a mission-room as well as for school purposes. The building is erected of pitch-faced wallstones from the adjoing quarries, and the roof is covered with green Westmoreland slates and red terracotta tile ridges.

PULPIT, IRON ACTON CHURCH, GLOUCESTERSHIRE.

This is an interesting example of Early 17th-century work, 1624 being the date of its erection, which date is shown on the panel at the back of pulpit, together with the names of the vicar and churchwardens of that time. It is constructed entirely of oak, and is in a good state of preservation, having been carefully restored some years ago. It is highly probable that it was originally entirely decorated, as is usual with work of this period; but now no traces of colour remain, except in the panel containing the inscription. The staircase is almost entirely a modern restoration. The church is a good example of Early 15th-century work, and in the churchyard is an extremely elegant covered preaching-cross, now much mutilated.

R. Gammell.

CHIPS.

A water supply is being provided for the village of Coleford by the Frome rural sanitary authority. Mr. Purnell is the engineer, and Messrs. J. and U. Wilcox are the contractors.

The Conservative club on Star Hill, Rochester was reopened last week, after enlargement of the meeting hall, at a cost of £500. Mr. W. F. Boucher, of Rochester, was the architect, and Messrs. Callund and Sons, of Rochester, the builders.

Col. Luard, R.E., an inspector from the Local Government Board, held an inquiry at the Guildhall, Ludlow, last week, with reference to an application by the town council for sanction to borrow £6,500 for purposes of sewerage and sewage disposal, and £300 for works of water supply. Mr. Pollard, of the firm of Pollard and Tingle, architects, explained the proposals.

The fourth general meeting of the Royal Society of Antiquaries of Ireland for the year was held at Dublin on Tuesday afternoon. On Wednesday places of interest in the Old City of Dublin were visited, under the guidance of Mr. J. L. Robinson, R.H.A.

A cross has recenly been erected in the cemetery at Bishop's Stortford over the graves of Dr. and Mrs. J. F. Waller. The memorial consists of a replica of a Celtic cross. The cross itself is a fine monolith in blue Pennant stone, resting on a triple base of the same material. Around and about it 142 superficial feet of ground is inclosed by a curbing, also of Pennant stone. The work has been carried out by Messrs. Harry Hems and Sons, of Exeter.

WAYSIDE NOTES.

Further excavations recently made on the site of the Anglo-Saxon Cemetery on the top of High Down Hill, near Worthing, have yielded some interesting results. The ground has been trenched under the direction of Mr. C. H. Reed, of the British Museum, who regards it as the largest and most important Saxon cemetery yet found in Sussex. Many interments have been traced. The most notable discovery has been that of a collection of glass vessels, which vie with those of the same period now preserved in the British Museum. One of these is described as shaped like a tall wineglass without a stem, and ornamented with loops of thick white glass. Another is a vase of slender shape, with raised figures and some Greek characters upon it. In one grave some fifty or sixty small beads were found. In another grave, in which part of a child's skull was recovered, were found several glass beads and some thin discs of bronze, decorated with a pattern composed of dots and perforated, as well as a thick ring of bone or ivory, which, it is conjectured, might have been a plaything, or possibly a teething ring. Most of the bodies, but not all, are buried from west to east.

The Jules Dupré Monument was last Sunday unveiled at L'Isle Adam. It stands facing the street in which that great landscape painter lived for 50 years. The monument takes the form of a small semicircle in the centre of which is a dwarf building, like the portico of a Greek house. A bust is placed on a pedestal between two Doric pillars. Above, between two curved palm branches, are the arms of L'Isle Adam. In front of the bust, and in the basement of the portico, water falls from a lion's mouth into a marble basin. M. Scellier, an architect at Givors, and son-in-law of Dupré, designed the monument. M. Roujon represented the Minister of Fine Arts. He and M. Français, the eminent landscape painter, were the principal speakers.

Two curious and ancient specimens of ecclesiastical architecture were reopened to the public last Saturday and Sunday. The first is the old crypt of St. John's, Clerkenwell (formerly the Priory Church of the Knights of St. John of Jerusalem), chiefly famous as the place where the Cock-lane Ghost was discovered to be an imposture. Now the crypt has been relieved of all nauseous contents, and reveals a notable and striking example of old and strong masonry. The second is the historic Church of St. Michael's Paternoster Royal, College-hill, Cannon-street, which was reopened after extensive restorations. The edifice was "new-built" by Sir Richard Whitington, several times Lord Mayor of London. Sir Richard himself was buried three times in it —first by his executors, "under a fair monument"; then in the reign of Edward VI., when "the parson of this church, thinking some great riches (as he said) to be buried with him, caused his monument to be broken, his body to be spoiled of his leaden sheet, and again, the second time, to be buried; and in the reign of Queen Mary the parishioners were forced to take him up to lay him in lead as afore, to bury him the third time, and to place his monument, or the like, over him again, and so he rested."

English sculptors are not half up to date—perhaps because our fewer political changes have not sharpened their wits. The Parisians just now are laughing at the vicissitudes of a bust of Louis XIV. over the colonnade on the east side of the Louvre. When Perrault erected the colonnade the bust was an exact likeness of the "Roi Soleil," but under the First Empire the official sculptor chipped off the flowing wig, and pared the nose down to the Napoleonic proportions. When the Bourbons came back, the wig was replaced, and the necessary hump put on the nose, but both were removed during the Hundred Days. But after Waterloo the perruque and the aquiline nose were restored, and the troubled bust had rest, though now that the subject has been raised, possibly M. Casimir-Perier may wish to add his moustache to the long-suffering work of art.

The Boundary-street building scheme of the London County Council is about to enter on its second stage. The architect has got out the foundation plans for the second of the five sections into which the work is divided, and these having been approved by the Committee for the Housing of the Working Classes, the work will be immediately proceeded with. This second section is much larger than the first. It extends right across the extensive space cleared, and some of the new houses upon it will come quite out to the Shoreditch front. This portion of the work will be designed to accommodate somewhere about fifteen hundred people, and the total expenditure upon it will be from sixty to seventy thousand pounds. Excavations will be commenced at once, and it is estimated that about a thousand pounds will be saved by throwing the earth into the central garden space and piling it up in terraces, instead of having it carted away to a distance. There will be two or three broad walks rising one above the other, and connected by steps, the slopes between them being turfed and embellished by flower beds and shrubs, and the whole will be surmounted by a band-stand.

I often wonder, as I roam through the wildernesses of exhibits at the Bloomsbury and South Kensington Museums, what percentage of the articles in the showcases are correctly labelled? A suggestive statement is going the rounds of the provincial press with reference to the collection of "Roman antiquities" recently formed by the city corporation of Carlisle at the Queen Anne mansion, known as Tullie House. It seems that Professor Boyd Dawkins recently visited Tullie House, and examined the extensive collection of "Roman" remains, some of which turned out to be Celtic. As they had been dug up in various parts of the city, they furnish conclusive evidence that Carlisle was a Celtic settlement prior to the time of the Roman occupation. One of the specimens, which had been broken when dug up, enabled Professor Dawkins to discover the process by which the Celts did their enamelling—namely, by fusion, and not inlaying—a fact not previously known.

CHIPS.

A new altar, the work of Messrs. Harry Hems and Sons, of Exeter, has been erected in Christ Church, Frome.

On Tuesday week the foundation-stone of new Church schools for Wetherby was laid by Colonel Gunter, M.P. The schools, designed by Mr. A. A. Gibson, architect, Harrogate, will cost £1,300, exclusive of land, and will accommodate 412 children. The work is being executed by Mr. G. B. Thain, contractor, Wetherby.

The cottage almshouses which have just been erected at Burnhead, near Liberton, N.B., under the will of the late Mr. Thomas Lockerby, Addiscombe, Surrey, were opened on Friday. The cottages are twelve in number, and disposed in pairs, having the appearance of double villas, with plots of ground in front and in rear. Consisting of three rooms and kitchen, with baths, hot and cold water, and every modern convenience, each cottage has cost about £450, giving a total outlay of from £5,000 to £6,000. They have been built to the designs of Messrs. M'Whannel and Rogerson, architects, Glasgow.

The work of drainage in the town of Wetherby has been completed this week. The undertaking has been carried out from plans by, and under the supervision of, Mr. A. E. Preston, C.E., of Bradford.

The town council of Bury, Lancs, have adopted a resolution giving preference to those firms in its contracts who pay the standard rate of wages obtaining in the town or district.

The parish church at Empingham, near Stamford, is undergoing restoration. The entire roofing of oak and lead has been renewed. During the process of cleaning the walls some interesting pieces of ancient mural painting have been disclosed, and these are being preserved. Amongst other things, the tower and spire have been restored. The work is being carried out by Messrs. E. Roberts and Son, of Weedon, and Mr. Traylen, of Stamford, is the architect. Over £2,500 will be expended on the work.

The foundation-stone of a mission church was laid at Pant, near Dowlais, by the Bishop of Llandaff on the 4th inst. The architect of the church is Mr. E. M. Bruce Vaughan, of Cardiff, and Mr. E. Lumley, of Merthyr Tydfil, is the builder.

After undergoing restoration, the church of St. Michael Paternoster Royal, College-hill, Cannon-street, was reopened on Sunday. The church has been enriched by a good deal of the carved work which formerly adorned the now dismantled church of Allhallows the Great, Thames-street. The stone figures of Moses and Aaron, from the latter church, have been placed in the entrance lobby of St. Michael's; and the new organ is inclosed in the fine organ case from Allhallows.

OBITUARY.

We regret to announce the death, in his 71st year, of Mr. Robert Jewell Withers, architect, late of 11, Adam-street, Adelphi, W.C., and formerly of Doughty-street. Mr. Withers, who died at his residence in Schubert-road, Putney, after a short but painful illness from cancer on Sunday last, was a pupil of the late T. Hellyer, of Ryde, and enjoyed at one time a large ecclesiastical practice, his work being excellent of its class. He must have built and restored nearly a hundred churches in the United Kingdom, a notable one being St. James's, Great Grimsby (illustrated by us by four full-page drawings on March 25, 1875), besides the English churches at Brussels and Wildbad. A large proportion of his church restoration practice was in South Wales, where he imparted to many a barn-like structure some semblance of artistic life and feeling. He also carried out numerous parsonages and schools, and many warehouses and business premises. Although he had relinquished his office in Adam-street for some time, he continued in work at his residence in Putney until June last. He was for a long period a Fellow of the Institute of British Architects, but retired from that body several years since. Mr. Withers was a widower, and leaves two daughters and several sons, one of whom is in practice at Shrewsbury.

We also have to record the death of Mr. Charles Herbert Cooper, A.R.I.B.A., of 7, Great College-street, Westminster, at the early age of 32 years. He was the second son of Mr. W. G. Cooper, of Avonmore-road, West Kensington, and died on Sunday last. He became an Associate of the Institute of Architects, after passing the compulsory examination, in 1889.

Mr. Thomas Seir Cummings, who died at Hackensack, State of New Jersey, U.S.A., on Sept. 24, had been, for a period of nearly 70 years, indentified with the practice and the teaching of painting in America; and to whom is due much of the credit for the high standard of work now produced in the schools connected with the National Academy in New York. Born in England in 1804, he was taken to America in the following year. Developing marked ability in drawing, he was placed in the school of the American Academy of Fine Arts. At the age of 21, becoming convinced that students did not receive proper attention, he called a meeting of students, and as a result of that meeting, on Nov. 8, 1825, the present National Academy of the Art of Design was founded. He served for five years as treasurer of the Academy, later became vice-president, and, as chairman of the building committee, had charge of the construction of the new building, which cost £50,000; he also acted as instructor in the Academy schools, and was one of the founders of both the Sketch and Century Art Clubs. He made a speciality of miniature portrait painting; but the advent of photography led to his abandonment of portrait work, and he devoted all his time thenceforward to teaching, succeeding Prof. Morse as Professor of the Art of Design in the University of the City of New York.

The death is announced, at his residence, Summerseat, near Philadelphia, of Mr. John Humfrey Osborne, who has been a prominent civil engineer in the United States for over half a century. He was born in Dublin in 1818, and went to the United States in 1839, and became confidential secretary to Mr. Wirt Robinson, chief engineer of the Philadelphia and Reading Railroad. He rose to be chief assistant in 1843, and in 1846 he was appointed chief engineer of the Philadelphia and Reading Railroad, but resigned that position later on, to join, with his brother, Mr. R. B. Osborne, in the construction of the Waterford and Limerick Railway. Returning to the United States in 1850, he was appointed to the Ogdensburg and Lake Champlain Railway, and the next year took charge of a portion of the construction of the Southside Railway in Virginia. From that time until 1873 he was engaged upon many important railway enterprises in the States. For the past twenty years he practically lived in retirement at his country place, Summerseat.

The Duke of Westminster will lay the corner stone of the great schoolroom of St. Oswald's College, Ellesmere, on Thursday in next week, the 18th inst. The college is one of the group of church public schools founded by the late Canon Woodard, and carried out in sections as funds permit, from plans by the late Mr. R. Herbert Carpenter and Mr. B. Ingelow.

Building Intelligence.

Bournemouth.—Work has been commenced by the contractors, Messrs. George and Harding, of Bournemouth, on the site of the new head post-office, between the Albert and Beckford-roads, the contract being for about £8,500. The office will have a frontage to the Beckford-road of about 70ft., and a depth of 107ft. back to within a few yards of Albert-road. The breadth at the widest part will be 74ft., and the height from basement to roof 62ft. The building will be of brick and stone, with Bath stone dressings, and a slate roof. The public office, to be entered from the Beckford-road, will be 30ft. by 43ft., and the sorting office 40ft. by 67ft. The building is to be completed by the end of February, 1896. Mr. Edward George Rivers is the architect, and Mr. Elliott will be clerk of the works.

Dewsbury.—The board of guardians are at present building a new workhouse infirmary, which, when completed, will cost £20,000. The building is to the south of the present workhouse of Heald-road. The plans, which have been prepared by Messrs. Holtom and Fox, of Dewsbury, show a building of Delph stone, the walls having a thickness of 21in. In the centre is the administrative block, which provides on the ground floor the resident doctor's private sitting-room, the dispensary, and nurses' sitting-room. Beyond these, on each side corridors lead to male and female waiting-rooms. The building will be warmed with stoves provided with down-draughts, also by hot-water pipes on the low-pressure system. Messrs. Shorland Brothers, of Manchester, supply the flues.—The Dewsbury guardians are providing a series of cottage homes on a site outside the workhouse grounds at Staincliffe, and separated from them by Healds-road. The first four cottages now being erected will accommodate 48 boys and girls. Each home will cost about £650. They will be built of Delph stone, with cavity walls, and the whole of the ground flooring will be laid with wood blocks.

Dowlais.—St. John's parish church, Dowlais, has been pulled down, rebuilt, and enlarged, and the new building, which has accommodation for 800 worshippers, was consecrated on Thursday in last week by the Bishop of Llandaff. The new church was built by Mr. W. Dowland, contractor, Abergavenny, from plans by Mr. E. A. Johnson, M.S.A., Abergavenny. Externally, the work has been designed in character with the existing church, which is of Early English type, and the walls are of Llancaiach stone, relieved by Forest and Bath stone dressings. Internally, the new portion of the nave and aisle are lined with buff pressed bricks, pointed in red cement, and the joinery, including the roof, which is of open-timbered construction, together with the seating, is of selected pitch-pine. The old nave, now replaced, had a flat plaster ceiling, overhanging back gallery, and remarkable traceried windows of heavy cast-iron, the expansion and contraction of which had much distorted the arches and walls within which they were built. The tile flooring is by Messrs. Godwin and Sons, of Hereford.

Edinburgh.—Some important decoration has just been executed at the Catholic Apostolic Church, London-street, Edinburgh, by Mrs. Traquair, who painted the interior of the Cathedral Song School of St. Mary's Cathedral in the same city. The great bare wall spaces in the Catholic Apostolic Church were left purposely to be painted when the church was built, nearly 20 years ago, by Dr. Rowand Anderson. The church is Early Norman in style, and between the nave and chancel there is a deeply-moulded arch, rising to a height of 66ft. On each side of it and over it—the roof being 77ft. in height—is a wall area, which represents in extent a canvas equal to about 120ft. by 9ft., and it is this space that Mrs. Traquair has decorated. The design is illustrative of the Worship of Heaven, as that is revealed in type and symbol in the Book of the Revelation, and the style of treatment is Early Florentine. The colours are oil, but worked in the water-colour method. Mrs. Traquair is now preparing to continue the work of decorating the church by illuminating the walls of the chapel and north transept. After these are finished she means to treat the large oblong panels of the nave. In connection with the mural paintings on the great arch, the roof of the chancel has been decorated by Mr. Andrew Hutton, Dundas-street, Edinburgh.

Gateshead.—The Bishop Lightfoot Memorial Church of St. Aidan, at the corner of Askew-road and Bach-street, near Redheugh Bridge, Gateshead, was consecrated by the Bishop of Durham on Saturday. It is constructed of stone, is carried out in a simple phase of Early English, and is seated for 500 persons. Owing to the rapid fall of the site, Sunday-school accommodation for 400 children is provided under the church. The special gifts include an east window, executed by Messrs. Heaton, Butler, and Bayne, of London; a carved oak pulpit, the work of Mr. Hedley, of Newcastle; credence table, litany desk, oak screens for the side chapel, and a marble font. Mr. Stephen Piper, M.S.A., of Westgate-road, Newcastle-on-Tyne, was the architect, and Messrs. Haswell and Waugh, of Gateshead, were the contractors. The outlay has been about £5,000.

Hatcham, S.E.—The Church of St. Catherine, Hatcham, was consecrated on Wednesday by the Bishop of Rochester. It is cruciform in plan and design, to seat between 800 and 900 worshippers. A tower and spire, not yet completed, will stand at the north-east angle of the structure. A vicarage house, erected with the church, stands on its southern side in Pepys-road. The buildings were designed and carried out by Mr. Henry Stock, the architect of the Haberdashers' Company, by whom they have been erected, the contractors being Messrs. Higgs and Hill, of South Lambeth. The total cost of the whole, including fittings and boundary-walls, has been nearly £16,000.

Leeds.—The Duke and Duchess of York visited Leeds on Thursday last week to open the new School of Medicine, erected at a cost of £40,000, in connection with the Yorkshire College, and also to inaugurate the new central hall and library, which have been added to the college at a cost of £20,000. The School of Medicine has been built from plans by Mr. William H. Thorp, F.R.I.B.A., of Leeds, who adopted a Tudor treatment of collegiate work. The building adjoins the General Infirmary on Mount Pleasant, and gives accommodation for 408 students. One of the principal departments is the library, which is 72ft. 6in. by 35ft. 4in., and is fitted in oak. The walls are of brickwork, Morley Moor stone being used for the dressings. All the carved work, both in wood and stone, was executed by the late Mr. J. W. Appleyard, of Leeds. The contract for the general structural work has been carried out by Messrs. W. Wilson and Sons, of Headingley, Leeds, who have also carried out the contracts for drainage.—The Yorkshire College Hall has been carried out from the designs of Messrs. Alfred Waterhouse and Sons, under the supervision of Mr. William Bruce, clerk of works. The chief contracts have been executed as follows:—Mason and brickwork, Messrs. John Wood and Son; carpenter and joiner work, Messrs. John Hall Thorp and Son; plumbing, Mr. George Thompson; structural steel work, Messrs. A. Handyside and Co., of Derby; faïence work, the Burmantofts Company; and mosaic paving, Mr. Ebner.

Lewisham.—A new workhouse infirmary in High-street, Lewisham, was opened on Wednesday. The buildings are designed to accommodate 372 patients, and are divided into four groups, a corridor connecting the wards and administrative section. They include a medical superintendent's residence and a porter's lodge. The patients' blocks are of three stories, each containing two wards for 28 beds and smaller wards for six beds. Each ward has its own bath-room and sanitary appointments, and each pavilion has a central staircase and hydraulic lift, and at the end of each large ward is an external recessed iron staircase for use as a means of escape in case of fire. The wards are warmed with air-chambered stoves, with which are combined batteries of hot-water pipes. The land consisting of 5½ acres, cost, after law expenses and compensation, £5,400, the building cost £57,000, and engineering and other matters, £9,600, or a total cost of £72,000. Messrs. A. and C. Harston, of Leadenhall-street, were the architects, and Messrs. W. Johnson and Co., of Wandsworth, erected the main building.

Lincoln.—During the last week the two lancet windows in the Chapter House, facing the door of entrance, have been filled with stained glass by Messrs. Clayton and Bell, as a memorial to the late Bishop Trollope, to whom the inception of the plan for thus decorating the Chapter House is due, and by whom the scheme of subjects representing the chief events in the history of the cathedral was drawn up. A third window, the gift of an old choir-boy, is also in preparation. A clock is being constructed for the interior of the building, and the 14th-century clock-case is being reconstructed. This case was erected by Treasurer Welbourne, who died in 1380, to whom the cathedral was also indebted for the exquisite stalls of the choir, the vaulting of the three towers, and the dull, uniform row of statues of kings over the west doorway. Welbourne's clock and canopy were in existence about 1730, when the brothers Buck were engaged on their topographical drawings. A sketch of it is contained in the Gough collections at the Bodleian, showing three quarter jacks or figures of men, one at the top to strike the hours, and two at the sides the quarters. One of these wooden figures is still preserved in the chapter library. The canopy was lost to the cathedral when the late Archdeacon Bayley was sub-dean, 1805-1828. He had a fancy for decorating his church at Messingham with objects filched from other churches. The clock-case was carried off by him to form a canopy over the pulpit. This inappropriate place it occupied until a recent restoration of that church, when the late Bishop Trollope made it a stipulation on sending a donation that the canopy should be restored to the minster. To this the vicar assented, and it now takes its old place over the dean's door in the north transept.

Maidstone.—The new technical science and art schools at Maidstone will be opened by the Duke of Cambridge on Tuesday next. The buildings, which adjoin the Museum, have been erected at a cost of £11,000, from plans by Mr. Albert W. Smith, F.R.I.B.A., Maidstone, whose design was illustrated by a double-page perspective elevation, plan, and details in the Building News for Nov. 3, 1893. Messrs. Wallis and Sons, also of Maidstone, have been the contractors. Only the first portion of the whole scheme has been carried out. On Feb. 23, 1877, and Jan. 11, 1878, we published illustrations of additions made to the Museum from plans by Mr. Hubert Bensted, of Maidstone, and on Aug. 13, 1886, we gave two views from photographs of the buildings as then enlarged.

Merthyr.—The new Roman Catholic church at Merthyr at the south-west corner of Pennydarren Park, was opened on Thursday week by the Right Rev. J. C. Hedley, Bishop of Newport and Menevia. The church has been built from the plans of Mr. Joseph L. Hansom, F.R.I.B.A., London, by Mr. Thomas Rees, contractor, Merthyr Vale. The walling is of Pwllypant stone relieved by Box Ground Bath stone dressings. The interior facings are of Corsham Down Bath stone, as also are the pillars and all the inside stonework and arches. The interior consists of a nave, north and south aisles, and north and south transepts. The extensions, to be made later on, will include two side chapels, two sacristies, an organ loft, and side chapels and confessionals off the south aisle. The style is Early English. The roof, which is of pine, is open-timbered, formed of pointed principals, with collar beams. To provide for the future arrangements three arches have been erected at the eastern end for the sanctuary and side chapels. The total length of the nave is 84ft., which will eventually be extended to 120ft. The height from floor to ridge of roof is 56ft.

Newcastle-on-Tyne.—The south-east and south-west wings of the Durham College of Science were inaugurated on Tuesday. The College of Science, which was incorporated in 1871, represents in Newcastle the faculties of science and engineering in the University of Durham, and its students obtain the science degrees and engineering diplomas of the parent University. A new site was secured at Barns Bridge in 1886, and here the buildings were being erected in sections, from designs by the late Mr. Robert J. Johnson, F.S.A., of Newcastle, the style being a rich phase of English Jacobean. The plans, which have since been carried out by Mr. Frank W. Rich, of Newcastle-on-Tyne, show a quadrilateral range of buildings, the four wings inclosing a courtyard. The north-east wing was begun first, the foundation-stone being laid in 1887, and the buildings, which cost £23,000, were inaugurated on November 5, 1888. This wing includes the chemical and physical lecture-rooms and laboratories, museums, and preparation rooms, and in it the whole work of the college has since been carried on. The council then proceeded to the erection of the wings at the south-west and south-east. These include the whole of the apartments to be devoted to the study of engineering and the fine arts, a gateway forming the entrance to the quadrangle; this tower is of brick, with groined stone vault, and has four angle turrets, each rising to a height of 96ft. The chief room is the George Stephenson Engineering Laboratory, 123ft. by 35ft., supplemented by an annexe 9ft. wide for the greater part of its length. Above, is a drawing office and mechanical museum, and over that a studio, both being also 123ft. by 35ft. 6in. The portion of the college yet to be built is the main wing, which is to include the administrative, literature, and agriculture departments. A sum of about £90,000 is needed to complete the buildings, which were illustrated in their entirety in our issue of Aug. 12, 1892.

Old Swan, Liverpool.—A hospital for infectious diseases that has been built at Mill-lane, Old Swan, at the instance of the members of the West Derby and Wavertree Joint Hospital Committee, was formally opened on Saturday. There are six blocks of buildings, consisting of a porter's lodge, an administration block, bath, and dressing block, laundry, one pavilion for eight beds, and two pavilions for 12 beds each, or 32 beds in all. The buildings leave room for the erection of three more pavilions, two for 12 beds, and one for 10 beds, making the accommodation of the complete hospital 66 beds. The site is inclosed by a wall 7ft. high, the only entrance being through a gate in Mill-lane, controlled by the porter's lodge. The administration block has on the ground floor a matron's sitting-room, visitors' waiting-room, a doctors' room, a dispensary, a committee room, and kitchen. Bedrooms, linen stores, bathroom, &c., occupy the first floor. The pavilion next the entrance is for doubtful cases, and contains on either side two single-bed wards and one two-bed ward, duty-room and bath-room between. The remaining two pavilions are alike, each containing two wards of six beds, with duty-room and bathroom between. Both these pavilions are carried upon open arches, the ground underneath the wards being excavated and covered with cement concrete. The laundry block consists of a general washhouse, and separate washhouse for the staff, and also a general laundry and drying stove, fitted up by Messrs. Bradford and Co. There is also a mortuary. The buildings are of common bricks, relieved with Ruabon red bricks. All the interior woodwork is in pitch-pine. The sole contract was taken by Mr. Samuel Webster, of Bootle, and the architects were Messrs. C. O. Ellison and Son, Sir Thomas-street, Liverpool.

Plymouth.—The muniment-room in the Guildhall, on the north side of the Municipal Offices, has recently been fitted, furnished, and decorated under the direction of Messrs. Hine and Odgers, the architects of the group of buildings. It is a vaulted chamber, the vault springing from a central granite pillar. Wainscot cases have been placed around the walls on three sides, and the north wall has been lined with wainscot panelling. Around the column a reading-table of granite, octagonal in form and of quaint design, has been constructed. The wall and roof decoration, by Messrs. Fouracre and Son, of Plymouth, is in harmony with the municipal buildings. That of the roof is composed of diapered ornament of heraldic character, in which the old Plymouth castles with the town motto, interspersed with beacon lights and Royal crowns, are conspicuous, on a ground of maize. Below the springing of the vaulting, and just above the cornice of the oak cases, there runs a frieze, in which occur foliated work, lions, the St. Andrew's cross, the names of the town wards, and the old arms of Sutton, showing a ship in full sail with the beacons at the masthead. Several Shakespearian quotations have been painted in black letter upon the cove of the cornice around the cases, and over the door is an extract, also in black letter, from the poetry of Drayton (1644). The room has a mantelpiece of Plymouth marble, made by Messrs. J. and E. Goad, of Plymouth, and will have Glastonbury chairs at the table and Indian matting and rugs on the floor. The windows have been filled by Messrs. Fouracre with glass of Early English character, having lions rampant in the lancet heads. Messrs. R. A. Lethbridge and Son, contractors, Plymouth, executed all the wainscot work.

Poplar.—The new public library in the High-street was formally opened on Wednesday in last week. The public entrance is through a vaulted hall 11ft. 6in. wide, and the office is reached from this outer hall. The inner hall gives access to the lending-library, which was placed nearest of all the public rooms to the street. Behind the counter are the book stores, which will afford, when completed, space sufficient for 35,000 to 40,000 volumes. The news-room, for 120 readers, is entered from the south end of the inner hall. The height of the central portion of the room being 21ft. 6in., and that of the sides 11ft., there is equally-distributed lighting throughout from windows in clerestories, and there are also windows at a low level. Top-lighting has been intentionally avoided throughout the buildings. The reference-room, entered through the news-room, will seat 120. The books will be given out, and counsel given, at a flap in the inclosure forming the sub-librarian's office. From this office also complete command is had of the rooms. Messrs. Cormick and Sons, of Canonbury, were the contractors; the heating, by hot water at low pressure, was done by Messrs. Strode and Co.; the gas-lighting is by Wenham ventilating lamps, the vitiated air being carried up in iron tubes to vents placed in the tops of the roofs. Mr. H. G. Rogers was the clerk of works. The upper book store and the large hall in the next side have not yet been carried out. This hall was planned to seat about 220 persons for lectures, being capable of subdivision, when required, into two smaller rooms, suitable for educational classes. Messrs. Clarkson, of Great Ormond-street, were the architects to the Commissioners. We illustrated their design in our issue of Oct. 14, 1892.

Stamford.—Progress is being made with the erection of the school for technical education at Stamford. The total cost will be about £1,150 exclusive of fittings, and the work is being carried out by Mr. John Woolston, builder, of Stamford, the architect being Mr. Traylen, of Broad-street, Stamford. The site is a part of the shambles in Broad-street, and it extends back a distance of 70ft. from the street, affording space not only for the present buildings, but also for carpenters' and other workshops which may be erected subsequently. The new building is approached by an entrance hall 6ft. wide, leading into two class-rooms, each 21ft. by 20ft., on the ground floor. Upstairs the whole frontage is occupied by one room, 50ft. by 20ft., divided by a movable partition. This room is lighted by seven large windows to the front, securing a north light. At the half-landing is a store-room for books and drawings. The heating will be by warm air. The ventilation has been intrusted to Messrs. Robert Boyle and Sons, of London. Outhouses are provided for coals, stores, &c. The front elevation, facing Broad-street, is, both in design and in material, in keeping with the architecture of Stamford in the Georgian period. The school throughout is being built of selected Stamford stone, with Collyweston slating.

* * *

After a long and warm discussion, the town council of Sutton Coldfield decided to increase the salary of the borough surveyor to £325 for the year ending March, 1896, with an increase of £25 next year, being in all £150 more than his present salary; the surveyor not to be allowed any commission, or to take any private work in the future, but to devote the whole of his time to the business of the corporation.

The Bishop of Peterborough has accepted an invitation from Mr. Woolrych Perowne to lecture to the members of his educational tours to Rome and Palestine next spring. The subject of the lectures will be "Rome of the Renaissance" and "The Influence of the Popes on Roman Architecture." Lectures will also be given by Mr. Oscar Browning, Canon Evans, and Professor Lanciani in Rome, and Mr. Bliss and other archæologists in Palestine.

An international exhibition, illustrating hotel arrangements and accommodation for travellers, as well as means of transport by sea and land, will be opened in Amsterdam in the summer of next year. The buildings are to be erected on the land situated at the back of the State Museum on the site occupied by the Universal Exhibition of 1883, and will cover a superficial area of 175,000sq.yd. The funds, both for carrying out and guaranteeing the undertaking, have already been provided, the plans of the various exhibition buildings are being prepared, and their construction will be shortly taken in hand.

It is interesting to recall that the commencement of the late Sir Rupert Kettle's services as an honorary arbitrator in trade disputes was the settlement of a disastrous strike in the building trade at Wolverhampton in 1864. Mr. Kettle's success in this dispute led to the establishment of a legally-organised system of arbitration.

COMPETITIONS.

Liverpool.—The Liverpool school board held a special meeting on Tuesday to select an architect for the proposed school board offices. Four plans had been received, submitted under the mottoes "Balbus," "As You Like It," "Classic," and "Doonie." A committee had, by five votes to three, recommended the adoption of those under motto "Balbus." This recommendation was, after a discussion, adopted, and on opening the envelope it was found that the successful competitor was Mr. C. E. Deacon, of Central Buildings, North John-street, Liverpool, who has been appointed architect for the building. The other selected competitors were Messrs. George Bradbury, Edmund Kirby, and T. Mellard Reade, all of the same city.

CHIPS.

The partnership hitherto subsisting between H. Bushell and C. Crosier, architects and surveyors, Great James-street, Bedford-row, W.C., has been dissolved.

The town council of Bury, Lancs, have decided, after a long discussion, to empower a committee to obtain plans for the erection of a municipal lodging-house capable of accommodating 300 persons.

Mr. Nowall Parr, assistant borough surveyor of Walsall, has been chosen out of 163 candidates for the post of surveyor to the Brentford local board, at a salary of £250 a year and liberty to act as consulting engineer.

The valuable collection of clocks and watches presented by the Rev. H. L. Nelthropp, M.A., the master, to the Clockmakers' Company is now on view at the Guildhall. The collection traces the history of horology from the Middle Ages.

A stained-glass window, illustrating Christ blessing little children, was unveiled last week in Landkey parish church, North Devon. Mr. F. Drake, of Exeter, designed and carried out the work.

The Manchester, Sheffield, and Lincolnshire Company have completed their connection with the Welsh railways *viâ* the Hawarden Bridge over the river Dee, and are now rapidly pushing on the Wirral line, which will, *viâ* the Mersey Tunnel, give the railways of the Principality direct communication with Liverpool. Only a short section of line from Wrexham to Ellesmere—now in course of construction—is required to complete this combination.

After a long discussion and several divisions, the town council of Rochdale have adopted a fair-wages clause in their agreements with contractors, with the following addition to it:—"That a clause be inserted in all contracts that the contractor shall forward with the original tenders a list of the names of the sub-contractors."

Mrs. Lyne Stephens, of Roehampton, Lynford Hall, and Paris, who died recently, has bequeathed three pictures to the National Gallery, and some old furniture and china to South Kensington Museum.

A water-colour drawing of Tintern Abbey, by Mr. T. Hunn, has been presented to the Guildhall Art Gallery by Mr. Edward Lee, C.C. Another recent presentation to this collection is a small oil painting, entitled "The Rivals," by Robert Smirke, R.A., the gift of Colonel J. L. Rutley.

Mr. Thos. Codrington, M.Inst.C.E., held an inquiry at the town-hall, Whitchurch, Salop, on Wednesday week, the Whitchurch and Dodington Local Board having applied to the Local Government Board for sanction to borrow £1,150 for sewerage works; £400 for the purchase of a steam roller; £300 for works of water supply, and £150 for market purposes.

At the last meeting of the Glasgow town council a memorial was read from the Glasgow Architectural Association with reference to the proposed removal of the Tron steeple. The association considered that the destruction of the steeple would be an irretrievable loss, both from an architectural and a historical point of view, and that the setting of it back to the frontage of the adjoining buildings would hopelessly ruin its effect. The memorial was sent to the committee having charge of the question.

The members of the Engineers' and Architects' Association of South Africa, at their last meeting, held at Johannesberg on the 12th ult., discussed the nature and strength of timbers in general use for building and engineering purposes. Mr. C. Alburrow, the president, occupied the chair, and the discussion was opened by Mr. A. H. Reid, who referred to the increasing commercial demand for Cape boxwood in Europe for engineers' purposes, and for stinkwood for pianos. Messrs. Tarlton, J. S. Curtis, A. N. Francis, and others took part in the discussion.

ARCHÆOLOGICAL.

Archæological Congress at Seraievo.—Mr. Robert Munro, of Edinburgh, the only British representative present at an international congress of archæologists held at Seraievo, the capital of Bosnia, from the 15th to the 21st of August last, has communicated to the daily press a report of the proceedings. The proceedings commenced with an inspection of the Museum, founded only six years ago, and which contains the prehistoric remains from Glasinao and Sobunar, many Roman antiquities, monuments of the Early Christians and the Middle Ages, a collection of costumes and anthropological specimens. Special attention was directed to a group of antiquities of the Stone Age, consisting of an immense quantity and variety of fragments of pottery, flint, and other stone implements and weapons, &c., arranged by Herr Radimsky in one of the ground floors of the museum, and afterwards the locality was visited where these remarkable objects had been found. The excavations are being still conducted by Radimsky, in a raised area known as Butmir, in the vicinity of the plain of Ilidze. All this raised area is composed of the débris of early human occupancy. Part of this prehistoric settlement is presently occupied by a large dairy and other buildings, but the rest is simply arable land and can be readily excavated. The relics have been found scattered throughout the débris, at all depths from 6ft. or 10ft. or so. On the opposite bank of the Bosna, at the still fashionable spa at Ilidze, numerous foundations of houses, mosaic pavements, baths, water conduits, and the usual industrial remains of Roman civilisation, have recently been found. Some of the mosaic pavements are preserved *in situ*, but many of the smaller objects have been removed to the museum at Seraievo. Another excursion was made to the prehistoric huts at Sobunar, where much pottery and many bronze and bone implements and ornaments have been found. A two days' visit was made to Podomanja, where some tumuli and hill forts were examined, and to the prehistoric cemetery at Rusanovic, where Herr Fiala is carrying out excavations. Mr. Munro adds that since the museum was established by the Austro-Hungarian Government in 1888 there has been accumulated throughout Bosnia and Herzegovina a mass of scientific materials unsurpassed, in a corresponding period of time, by any other country in Europe.

◆

At the last meeting of the Southampton town council, Mr. James Lemon, F.R.I.B.A., brought up the report of the boundaries committee, in which they recommend that the boundaries of the Parliamentary and municipal borough should be made conterminous. This would involve the inclusion in the area under the corporation of Shirley and Freemantle, Woolston, Bitterne, Hound, and Milbrook, adding a total acreage of 6,032, and a population of 28,446. Consideration of the report was adjourned for a week.

Ospringe Church, Kent, has received an addition to its interior decoration at the east end of the sanctuary by the insertion of mosaic panels high up the east wall, as a memorial to the late vicar, Canon Griffin. A handsome pulpit and clergy stall have been provided, the latter in carved oak. The pulpit is in Caen stone, octagonal in shape, with richly-carved panels and tracery, and clustered and single shaftings of carefully selected and rare marble and alabaster. The work has been carried out by Messrs. Jones and Willis, of London, under the direction of the architect to the church, Mr. Philip Day, of John-street, Adelphi.

The new room just added to the art gallery at Oldham was inaugurated on Monday with an exhibition of 19th-century pictures. The gallery measures 97ft. by 32ft., and is fitted up with the electric light. The loan pictures include fourteen examples of the works of Sir J. Millais, S. F. Watts's "Love and Death," "Diana and Endymion," and half a dozen portraits; while Sir E. Burne Jones, Sir F. Leighton, Holman Hunt, P. Calderon, Sir J. D. Linton, Sidney Cooper, J. Macwhirter, the late Albert Moore, Vicat Cole, and F. Madox Brown are well represented.

The town council of Salford have just built a model lodging-house for men in Bloom-street, on a site containing an area of 1,410sq.yd. The scheme is based on the plans recently adopted by the London County Council, and the buildings consist of two blocks, each five stories in height, carried out in brick with terracotta dressings. The central hall is 30ft. by 36ft., the dining-room 71ft. by 31ft. and 14ft. high, and the dining-room 48ft. by 31ft. Sleeping accommodation has been provided for 285 lodgers at a total cost for land, building, and furniture, of £15,000.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Liverpool Architectural Society.—The first meeting for the present session of this society was held on Monday in the Law Library, Union-court. Mr. Henry Hartley, F.R.I.B.A. (president), occupied the chair, and in his opening address referred with regret to the death of Mr. Josep Boult, one of the oldest members of the society, and afterwards congratulated the gathering upon the establishment of a new school of architecture in connection with the University College. In conclusion he introduced Professor F. M. Simpson, who has recently been appointed to the chair of architecture at the university. Professor Simpson gave an idea of the syllabus of the meetings, lectures, &c., he intended arranging during the coming session. The matter was discussed by the members, and at the close a vote of thanks was passed to the president, on the motion of Mr. G. E. Grayson, seconded by Mr. Edmund Kirby.

CHIPS.

The local board of Stone, Staffs, are about to carry out works of sewerage. Mr. Whitfield has taken the contract at £1,648, and Mr. F. Bradshaw, of Salford, is the clerk of works.

The local board of Wallasey have accepted the gift of fifty acres of the sandhills near the mouth of the Mersey as a public park and recreation ground for the district.

The local board of Skipton are about to purchase the town-hall in that district, the price being £4,500.

On Saturday the Bishop of Durham consecrated the extension of the Gateshead Cemetery. The cemetery was opened in August, 1862, and has now been enlarged from 28 to 41 acres.

At the last meeting of the committee of the Aberdeen Art Gallery, gifts to the institution of busts of Scott and Burns were intimated from Mr. D. W. Stevenson, of Dean Studio; and of the civic badge and chain of office belonging to the Provosts of Old Aberdeen, from ex-Provost Sinclair.

The east window of Northallerton parish church is about to be fitted with stained glass as a memorial of the late vicar, through whose exertions the chancel was rebuilt, the body of the church restored, and a new organ provided. The subject of the window, which has been designed by Mr. C. Hodgson Fowler, F.S.A., of Durham, the architect for the restoration, is our Lord in glory surrounded by adoring saints, the dedication of the church being to All Saints.

On Saturday, the memorial stones of a new Miners' Hall were laid at Ashington Colliery, Northumberland. The new hall—the first of the kind in the county—is being built from designs by Messrs. Boolds and Hardy, of Morpeth, by Mr. Spence, of Amble. It will have sitting accommodation for 1,660 persons.

The Corporation of Rochdale have accepted the gift of a fossil tree, found in the coal measures at Sparth Bottoms; the trunk is 7ft. in length, and has long stigmarian roots attached.

The Mayor and Corporation of Aberystwyth have inaugurated the installation of the electric lighting of the marine front and main portion of the town by a banquet. The marine esplanade is lighted by arc lights of 2,000c.p., placed 45 yards apart, and similar lamps are placed in the main thoroughfares.

The erection of the intermediate school for Newport, Mon., has just been commenced. Mr. E. Lingen Barber, of Hereford, is the architect, and Messrs. Thomas and Co., of Swansea, have taken the contract for erection at about £5,200.

It was lately contemplated to lower the lofty spire of Square Congregational Church, Halifax, there being some suspicion of instability. A thorough professional examination was made, however, by Mr. Williams, architect, of the firm of Messrs. Horsfall and Williams, and Mr. George Charnock, with the result that it has been found sufficient to build up on the inside one of the spaces, 9ft. across, left for the clock on the eastern face of the tower. This has been done, some 12 or 14 tons of stone being used. The pinnacles are being dowelled with copper, and the completion of this work will make the spire safe, and thus preserve a conspicuous landmark to Halifax.

In addition to the awards already published, Messrs. Harry Hems and Sons, ecclesiastical art works, Exeter, were among the British exhibitors who received a gold medal at the Antwerp Exhibition. The same firm was also awarded a silver medal.

The members of the Society of Engineers, headed by Mr. George A. Goodwin, their president, visited, on Tuesday, Messrs. Siemens Brothers and Co.'s works at Charlton.

Correspondence.

ARCHITECTURAL PHOTOGRAPHS.

To the Editor of the Building News.

Sir,—A society for the exchange of photographic prints has long been a dream of mine; but the difficulty has always been to get amateurs to make the prints themselves, as it involves a considerable expenditure of time.

The suggestion, however, you make in this week's issue of the Building News is a happy one, and if a sufficient number join, should prove a success.

I, myself, have some hundreds of negatives of out-of-the-way ecclesiastical and domestic work, and should be glad to exchange prints with amateurs, architects or otherwise, similarly circumstanced.

It is a project that might well commend itself to the A.A. Camera Club, but in the mean time (in default of any amateur, more centrally situated, offering his services) I shall be glad to receive the names of any willing to join such a society, and should take steps to call a preliminary meeting in London at an early date.—I am, &c.

A. Whitford Anderson, A.R.I.B.A.

28, High-street, Watford, Herts, and 2, Broad-street Buildings, E.C. Oct. 8.

Sir,—Your admirable leader in this week's Building News, dealing with architectural photography, has greatly interested me, and doubtless others also.

As an amateur photographer and enthusiastic lay student of Gothic architecture, I for one should welcome the establishment of such a society for the exchange of architectural prints as you suggest in the close of your article, and should be pleased to be placed in communication with anyone interested in such a movement.

The importance of the historical study of building and building design has, as an educational agency and quite outside of its value to the professional student, been much underestimated, and in no way can this study be more effectively assisted than by the aid of photography.

I would suggest that an article on the photographic study of architecture would be much appreciated by the readers of your paper.—I am, &c., Gothic.

Intercommunication.

QUESTIONS.

[11224.]—**F.S.I.**—Can any of our numerous readers inform me if there are any classes in or near Manchester preparing for the F.S.I. exam., and where I could get particulars?—B. S. A.

[11225.]—**Clock Tower.**—The writer is desirous of knowing the locality of a drinking fountain with clock-tower above, in good Gothic style. If any correspondent will be kind enough to give information as to where any such may be seen, it would greatly oblige.—W. M.

[11226.]—**Iron and Steel Girders.**—What is the best method to detect whether girders are built of wrought iron or steel, without cutting same?—W. D. G.

◆

The annual general meeting of the Junior Engineering Society was held on Friday evening at the Westminster Palace Hotel, Mr. P. J. Waldram in the chair. The report of the council showed that during the past session 64 new members had been elected, and that the total number of members was 379. It was resolved, on the motion of Mr. S. Boulding, that in future the name of the Society should be "The Institution of Junior Engineers."

The *Western Daily Press* states that the quarries adjacent to Kingswood, Mangotsfield, Fishponds, Stapleton and neighbourhood are likely ere long to be worked by one board of management. Two schemes have been under consideration. One where a moderate capital only is necessary, and another with a capital of £60,000. So far, the smaller scheme has only been proceeded with. Several quarry masters are stated to be favourable to the scheme.

The North British Railway Company having now carried their tunnel beyond the site of St. Martin's chapel, Castle-terrace, Edinburgh, that building was reopened on Sunday. The chapel, which stands over two tunnels, received a considerable shake from the railway operations, but it has been restored after having been closed for a year. When the first tunnel was constructed the chapel was closed for three years, from September 1845 till October 1848, and even then there was some hesitation as to the safety of reoccupying it.

Legal.

LOCAL BUILDING REGULATIONS.

UNDER this heading a letter signed "Surveyor" appeared in our issue for Sept. 7, 1894 (p. 342), in which undoubtedly the writer drew attention to an important and interesting question. His case was that of a builder who had deposited plans with the local authorities, and was building a house of the value of £2,000 within the rateable area of the local authority. Owing, however, to the fact that the public sewer was about 500 yards away from the house he had had to erect a large cement-lined cesspool, which will have to be emptied by the occupier at an annual expense of some £8. The point pressed by the writer is that, as the occupier will have to pay sewers rate, he will, in fact, be paying this rate for nothing, having himself to bear the sole charge of the removal of the sewage from his premises. It appears that the local authority promises that at some future time the main sewer will be carried past the building in question; but until then matters must remain as they are.

It is difficult to see what can be done at law to alter this state of things. The local authority can, and doubtless do, answer that, if a man chooses to build himself a house so far from the public sewer, he must take the consequences, and either run a drain at his own expense into that sewer, or build a proper cesspool and empty it regularly at his own cost. If there were a row or a street of houses, the matter would be somewhat different, and the local authorities might probably be called upon to extend their scheme of drainage, so as to comply with the needs of these new occupiers and ratepayers; but the erection of one house, however large and costly, does not seem to raise the same issue. The point is one of principle, for if this builder is right, so would other builders be who put up big houses in out-of-the-way places, and then called upon the local authorities to meet them in the drainage at the expense of the ratepayers generally. The argument from the payment of sewers rates is fallacious, for such rates are charged upon all property to maintain the common drainage and sanitation of the whole locality, and they are not paid by each for his own special drainage; but, of course, the builder can submit his case to the Local Government Board, and take the opinion of that department.

FRED. WETHERFIELD, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

LEGAL INTELLIGENCE.

ARBITRATION AWARD AT SOUTHAMPTON WEST.—The arbitration between the executors of the late James Whitchurch and the London and South-Western Railway Company, upon which there was a claim for a piece of land by the executors of the late James Whitchurch for £1,457 10s., and for which the Railway Company officially offered through their valuers the sum of £660, has been settled by the umpire (Mr. Squarey) at £838.

The London County Council on Tuesday considered a recommendation of the Parliamentary Committee that the question of the reintroduction of the Tower Bridge Southern Approach Bill be referred to them and to the Improvement Committee. This led to a long discussion on the betterment question, but an amendment was eventually rejected by 63 to 26 votes, and the recommendation agreed to.

At Darwen, the ceremony of opening a new technical school and free library building, erected at Darwen at a cost of £15,000, was performed on Saturday. The building has been erected from designs by Mr. J. Lane Fox, of Bond-street, Dewsbury, selected in competition, and was illustrated in the BUILDING NEWS for Jan. 10, 1893. It is of stone, and is three stories in height.

The first main line train was run by the directors of the Rhondda and Swansea Bay Railway on Tuesday over the new line from Neath into Swansea. The party included Mr. Yockney, the engineer, and his entire staff; Mr. Lawton, contractor for the Swansea section; and Mr. Palmer, contractor for the Neath Swing Bridge and Briton Ferry sections. With the exception of a short section at Briton Ferry, the whole line from the Rhondda Valley into Swansea is now complete.

WATER SUPPLY AND SANITARY MATTERS.

AMBLE.—The Amble local board of health have finally adopted the Newton and Hazon scheme to supply the town with water at an estimated cost of £6,000. The project consists of conveying the water from a drift near Newton Colliery, and a number of springs at Hazon, into a collecting and subsiding reservoir, and laying nearly seven miles of 6in. and 8in. cast-iron pipes, and constructing an impounding reservoir to hold one million gallons. Mr. M. Temple Wilson, architect and surveyor, Alnwick, has been commissioned to prepare the plans, sections, and details to be transmitted to the Local Government Board.

THE NEW SHEFFIELD AND LONDON RAILWAY.—Mr. E. P. Burd held inquiries at Nottingham and Leicester on Tuesday and Wednesday, on behalf of the Local Government Board, as to the demolition of houses by the Manchester, Sheffield, and Lincolnshire Railway Company in the construction of their line to London. At Nottingham, Sir S. G. Johnson stated that some eight or 10 years ago there arose an exceedingly wild building speculation in that town. Land went up in price, houses were placed upon it, and the town became so overbuilt that there were at one time fully 6,000 empty houses. The line of railway, so far as it passed through the central parts of the town, would involve the destruction of a lot of insanitary property which had been condemned long ago. They had had schemes for dealing with that property; but their past experience in regard to unhealthy areas did not invite them to attack them again. The last scheme they had lost £80,000 over, and until Parliament found some way of dealing with such matters with more despatch, and at less cost to the town, he did not think the Corporation of Nottingham were likely to take further action, excepting when they got the chance of getting a house here and there. Evidence was given at both inquiries to the effect that artisans were going further away to occupy a better class of houses; but a strong feeling was expressed that the company should build dwellings at a rental of 3s. or 4s. per week. A large number of insanitary houses will also be demolished at Leicester.

CHIPS.

The parish church of Otterden was consecrated last week by the Bishop of Dover, after the erection of new chancel, provision of open benches for nave, furniture, fittings, and organ, at a cost of £800.

Several stained-glass windows have recently been placed in Emmanual Church, Mannamead, Plymouth. The east window is from cartoons by Sir Edward Burne Jones, and is the handicraft of Mr. William Morris. A window has just been placed in the north transept, and is from the studio of Fouracre and Son, of the West of England Stained Glass Studio. The figures selected for representation are Hope and Patience.

The contract for the erection of the superstructure of the new Post-office in Victoria-street, Liverpool, has been given to Messrs. Thornton and Son, contractors, Northumberland-street, in that city. It is said that, owing to the stringent nature of the conditions laid down by Government, the number of competing tenders for the work was comparatively few. The amount of Messrs. Thornton and Son's contract is about £112,000. Work will be commenced without delay. We illustrated the Post-office, which is being built from Mr. Henry Tanner's designs in the BUILDING NEWS for Oct. 27, Nov. 24, and Dec. 1, 1893.

The London and India Joint Docks committee have decided to erect on the north side of the West India Dock storage accommodation for 100,000 sheep, together with sidings which will place the stores in direct connection with the general railway system of the country. The railway communication will also be used for grain coming to the dock, and the stores will be constructed on the same principle as those at the Victoria and Albert Docks.

The police commissioners of Motherwell have adopted a report by Mr. Henry A. Mavor, electrical engineer, Glasgow, showing the estimated cost of lighting the streets at £12,500, and calculating that, with the saving effected and the income from private lighting, there will be no increase on the rates.

The ceremony of laying the chief corner stones of the Neath intermediate schools took place on Thursday, the 4th inst. The building will accommodate 120 scholars; Mr. D. M. Jenkins, borough engineer, is the architect, and Messrs. Henry David and Sons are the contractors. The cost is estimated at £3,500.

The promoters of the Manchester, Glasgow, and Newcastle Railway scheme, having received a favourable report from the five engineers who recently traversed the proposed route, and having also obtained a considerable measure of local sympathy and support, have decided to bring forward a Bill in the Parliamentary session of 1896.

Our Office Table.

A SERIES of seven lectures on building and sanitary construction is being delivered on successive Wednesday evenings under the auspices of the Carpenters' Company at their fine hall in London-wall. The lectures are only open to intending candidates for the examinations established by the Company, and are illustrated by take-to-pieces models, large diagrams, photographs, and specimens of materials. The first of the course was given on Wednesday last, when Professor T. Roger Smith dealt with the properties and qualities of bricks, stones, limes, and cements, and also described the methods of making and using mortar, cement, and concrete. Next Wednesday evening Mr. Percival Gordon Smith, the architect to the Local Government Board, will speak on "Building Acts and Bylaws for Controlling the Construction of Buildings adapted to various Localities"—a sufficiently large order for a full evening's discourse. On Oct. 24, Professor Henry Robinson will treat upon "The Drainage of Buildings and the Construction of Sewers"; on the 31st Professor Banister Fletcher, F.R.I.B.A., takes up the topic of "Sanitary Building Construction"; on Nov. 7th Professor A. Wynter Blyth follows with a discourse on "Sanitary Appliances"; on Nov. 14th the "Principles of Calculating Areas and Cubic Space" will be explained by Mr. Henry Law, M.Inst.C.E.; and the course will be closed on Nov. 21st by an address by Mr. J. Wright Clarke on the "Details of Plumbers' Work." The examinations of candidates will take place on Friday and Saturday, December 14th and 15th, when certificates, bearing the seal of the Carpenters' Company, will be granted to all successful candidates, and the three placed highest will receive respectively a gold, silver, and bronze medal.

THE eighteenth voluntary pass examination of candidates for the offices of municipal engineers and surveyors to local boards, carried out by the Incorporated Association of Municipal and County Engineers, was held at the Council-house, Birmingham, on Friday and Saturday, the 5th and 6th October. Eighteen candidates presented themselves for examination, the written portion of which was taken on the first day. The greater portion of the second day was occupied with the *viva voce* portion of the examination. The examiners were: (1) For engineering as applied to municipal work, Edward Pritchard, M.Inst.C.E., of Birmingham and London (past president). (2) Building construction, W. Geo. Laws, M.I.C.E., city engineer, Newcastle-on-Tyne (past president). (3) Sanitary science, Alfred M. Fowler, M.Inst.C.E., of Manchester (president). (4) Public health law, Joseph Lobley, M.Inst.C.E., borough engineer, Hanley (past president). The next examination will be held in London in April, 1895.

THE first of a series of six lectures on "The Empire in Egyptian History" was delivered at University College on Saturday afternoon by Professor Flinders Petrie. The lecturer outlined the whole period of the seventeenth to the twentieth dynasty, about 1600 to 1050 B.C., which is better known than other parts of Egyptian history. It is possible, he said, to trace the exact relationships of the Royal family, and to form a life-history of many of the persons. The inscriptions also are far more extensive than in other times, and show the character and individuality of the various actors. Though the arts were not so splendid in execution as in the rarer examples of earlier times, there was a more diffused skill and science; and the rise of an extensive middle class created a great demand for luxury. The wide foreign conquests of the eighteenth dynasty and the plundering of the Asiatic civilisations brought in new tastes and new ideas, together with a flow of wealth and of labour for executing great works. The greatest power and activity of Egypt was in the glorious reigns of the middle of the eighteenth dynasty. After that decadence began, and the downfall of Egypt came in the twentieth dynasty.

THE excavations being carried on at Epidaurus by the Athenian Archæological Society have brought to light the ancient Stadium or racecourse. The whole space has not yet been cleared away, but in the trenches sunk into its area, at a depth of 4-5 mètres, the rows of marble chairs, each with its inscription, which ran along the whole circuit of the Stadium, have been found *in situ*. This is the first Greek Stadium yet discovered in its original state. Professor Dörpfeld will resume shortly his excavations between Mars Hill and the Pnyx, where last spring he discovered a great aqueduct. The Greek Government has declared the whole of the northern slope of the Acropolis, from the Theseion to the Monument of Lysikrates, "archæological ground," thereby forcing the proprietors to sell at prices to be settled by a mixed commission of sworn experts. The American and German schools and the Archæological Society of Athens will meet jointly the cost of expropriating this district, now covered with small one-story houses.

Mr. Terrell, the United States Minister at Constantinople, has reported to Washington announcing the results of American explorations now being conducted at the ruins of Niffer, near ancient Babylon. The work began in 1886, and, except at occasional intervals, has been actively conducted. Dr. Peters and Prof. Heilpricht, of the University of Pennsylvania, began the work, and it is still continued by Dr. Peters. From 150 to 250 Arabs have been constantly employed. In the number of tablets, bricks, inscribed vases, and in the value of cuneiform texts found, this American enterprise rivals, if it does not excel, in the opinion of Mr. Terrell, the explorations of the late Sir A. H. Layard at Nineveh, and Rassam's excavations at Abu-Hatba. Prof. Heilpricht remains at the museum in Constantinople, at the request of the Turkish Government, translating inscriptions and arranging tablets, bowls, and vases used from 1,000 to 4,000 years before Christ. Many tons of tablets, &c., have already been procured, and the enterprise has, he considers, revealed an antiquity for the human race nearly ten centuries older than had before been acknowledged by Biblical students.

An interesting statement with reference to building operations in Glasgow was made on Friday at the Dean of Guild Court of that city by Sir James King, the retiring Lord Dean. It was, he said, eighteen years since he last passed in review the work of the Dean of Guild Court for the year. That was in the years 1874-75, in which many fortunes were made and lost in building speculations, and there followed a period of depression from which the city even now was just recovering. The total value of the work passed in the years 1874-75 was £1,826,150, while in 1875-76 it rose to £2,125,249. That was followed by a period of severe depression. The greatest increase since then had been during the last two years. In the year ending 31st August, 1893, the total value of the work authorised by the Court was £1,330,680, while in the year ending 31st August, 1894, it was £1,275,445. During the past year the houses erected were:—One room, 470; two rooms, 1,519; three rooms, 874; four rooms, 369; five rooms, 89; six rooms and upwards, 145—total number of houses, 3,466. The number of shops erected was 123, and the total estimated cost of the houses and shops was £785,950; alterations and additions, £241,310; and public buildings and warehouses, £248,185. In addition, 21 new streets had been made. The total number of linings passed was 623—an average of 26 at each Court. The number of new houses erected in 1894 was in excess of any year since 1876.

The Local Government Board have informed the Taunton Town Council that they must not lower the height of the new steel bridge which is in course of erection over the Tone, and that if there is any deviation from the plans, they will not sanction the borrowing of any further loans. It will be remembered that, against the advice of their engineer, Mr. Brereton, the council decided to reduce the gradients of the bridge after a contract had been entered into. Owing to the fact that the work of cutting off the piers in order to lower the bridge has been proceeded with, the council are in a difficulty, as it will be costly to alter the bridge back to the lèvel laid down in the plans.

The Twenty-eighth Annual Convention of the American Institute of Architects will be held in New York on Monday, Tuesday, and Wednesday in next week at the rooms of the Architectural League, in the Fine Arts Society's Building, 215 West 57th-street, New York, closing with a "smoker," an informal reception in the rooms of the Building Trades Club, 117, East 23rd-street. The Convention is regarded as very important in the history of the American Institute, as vital changes in the relations of the chapters to the institute are proposed.

CHIPS.

We regret to see that among the persons injured by the disastrous explosion of powder in the gunsmith's shop at Darlington, on Tuesday, was Mr. G. Gordon Hoskins, J.P., F.R.I.B.A., a member of the town council, who, while standing in an adjoining shop, was badly cut about the head.

A meeting of shareholders of John Noble, Limited, was held at the Warehouse, Manchester, last week, at which dividends of 6 per cent. per annum on the preference, and 8 per cent. on the ordinary, shares were declared, and a balance of £2,272 carried forward.

Additions are being made to Meers Schools, Longton, from the designs of Mr. T. P. Hulse, architect, of that town. Special consideration has been given to the ventilation, which will be carried out on the Boyle system, the latest patented improved form of self-acting air-pump ventilators being adopted for the extraction of vitiated air.

A piece of freehold land 17 acres in extent has been presented to the corporation, West Bromwich, to be laid out as a public park and recreation ground.

The local board of Mumbles have appointed Mr. Bennett as surveyor, at a salary of £130 a-year.

The town council of Bolton have raised the salary of Mr. Smith, the gas engineer, from £600 to £650 a year.

The foundation-stone of new Roman Catholic schools was laid last week in Bugle-street, Southampton. The main building will be 69ft. by 22ft., and 16ft. high to plate. Mr. Leonard Stokes, of Westminster, is the architect.

The ancient cross of Newton-on-Ayr having been unearthed, a committee of the town council are endeavouring to find a suitable site for its re-erection.

Mr. Arnold Mitchell commenced on Tuesday afternoon a course of ten University Extension Lectures on "English Architecture" at Chelsea Town-hall.

MEETINGS FOR THE ENSUING WEEK.

Saturday (To-morrow). — London and Provincial Builders' Foremen's Association. Quarterly Meeting at the Memorial Hall, Farringdon-road. 7.30 p.m.

Wednesday.—Carpenters' Hall. Lecture to Students in Sanitation, by P. Gordon Smith, F.R.I.B.A. 8 p.m.

◆

Mr. Robt. H. Bicknell, C.E., of Lincoln, has issued a supplementary report as to the best means of draining the town of Stamford. He estimates that the cost of putting in the connections with the public streets up to the property or building line will be £4,000, in addition to the estimate already furnished for laying down the drains, &c.

Mrs. Long, widow of Mr. Edwin Long, R.A., has stated her intention of presenting to the City of Bath, her husband's native place, his picture, "The Raising of Jairus's Daughter," which is valued at £5,000. The offer has been accepted by the city, who have expressed their thanks for the gift.

At their last meeting the City Court of Common Council agreed to contribute £500 a year for the next four years towards completing the internal decoration of St. Paul's Cathedral.

The new Infectious Diseases Hospital, Whitehaven, is being warmed by means of Shorland's patent Manchester grates and patent Manchester stoves with descending smoke flues, and ventilated by means of Shorland's patent exhaust roof ventilators and inlet panels, the goods being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

ABINGDON.—For the erection of 24 artisans' dwellings, for the master and governors of Christ's Hospital. Mr. Jno. Geo. T. West, M.S.A., architect. Quantities by the architect:—

Bartlett Bros., Witney	£5,700	0	0
Bell and Son, Saffron Walden	5,692	0	0
Bottrill and Son, Reading	5,597	0	0
Silver and Son, Maidenhead	5,497	0	0
Goodchild, Reading	5,425	0	0
Parnell and Son, Rugby	5,113	0	0
Simonds, Reading	5,000	0	0
Macandrews, London	4,940	0	0
Thatcher, Abingdon	4,753	0	0
Wiltshire, Swindon	4,719	0	0
Polley, Oxford	4,705	10	0
Martin, Maidenhead	4,678	0	0
Wernham, Reading	4,660	0	0
Hunt, High Wycombe	4,593	0	0
Colborne, Swindon	4,500	0	0
Grant, Banbury	4,297	0	0
Wheeler, Abingdon	4,247	0	0
Buckle, Abingdon	4,100	0	0
Robinson, Wolvercote	3,875	0	0

BATTERSEA, S.W.—For the erection of a school in Ethelburga-street, Bridge-road, Battersea, to provide accommodation for 1,474 children, and a house for the schoolkeeper, with a laundry and a cookery centre, for the London School Board:—

		A.
King, W., and Son	£21,394	£368
Downs, W.	20,590	385
Collinson, J. F.	20,494	305
Hart Bros.	20,462	554
Nightingale, B. E.	20,260	433
Holliday and Greenwood	20,146	433
Foster and Dicksee	19,999	330
Lathey Bros.	19,970	390
Wallis, G. E., and Sons	19,897	348
Lovatt, H.	19,823	347
Holloway Bros.	19,780	347
Lawrance, E., and Sons	19,209	391
Patrick, J. and M.	19,207	370
Stimpson & Co., Brompton	19,100	445

A.—If brickwork be built in cement, add.

[(*a*) Cost of school-buildings and closets, £15,450; (*b*) tar-pavement and playgrounds, £680; (*c*) boundary walls and gates, £710; (*d*) three teachers' rooms, £300; (*e*) cookery and laundry centres, including schoolkeeper's house, £1,600; (*f*) extra depth of foundations, £360; (*g*) brickwork built in cement, £445; total, £19,545. Cost per head of (*a*) only, £13 3s. 2d.; total cost per head, £16 12s. 11d.]

BERMONDSEY.—For work to be done in putting new corrugated iron roof, &c., to the south-west wing of the Bermondsey Workhouse, for the guardians of the St. Olave's Union. Messrs. Newman and Newman, 31, Tooley-street, London Bridge, architects:—

Harbrow	£179	0	0
Wells	150	0	0
Barrett	85	0	0
Bullers (accepted)	83	0	0

BILSTON.—For supplying complete electric installation and fitting up the electric light in the public markets, Bilston. Mr. Wilson, C.L.N., borough engineer:—

Waring, S. J., and Sons (accepted)	£450	0	0

BRENTFORD.—For the erection of the potato warehouses at the Market, for the local board. Plans by Mr. J. H. Strachan, late surveyor to the board:—

Perry and Co., Bow	£1,500	0	0
Belham and Co., London	1,414	0	0
Barnes, J., Brentford	1,280	0	0
Bendon, T., Hammersmith	1,260	0	0
Foord and Sons, Brentford	1,241	0	0
Kellett, A., Willesden	1,210	0	0
Ball, J., Chiswick	1,198	0	0
Bloomer, J., Brentford (accepted)	1,150	0	0

[Surveyor's estimate, £1,250.]

BRISTOL.—For fences and gates at Eastville Park, for the town council:—

Parker, G. (accepted)	£335	0	10

[Lowest tender received.]

CARDIFF.—For new Baptist chapel, Splott-road. Messrs. Habershon and Fawckner, Pearl-street, Cardiff, also Newport, Mon., architects:—

Jones, D. C., and Co., Gloucester	£4,953	0	0
Stephens, Bastow, and Co., Bristol	4,749	0	0
Allan, J.	4,643	0	0
Knox and Wells	4,600	0	0
Dunn, C. C.	4,575	0	0
Best, W., and Co.	4,411	15	0
Turner and Sons	4,400	0	0
Morris, T.	4,378	0	0
Lattey and Co.	3,378	0	0
Hatherby and Carr, Bristol	4,295	0	0
Davies, H.	4,251	11	0
Robins, F. G.	4,112	0	0
Tagflo, Farnham, Surrey	4,100	0	0
Wood, T., and Son	3,997	0	0

(Rest of Cardiff.)

CARDIFF.—For additions to Broadway Schools, Roath. Messrs. Habershon and Fawckner, Pearl-street, Cardiff, and Newport, Mon., architects:—

Gough Bros.	£870	0	0
Howell, A. J., and Co.	840	0	0
Robbins, F. G.	830	0	0
Copp, W. R.	824	0	0
Davies, H.	795	0	0
Hallett, G.	780	0	0
Beer and Sons	752	0	0

(All of Cardiff.)

CARDIFF.—For new mission-hall, Grangetown. Messrs. Habershon and Fawckner, Pearl-street, Cardiff, and Newport, Mon., architects:—

Davies, D. J.	£3,200	0	0
Firbank, J. H., Newport	2,955	10	0
Dunn, C. C.	2,950	0	0
Griffiths, G.	2,950	0	0
Best and Co.	2,905	14	0
Lattey and Co.	2,865	0	0
Hatherby and Carr, Bristol	2,853	15	7
Trotman, E., Barry	2,837	0	0
Howell, A. J., and Co.	2,836	2	9
Evans, E. R.	2,834	0	0
Wood, T., and Sons	2,830	0	0
Shepton and Son	2,785	0	6
Davies, D.	2,778	0	0
Gibbon, H.	2,700	0	0
Rutter, G., Barry	2,647	0	0
Turner and Sons	2,638	0	0
Davies, H.	2,579	0	0
Knox and Wells, Bangor	2,368	0	0

(Rest of Cardiff.)

CHELMSFORD.—For the erection and completion of six working men's cottages, for the Chelmer and Blackwater Navigation Company, Chelmsford. Mr. F. Whitmore, Chelmsford, architect:—.

Rayner, East Manningfield	£806	0	0
West, E., Chelmsford	797	0	0
Kennell, H., Writtle	779	0	0
Tunbridge, W., Cressing (accepted)	737	0	0

Potter, H., Chelmsford, received too late.

[Architect's estimate, £780.]

COLEFORD.—For the provision of pumps and gearing in connection with a water-supply to Coleford, for the Frome Rural Sanitary Authority:—

Warner, R., and Co., London (accepted)	£170	10	0

CORSHAM.—For the erection of school buildings at Corsham, Wilts, for the Corsham school board. Mr. Harold Brakspear, A.R.I.B.A., Corsham, architect. Quantities by Messrs. Pinks and Watson, 45, Parliament-street, S.W.:—

Hyde, I., Keynsham	£3,915	11	0
Jones, D. C., and Co., Gloucester	3,789	0	0
Tight and Smith, Chippenham	3,617	0	0
Wilkins, G. H., Bristol	3,444	0	0
Beazley, W., Calne	3,410	0	0
Francis, W. H., Trowbridge	3,150	0	0
Downing & Rudman, Chippenham*	3,057	0	0

[* Accepted, subject to approval of the educational department.]

DORCHESTER.—For alterations and additions at the Swan Inn, Fordington. Mr. A. L. T. Tilley, 16, Cornhill, Dorchester, architect:—

Guy, J., and Son	£755	0	0
Davis, R., and Son	749	11	11
Slade, C. E.	743	0	0
Barrett, C. E. (accepted)	614	12	5

(All of Dorchester.)

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXVII.—No. 2076.

FRIDAY, OCTOBER 19, 1894.

THE PROFESSION AND THE BUILDING TRADES.

IN the course of a few days the Architectural Session will have commenced its work, and many subjects of more or less interest to the profession will be discussed. First and foremost, the presidential addresses will review the questions of the year, and especially draw attention to the merits of the new London Building Act—a topic that alone will make the beginning of the session of 1895 a notable and crucial one—the progress made in educational matters, to great works achieved, and so on. No greater question than that of the relation of the profession to the contractor and the building trades, and the position of each, can occupy attention. Certain matters call for solution before the true position of the architect can be ascertained. First, what is to be done with the "unqualified genius," the intractable individual who will remain an architect, despite all the attempts to enrol him as a qualified member of the profession, or in defiance of all legislation to place him on the register? If not accepted as a member of a society, or registered as a qualified practitioner, he will still exercise his art amongst those who have confidence in his genius and skill, and will still be retained to prepare the designs for men who have "passed" but have no artistic ability. Like those who have no valid medical degrees, they will remain outside the pale, and form a class strong enough to become powerful rivals to their regular brethren. The unqualified genius will make himself a power, whether we like it or otherwise; he is not to ousted—he will appear as the "ghost," despite his ignorance of practical matters and construction, and therefore it is we must recognise his existence in the future as in the past. His qualifications as a designer cannot be gauged by any examination, for they elude any sort of analysis of styles or mouldings. His power of expressing any idea cannot be acquired by expertness in mechanical draughtsmanship. All these facts, and many more, have been ably put forth by essayists in a recent work entitled: "Is Architecture a Profession or an Art?" Beyond all these arguments, we have the unquestioned fact that the greatest periods of our historic architecture were without any means of testing the qualifications of its masters; our great buildings were designed and erected by men who had no professional training, before the age of learned societies and technical colleges appeared.

Next we have the question of the functions of the professional architect. We have here another subject which may well occupy the attention of architects at the present time. There are many who believe that the professional man should devote his time only to the general design of buildings, be a gentleman by education and training; others who assert that the architect ought to become a leader of workmanship, superintend the several tradesmen, and be practically a "master workman" in the old sense of the word. Whichever is it to be? One or the other. We can understand the first position as one in accord with the supercilious "professional" architect, who thinks he is too important a personage to meddle with bricks and mortar, and timber, or details of buildings, drains, and so on. Anything to do with quantity surveying is also repudiated by a certain clique, though not by all, for there is remuneration attached to it. On the other hand, the "master workman" ideal is not very popular amongst the profession, and, as far as we can see, still less popular among the builders and contractors. Perhaps the reason is not far to seek. If every architect was a "master workman" it would be much the worse for the contractor, who likes to have all his own way, and to have control over the workmen; it would be certainly harder for the scamping contractor, who acts the part of middleman. The builder is an important factor in the situation, as being between the architect and the workman, and the sooner the relations between the two first is fully recognised in its many bearings, the better it will be for everybody. Now, from what we know of a large class of builders, there is a natural desire on their part to regard the architect as a "stand-off" sort of gentleman, who will not trouble to interfere in building operations, who will not condescend to visit a building too often, who will refuse speaking to foremen or workmen except through them, the recognised channel of the clerk of works, and whose knowledge of construction is of a theoretical, superficial kind. Their desire is that the architect should be a kind of "figure-head," and should intrust his duties to a qualified surveyor who should take out the quantities, and be responsible to the builder as well as to the employer. The builder likes someone who is practical to deal with, who understands prices, but not one in supreme authority; he can do very well with a competent quantity surveyor, but scarcely so well with a vigilant clerk of works, who is always looking about, and is in touch with the architect. The commercial builder tries to widen the gulf between the designer and the workman by placing himself in the breach. Any bridging of the gulf is fatal to his success.

In connection with this vital question of the function of the architect, whether he should be merely a general supervising agent or artist, or a master workman, is that of the direct employment of labour as exemplified in the London County Council's determination to dispense with the contractor, and to engage their own staff of workmen under the supervision of their own officials. We are unprepared to say whether any advantages have been secured by this arrangement, although it has been alleged that it has resulted in a saving of 12·33 per cent. on the first 16 operations carried out by the Council, and the results of its adoption by the Birmingham Corporation have been, we are told, even more satisfactory. By giving an opportunity to competent craftsmen to work at reasonable rates, a new era of workmanship will be inaugurated; the workman is brought into direct contact with the designer, and all "sweating" will be avoided. Of recent experiments in this direction, the mosaic decoration of St. Paul's Cathedral by working artists without a middleman may be noticed with approval. Certain it is that the position of the workman in building will have to be dealt with before very long. Our technical schools and classes must necessarily lead to a condition of things very different to that which has prevailed. The education of the working artist will be raised, and the effect will be that he will be less disposed to sell his labour in the cheapest market or under the unfavourable conditions that now exist. By raising his skill as an artist, the workman will certainly endeavour to obtain a recognition of his power; he will be less content to become a mechanical producer or to copy line for line, following the instructions of those less competent than himself. Of course, we shall still get skilled experts in the several trades who will never do more than copy correctly, just as we have architects who can only follow a leader, but have no power to create in the true sense of putting things together. We have no doubt our technical schools will turn out hundreds of mere prigs, who will be no better than many who now crowd the market; but amongst them there will be men whom the improved methods of instruction will have lifted to a sense of their real capabilities. We have yet to see what the improved education of workmen will bring about. Will it not alter the relation between them and the builder or contractor?

And if the future working craftsman is to become a master of workmanship, he must have a director. The workmanship ideal of the architect is the only one that will satisfy the new conditions. And what is the consequence? Why, that the two must be brought into closer contact. We have indications now of a movement towards that end. The question of education for London workmen has been raised more than once of late, and the Building Trades' Federation movement and the recent Trade Conference under the auspices of the Technical Education Board of the L.C.C. are within the recollection of our readers. Upon the latter occasion one of the subjects discussed was the decline of apprenticeship, and a committee was proposed to consider the subject. We believe a committee has been appointed with this intention, and that representatives of the architects, master builders, workmen, educational bodies, and polytechnics, besides the City companies, have been invited to take part. The influence of the Science and Art Department, the Technical Boards, the School Board, and the City companies on the workmen will be one of the questions; another meetings for discussion between architects and the building trades. We have often spoken of the necessity of bringing the architect and workman together on their own grounds; to enable each class to see what it may learn of the other, for exchange of views on technical and artistic matters. There are many things in building which cannot be understood practically from offices and books. Take, for example, concrete mixing and plastering. The architect may know everything about limes and cements, and their qualities and properties, as laid down by competent authorities, and yet not be able to say whether a sack of cement is fit to use or not, or the proper way of making "coarse stuff" for plastering. Again, who but the expert mason can say whether a stone is laid on its "natural bed" or not? Or who but the experienced carpenter can tell the difference between yellow deal and some kinds of Swedish timber? In questions of workmanship even more, the workman can impart information of a kind that cannot be learned in any other way than by actual tactical experience. In what way has this or that to be done has often given rise to doubt in the mind of the architect, which a bricklayer or a joiner would have at once answered. The passer of an examination, however perfect, is generally one who makes the test the end instead of the means; he may have no particular wish to do anything more than pass and acquire a certificate of competence—that is all he looks for. As we lately pointed out, the man who takes this view of his profession is far behind one who takes a lifelong interest in his work, who completes his school discipline by self-continued study and reading, and his knowledge of building by making himself familiar with workshop and building operations. The direction of workmanship is no less an object to achieve than that of becoming an expert in drawing or a candidate for a diploma. Unfortunately it is lost sight of in our modern programmes. We turn out men who can design and draw elevations and make plans after a certain pattern, who can imitate leading architects' work, but who have done little to prove that their art has any penetrative influence on workmanship, or has in any direct way raised the standard in the trades.

BUILDING ON LOW SITES.

THE absolute necessity of prohibiting the erection of buildings, especially those intended for dwelling-houses, on ground or plots that are little better than swamps, is increasingly evident to everyone who knows to what dire straits the inhabitants of certain districts in the Metropolis are reduced when any heavy rainfall takes place. Portions of Hammersmith, Fulham, Putney, Wandsworth, Battersea, and other parts are subjected to periodical inundations, the basements of houses deluged, and many living-rooms rendered uninhabitable. But for the low intercepting sewers, some of these districts would be rendered uninhabitable during certain periods of the year. Much of the land has been reclaimed from the river, and is upon a level with, often lower than, the base-line of Trinity high water mark. A great deal of it is marsh land, subjected to periodical overflows of the tide. Yet whole colonies of tenements have been built on these areas without any protest from the authorities, and, what is worse, no provision has been made to keep back the underground water. Things have been a little better under the present rules. But large, densely populated areas have been covered by dwellings at a time when the sanitary legislation of the metropolis was in a very imperfect state, and when the Building Acts did not do anything to abate the evil, and no by-laws existed as to the foundations and sites of buildings. The ablest hygienic authorities assert that if the ground water is at a permanent level of 5ft. or less from the surface, the ground air is necessarily cold and damp. Our own experience proves that this limit is not far wrong. In the localities we have named the ground water-level is often higher, making it impossible to provide for basements. The new London Building Act, which comes into operation at the commencement of the new year, will reinforce the present section, 56 & 57 Vict. sec. 5, and make it more impossible to erect any building to be used wholly or in part as a dwelling-house, or to adapt any building for the same purpose on land of which the surface is below the level of Trinity high-water mark, and which does not admit of being drained by gravitation into an existing sewer of the Council, except with its permission, and subject to such regulations as they may from time to time prescribe. Certain defined areas of such land will be excluded from such dwellings or buildings. The Council will have power to, first, prohibit the erection, and second, to regulate their erection, and third, to "prescribe the level at which the under-side of the lowest floor of any permitted building shall be placed on such land or any defined area," &c. These regulations are, however, subject to appeal. The last-quoted clause is a new one, and will have the effect of practically preventing the construction of any basement or cellar to small houses on land of the kind we have supposed, for few builders will care to raise their ground-floor level 5ft. or more above the level of the street. Without this third clause of the 122nd section, it would not be difficult to find some means of getting over the difficulty, for merely to "regulate the erection of dwelling-houses" may be made amenable to several interpretations.

The prospect of this more perfect legislation will no doubt cause some dismay in the minds of a large class of builders of small properties. No doubt many will take advantage of the existing law as being less stringent. The present bylaws as to concrete foundations and sites (section 16), 41 and 42 Vict., have greatly benefited dwellings erected since these rules came into operation; but we are not so sure about the application for a license to erect dwellings on such land now in force, or whether the decision of the chief engineer of the Council has been in all cases obtained. From our own observations there appears to be some laxity in enforcing conditions. Houses have been built with basements much too low to insure dryness. This reminds us of the absolute importance of defining terms. The new Act speaks of the "lowest floor" in the clause we have quoted. What does this mean? The ground-floor or the floor of any basement or cellar? The point is one that should at least be made clear, for it will make all the difference if the "lowest floor" is intended to apply to the ground-floor. The term "story" is defined, and the word "floor" ought to be rendered quite explicit as to its meaning. The phrase "habitable room" is also explained, and we might suggest to the Council the words: "Prescribe the level at which the under side of the lowest floor of any *habitable room* shall be placed, &c.," as being more definite.

The absolute importance of securing the lower parts of buildings against moisture or floods, has been recognised by all sanitarians, medical authorities, hospital designers, &c. No one now thinks of building a ward block without taking care it shall have a free ventilation under the lowest floor, either by means of raising the building sufficiently to allow of openings all round the walls above the ground level outside, or by a sunk area or a sloped bank all round to promote the same object, namely, the cutting-off the building from the soil. Suggestions have been made for building our houses upon open arches or stilts; we think it was Sir W. B. Richardson's idea. Others have devised systems of "plating," so to speak, the outer walls and floors of sunken basements with asphalte, and of concreting and asphalting the site in soils subject to saturation, and we have many excellent materials, such as the "hygeian rock building composition," certain qualities of asphalte, and other damp-proof materials, which exclude moisture from walls and foundations. No doubt the London County Council will have to consider and weigh the merits of new methods and materials, for many of them will no doubt be brought into requisition by those who will not be slow to adopt methods to evade the Act. The Council will have an optional power, and may in some cases be disposed to favour certain plans for securing the object in another way. We shall hear of many schemes for avoiding the Act and obtaining a license to erect buildings, and invention will be stimulated no doubt in this direction. Every builder will have the opportunity of appealing to the Tribunal of Appeal, and no doubt will not be slow to avail himself of any alternative that may offer.

DISCOVERIES IN ARCHITECTURE.*

CAN there be such things as discoveries in architecture here, and now at the end of the nineteenth century? I fancy that I hear some persons under whose notice the announcement of the subject of this lecture may have come put this question, with a quiet idea that it ought to be answered in the negative. It is my intention, however, to show, in addition to some notice of past discoveries, that there are, and will be, discoveries in architecture at the present day; and, what is more, that some of these discoveries should await yourselves, if you are to succeed as students. Let us first, in order to clear the way, make sure as to what a discovery really is, and what it is not. Discoveries and inventions have been so mixed up in people's minds, and are so often intimately associated in actual fact, that perhaps the first thing to point out is that a discovery is not an invention. You discover something that exists; you invent something which has not existed before. Discovery is the proper reward of research; you dig in order to uncover what is hidden. Research is the digging process; discovery happens when you dig successfully. Experiment is the usual method by which invention is forwarded. You think of the best means of compassing a result, and then you make a trial. In architecture, the way of making that trial is by making a drawing, and one of our main difficulties is that from the best drawing to a finished building is such a long step. Very many inventions, especially scientific ones, have not only been based upon discoveries, but have followed close upon them, or have gone, so to speak, hand in hand with them, so that the distinction between discovery and invention has, in such cases, become obscured; but it is a very real one. Let us illustrate it by an example or two. One of the greatest discoveries of modern times was the discovery of America. One of the greatest inventions was that of printing. At any rate, these two great feats serve to illustrate extremely well the leading distinction between invention and discovery. America was there (and had been there for ages) when Columbus first reached its shores. He in no sense created or invented America; but he did discover that country. On the other hand, printing did not exist before the days of Gutenberg, if he was the inventor of printing. Writing existed, it is true, and the first printing was an imitation of writing; but the power of reproducing a number of copies of the same document by using movable types had never been obtained before. Printing did not exist—it was invented, and thenceforward it remained one of the arts of civilisation for all time. The word "discovery" signifies an uncovering of something covered up—a bringing to light something that is hid. It is (let me add) a personal thing, and though it is often enough followed by the making public of the discovery, that is (please to note) quite a separate matter, and may be postponed or omitted. Columbus discovered America on the day the hazy outlines of a distant coast began to rise over the dim margin of the ocean, not on the day when he returned to Europe the proud bearer of the tidings that there was a new world to conquer. The discoverer of the richest gold mine in Queensland kept the knowledge to himself for years till he could buy the land in which it is situated. Once more (and this is an important consideration) a discovery is so much a personal thing that it is not essential to its being a discovery that the object discovered should be unknown to everyone else. When Speke and Grant discovered the vast lake in the heart of Africa they found a geographical feature previously unknown to themselves and to Europeans generally, but familiar enough to the hundreds and thousands of African natives who lived on its banks. Nay, even if a man literally uncovers a buried relic, such as a Roman pavement found in the heart of London under 10ft. of accumulated soil, what he uncovers to-day is indeed to him a discovery; but it was familiar enough to the Roman artist and artisans who designed and made it, and to the Roman soldier or colonist whose house it adorned, and whose friends and family were constantly walking over it. Discoveries of things absolutely and always unknown are always rare; and in some branches of study—architecture among others—are in the nature of things impossible. But in the sense of finding out or uncovering something previously unknown to the discoverer discovery occurs frequently, and it is by far the most healthy, the most interesting, and the most successful form of study. I propose, then, in this lecture, to begin with the simple, but most valuable, discoveries which you as students must make for yourselves if you are really to master the art of Architecture; and then to proceed to notice some of the discoveries which have taken place in recent years which are more brilliant in their character and relate to architectural matters that have long lain hid. I propose to distinguish these, and call them respectively personal and public discoveries; for there is this distinction certainly between them, that the discoveries which a student makes are mostly of importance to him personally, but are not such as need be made public. Those which an explorer may make are perhaps quite as important to the general public as to the discoverer, and are usually published to the world.

PERSONAL DISCOVERIES.

The information you obtain in the offices where you work, or from attending classes like those about to begin in this college, is hardly discovery; it is instruction, and the worst of it is that, as it is not difficult to get, it is very apt not to stick in the memory. The information discovered by making researches on your own account is mostly obtained with difficulty and trouble, but it is seldom, if ever, forgotten. You may make discoveries in a library. For example, let us say that you are advised to read a handbook, say "Fergusson's History," and you do so, finding it perhaps a rather laborious task, as the reading of any condensed book always must be. You notice, however, that the numerous woodcuts all have references to the names of writers from whose publications they are copied, and having access to books, say to the Institute library, or that at South Kensington, or some other collection of books, you begin to consult some of the original authorities, and among them you discover some book of which the illustrations or the letter-press, or both, bear on what you have been reading about, and are full and clear and interesting. The book you have discovered only occupies a corner of the vast field that Fergusson travels over; but then the writer really has the leisure to take possession of that corner, and to throw a clear light upon it. The mere fact that you have to some extent unearthed the book for yourself helps to give a zest to the reading of it, or the examination of its illustrations. It is a discovery. Nor is it in a public library only that such discoveries can be made. In any collection of books or photographs or prints to which you have access, and on the shelves of second-hand booksellers and the tables of bookstalls, you can have the same good fortune. I, for example, myself possess not a few valuable books on subjects connected with architecture which first came to my knowledge through finding them on bookstalls. This reference to discovering books ought not to be made without alluding to the help to be got from one very valuable book of reference, which just now possesses a melancholy interest for some of us. I allude to the "Dictionary of Architecture," of the Architectural Publication Society, a work bristling with sign-posts—if I may use such a phrase—calculated to direct the student (in his search for knowledge) to the best sources of information. In almost all the articles the most copious lists of references occur, and it is of the greatest use to a real student to have sources of information so liberally spread before his view. This work (begun by a circle of architects, some of whom only have survived to see its completion) would have been left unfinished but for the indomitable energy and public spirit of Mr. Cates, and the learning and patience of the late Mr. Wyatt Papworth, and it is impossible just now to mention the "Dictionary" without alluding briefly to the great loss which architecture has within the last few weeks sustained in the recent death of the last-named architect (Mr. Papworth). He was full of accurate and well-digested information on every subject connected with our profession. He was an indefatigable, systematic, and accurate worker, singularly quiet and simple in his manner and bearing, and was universally esteemed. In many ways his vast store of technical information has been made useful to the members of his profession. To you, gentlemen, his work, as editing Gwilt's "Dictionary," the value of which he practically doubled by the additions he made to it, is pretty sure to be familiar; but there are many others, and many important memorials of him in the literature of our profession, and his death leaves a blank which it will not be easy to fill up. To return, however, to students' discoveries—of which, by the bye, the late Mr. Papworth made many and valuable ones—architecture can be better learned from buildings than from books, and it is in visits to buildings, ancient and modern, that you will make the discoveries that will be of most use to you. The most simple building, if it is good, has some secrets, if you can but make them out. Why is it pleasing? Why are there certain irregularities? How is it constructed? What has been its history as a structure? These, and such-like questions, should present themselves to the mind, and if we can but discover the answer to one such question, the visit to the building in respect of which it is asked will have been fruitful. Among the most interesting features of ancient buildings are the traces of their history which they bear indicating the successive enlargements, alterations, rebuildings, and so forth, which they have undergone, and the discoveries of this sort which a keen student, examining an old manor house or a church, a cathedral or a castle, may make for himself are extremely interesting and extremely instructive. One of the most complete accounts of such a series of discoveries illustrating the past history of a great building by its actual visible marks exists in the account of Canterbury Cathedral, from the pen of the late Prof. Willis. No man during the present time of careful research has been more keen or more successful in his examination of ancient buildings than he, and this record is a good example of the manner in which it is possible to make them tell the story of their varied changes, alterations, rebuildings, and extensions. Even without a tenth part of the minuteness and elaboration of Willis's investigation, if you simply establish the broad divisions of Saxon, Norman, Early English, and so forth, in a building with a chequered history, and recognise the most obvious features of each period, you will have discovered the leading facts in the history of the building. In this sort of research it is peculiarly true that "to him that hath shall be given." To a person even of artistic taste and power of observation, entirely devoid of architectural knowledge, a building is almost a sealed book; but when you have got even a little knowledge from other sources a building begins to be legible. As an example, I would suggest to any student who has read something of the changes in tracery, in vaulting, and in mouldings which occur in English architecture, that when he has obtained some knowledge of these things from books he should go to Westminster Abbey cloister, getting first from Scott's book the dates at which it was done, and identify the different features of each period, and the changes both in feature and in general proportions. He will find that he has discovered a good deal of what is really meant by the terms Early English, Decorated, and Perpendicular. It is possible to make discoveries on drawings of buildings as well as on the buildings themselves. As an example of what I mean: If you take the drawings of one of Sir Christopher Wren's churches, and examine them carefully, you may perhaps discover some of the principles upon which he designed them. He was a very orderly and mathematical worker. He had strongly impressed upon his mind the conviction that the establishment of geometrical relations between the main dimensions of his building was a means of securing that their proportions should be pleasing, and if, with this clue in your mind, and a pair of dividers in your hand, you examine a series of engravings giving the plans, sections, and elevations of his churches, and St. Paul's Cathedral, you will, I think, find it possible, and extremely instructive, to discover some of his methods of working. The plan and sections of St. Stephen's Church, Walbrook, generally recognised as the best among Wren's many successful interiors, will be very good to begin with. A famous place to investigate is a good museum. I doubt whether any one of you has seen, let alone studied in, all the museums of London which furnish information about architecture, though I hope most of you have studied, or will study in some. The first, of course, is the British Museum, where a very considerable amount of examples and specimens of Ancient and Classic architecture exist. Setting aside the library, which is enormous, there is a great deal of Egyptian, Assyrian, Lycean, Greek, and Roman work to be seen there, chiefly in the shape of fragments of ornament and features, such as a capital from the Parthenon, and parts of a sculptured column from the temple of Diana at Ephesus. The South Kensington Museum and the connected Indian Section include a great deal of Gothic Renaissance and Oriental architecture and a magnificent collection of casts, practically as good as the originals for our purpose. Another, and perhaps a finer, certainly a better classified collection of architectural casts exists at the Crystal Palace, and a third of Mediæval work at the Architectural Museum. Sir John Soane's Museum, a collection made by an architect to illustrate his art, must not be forgotten, and in every one of these a visitor, going with some knowledge to start upon and a spirit of research, cannot fail to make discoveries that will be both profitable and pleasant. We have spoken about discoveries in a library, in a building, in a set of plans. There are also discoveries in a city. Here in London, architects of more or less skill have been designing and building for a thousand years. Much of their work (good or bad) has disappeared; for the relentless tooth of time has been eating it away almost as fast as it has been done—but not quite, and so in this metropolis a vast mass of architecture, of course chiefly modern, is accumulated. The Great Fire destroyed most of the earlier work, but not all of it, and even putting that aside as most of it too well known to leave much room for discovery, there remains work of the 17th, 18th, and 19th centuries, not a little of it hidden away, to reward the diligent investigator. This is especially true of interiors. In the parts of London which were fashionable a century ago, and where large houses were erected which are now used for different purposes—such, for example, as Lincoln's Inn-fields—you may often discover most interesting fragments of architectural work. There are a few of the Companies' halls which contain good work, but little known, and in one shape and another there is a good deal to discover in Domestic and Secular buildings, of which the authorship may often not be known, but which is appropriate and beautiful. A long series of architects, since the days when the work of the individual architect came to be known by his name, have wrought in London, and though their prominent works may be well known, even these (some of them) may be now in obscurity, and of the best known it is, generally speaking, only the outside that nine observers out of ten have troubled themselves about. London has specimens of the work of Inigo Jones, Wren, Hawksmoor, Gibbs, Chambers, Soane, the brothers Adam, Wilkins, Cockerell, Barry, Pugin, Smirke, Scott, Street, Burges, Sedding, F. P. Cockerell, and many others. Here, too, are specimens of the work of able architects now living, whose designs are influencing the course of public taste at the present day, and are, perhaps, almost as much worth your study as the work of any past age. How many of these do you know about? How many remain to be discovered? And even of those you know, how many interiors have you seen? To go a step further, every cathedral-town in England, every great city, every country town, and pretty nearly every village contains an example, or a group of examples, of architecture in which there is much that you can only known by discovering it for yourself; and even if England has been very thoroughly examined, and a great deal of all the architectural work has been more or less described and illustrated, there is a vast amount that is practically unknown. This is especially the case with English mansions and manor-houses, many of which, if illustrated at all, are in many cases only known from picturesque perspective views, and are not illustrated in such a way as to give an idea of their wealth of architectural treatment. The visitor to Penshurst, Knole, Hever, Bramshill, Purham, Audley End, Westwood, Hatfield, or Woollaton, or Burghley will find plenty of architectural discoveries to make, even though each of these mansions may have been more or less illustrated. That an architect should overhaul the church in any village or town where he may be, if it be of good design or possessed of features of interest, is, I hope, so much a matter of course, that I do not stop to point out how much can be discovered and appropriated in journeys and country rambles; but I am disposed to dwell upon the modern work which awaits the traveller in various parts of England. The country is now thickly sprinkled with fine mansions and smaller country houses, nearly all of them good, and many of them extraordinarily good. The towns are now distinguished by their town-halls, their banks, and other public municipal buildings, and often by the possession of a hospital or the neighbourhood of an asylum of the greatest possible interest, in many cases, to the student of sanitary science. Individual towns also have the impress of the work of architects of genius who have practised chiefly in and round them. You must go to Glasgow and study the work of Thomson; then if you want to know how Greek architecture can be turned to account in supplying the architectural treatment of modern Scottish warehouses and churches, and you will in Manchester learn what a genius Walters was; but there also, and in Liverpool and in the great cities of the North of England, you will find modern work of the greatest possible value done by good architects still living and working among us. Discoveries are more obviously awaiting the traveller who may cross the Channel. It is quite true that France, Italy, and Germany have been visited again and again by keen observers, and the results published; but even so you must see the building and judge for yourself before you can grasp what is meant. Even in the most familiar building—St. Peter's at Rome, or Nôtre Dame at Paris, or St. Mark's at Venice—there is a world of unpublished facts to discover, and much more is this the case the moment we step off the beaten track. France especially is full of good architecture that is very little known in England, and there would be no great difficulty there in practically discovering a first-class church, perhaps even a cathedral. Spain is full of architecture very little published; the East is full of what is yet practically unknown. With regard to modern work, the discoveries that await an observant architect travelling on the Continent, and taking the opportunity of visiting the great cities, are startlingly numerous and strange. I have no doubt that a visitor to the United States would find them not less numerous, and certainly not less startling; but I have not been so fortunate as to see America, and I will not attempt to describe the new architecture of that great country, though I am convinced that there is a better chance of the development of a modern style of architecture in the United States than in any part of Europe. Remaining nearer home, however, the architect who will visit the great German cities, such as, for example, Frankfort and Cologne, Brussels and Vienna, will discover that the Renaissance style on European soil is really capable of new and striking developments which we have rarely attempted. Miles of new boulevards and streets are to be seen in these and in other Continental cities, full of elaborate, vigorously-designed, and costly buildings—all of them (so far as they can be classed as belonging to any style) of Renaissance character, but every one of them differing from the types we have studied and are reproducing. Here, if anywhere, there are discoveries to be made in modern architecture. I do not say that the buildings are all good; but many of them are. I do not say that the details are pleasing—they are often too coarse for that; but there is a freshness, a suggestiveness, and a sense of vigour about these boulevards which make up for a good deal of the deficiency in refinement. In thus considering what at the outset I called personal discoveries—namely, those which a student must make for himself—I have gone through that part of the subject which probably is of the greatest value to you, gentlemen, as students. But you may have expected that I should also tell you, and show you, something of public discoveries in architecture, and we will now, if you please, turn to that division of the subject. The present age has been one in which extraordinary revelations of the past have been obtained by keen investigation to an extent that could never have been anticipated. Of course, inscriptions, sculptures, ornaments, pottery, weapons, and objects of this sort—but especially inscriptions—have furnished this most remarkable and definite information; but no inconsiderable amount of architecture has also been discovered. Buried remains usually display arrangements of plan rather than entire buildings; but in not a few cases they are dug up complete, while abandoned buildings have been found entire in places now solitary, and ancient structures have been discovered standing in inhabited, but seldom visited localities. Fragments, pavements, ornaments, architectural features, and details, and even representations of buildings have been found in abundance. Discovery in architecture may be considered to have begun, so far as we are concerned with it, at the Renaissance in the 16th century. That great change in men's ideas—the starting-point of modern life and art—began in Italy, and the artists of the Renaissance soon became familiar with the remains of Roman art in their own country, and studied them with eagerness. Several of the Italian architects and antiquaries of the 17th century have left treatises and illustrations of Roman buildings, and their own architecture was based on that of their Roman predecessors. In the 18th century Italian architectural books became numerous, and many of them describe monuments; and some of the Roman remains outside Italy, as, for example, Palmyra, appear to have attracted notice at the same time. In the 18th century, moreover, the study of ancient Roman art was much stimulated by a discovery, in the most literal sense of the word, of the utmost interest and importance. I allude to the digging-up of the buried city of Herculaneum, and later on the better-preserved Pompeii. Herculaneum was known as early as 1711, but excavations at Pompeii only began somewhere about 1750. The course of exploration and discovery thus started went on, and has, with brilliant results, been continued from time to time. Nothing has shown us so much of the details of ancient architecture as the Pompeian explorations. At Pompeii, as you know, an extensive buried town has been laid bare, house by house and street by street. Exploration and the publication of discoveries are still going on there, and though the main public buildings were found and dug out long ago, most interesting houses are still discovered from time to time. It was about the middle of the last century that attention in England was seriously drawn to the remains of Greek architecture by the publication in 1762 of the "Antiquities of Athens" by Stuart and Rivett. Though Athens was a well-known city, this careful examination of the most important architecture to be found there amounted to a discovery, and the effect on public taste of the publication of the work was considerable, followed as it was very shortly by the "Antiquities of Ionia." Greece and Asia Minor were by degrees most fully explored and described; but Greece has proved inexhaustible, and is at the present day a field of the most interesting modern research. The next great series of architectural discoveries relates to the architecture of Egypt. Napoleon took possession of that country in 1799, and sent with his army an expedition of men of learning and artists, and the temples and such of the tombs as had up to that time been discovered were visited and explored, and a magnificent book full of engravings and descriptions was published. Since that day this work of exploration in Egypt has been carried further, and the magnificently-illustrated work of Lepsius, in twelve folio volumes, has published to the world the results of a great German exploring expedition there in the years 1843-5. In Egypt, also, exploration and discovery have still gone on, but, of course, the greater part of the recent results belong to the domain of archæology rather than architecture, though the profession of Egyptology in this college has been successful in recovering much that is interesting as to Egyptian buildings. Some other fields of architectural research should not be overlooked. For example, in Asia Minor, Caria and Syria were explored successfully by Sir Charles Fellowes, and Central Syria has been visited with successful results by M. de Vogüé, whose discoveries are of the deepest interest in the deserted cities of Roman origin of Central Syria. His book gives representations of buildings of a sort of Roman architecture, still entire, of great grace, skilfully designed and excellently built, and standing unoccupied and uncared for in the Syrian deserts. I ought not, perhaps, to omit the many discoveries of Roman architectural remains which have taken place in this country. Usually not much more than the stumps of the walls, showing the plan of the building, the hypocausts, and in many cases the richly-ornamented tesselated floors are recovered from such places as Silchester and the various Roman villas, but even so much has great interest and value; and in a few cases, especially in the fine Roman Thermæ at Bath, excavation has brought much more to light and has revealed most of the architectural features of work of a highly-finished character, very well preserved and striking. It is by the spade that the most remarkable discoveries of modern times have been won, and none of them is more valuable than the recovery of Nineveh and other Assyrian cities by Layard, Botta, and Place. Much which is not architecture has been won for us in Assyria. We have been enabled to read the letters, the books, the very accounts and ledgers and cash-books, and we have received a flood of light upon the history of all the nations of antiquity so dazzling that perhaps the architectural part of these discoveries has become forgotten. But we have recovered the plan and the lower parts of the walls of several palaces of the utmost magnificence and complexity, and we have representations of others on the alabaster sculptured slabs which extended not only for feet, or hundreds of feet only, but for miles, along the face of those palace walls. Of ancient Persia, the ruins were not buried in sand and earth to the same extent as in Assyria, and they have suffered much ruin; but here again the spade has, within no very distant period, brought to light objects of surpassing interest. A French antiquary and his wife, Mons. and Mme. Dieulafoi, have discovered and brought home splendid specimens of wall-decorations, as embossed, glazed, and coloured brick-work, now displayed in the Louvre, Paris. The gradual spread of knowledge about countries outside our own shores has brought to light architecture, not so startlingly new as was revealed by the digging up of Pompeii or the opening of the tombs of the Pharaohs at Thebes, but still of moment. These discoveries occurred to some extent in the 17th century, and to a great extent in the 18th, so that in the best-known countries, such as Greece and Italy, the explorers of the 19th century have chiefly been occupied by making our knowledge more complete. Such work, for example, was done by Professors Cockerell and Donaldson, and by Mr. Penrose, in Greece and Asia Minor. Such also was the discovery of the ruined remains of the Mausoleum at Halicarnassus, by Sir Charles Newton, and the recovery of the long-lost Temple of Diana at Ephesus, by the late J. T. Wood. The startling results obtained by Dr. Schliemann at Mycenæ at Tiryns, include the recovery of two Greek fortress-palaces, at any rate of the plans, and that of the fortifications which protected them, and of decorative details of great interest. Research at Athens, at Olympia, at various other ancient sites in Greece, and in Cyprus, Asia Minor, and elsewhere has gone on, and is being prosecuted with interesting results, and it has also been prosecuted with vigour and success in Rome. Very much is now known about the ancient buildings of Rome which was only matter of conjecture 20 years ago, and there is, no doubt, more to follow. Before, however, we wander too far from them, we must for a moment turn to the discoveries that have been made in Christian and in Oriental architecture. We had detected, before all this was carried so far as I have taken it, an English architecture of the greatest variety and beauty, and had learned that there corresponded with it a French, an Italian, and a German Gothic style with countless examples. The important Mediæval buildings of almost all Christendom, except perhaps Spain and Portugal, have been, it is said, discovered and thoroughly examined, measured, photographed, and described, and are as well known for the most part as ordinary methods of publication can make them, and yet there is not a single one of them which is not the depository of artistic secrets not enriched by subtleties or ornaments, which are not for the first-comer, all of them waiting the earnest student to discover them. Nor are the possibilities of finding more startling novelties than we expect exhausted. Very recently a large series of photographs, representing Christian churches, chiefly Mediæval, in towns and cities in Apulia, on the shores of the Adriatic, have made their way to London, and we find that at Bari Botoub and the neighbouring places an Early Italian Gothic flourished, bearing a far closer resemblance to the Gothic of Western Europe than is found in the Gothic buildings of the better-known Italian cities of the west. These photographs are an example of the fact that, well as Italian art has been studied, it remains an inexhaustible mine. There remains still one phase of Christian art, where much in all probability still awaits the inquirer. I allude to the art of the Greek Church. Byzantine buildings exist even in Constantinople that are barely known, and much more are they to be sought for in more remote places. Some of them have been lately studied by M. Schulz and Mr. Barnsley, and these will be in time made known to the world in the book of those gentlemen; but more remain. Constantinople, however, reminds us that there are countries not less extensive and populous than European ones with an art of their own, an architecture of their own, and countless examples in the shape of mosques and temples, palaces and tombs. The entire East, though not unknown, is all but unstudied. I quite admit that there is a something in Oriental art which, beautiful as it is, seems to repel European sympathy, if it awakens almost unbounded admiration. But when I mention Egypt, Syria, Persia, and Japan, and above all India and Burmah, I name a whole hemisphere crowded with buildings of interest and importance, of which not one in a hundred is generally known. In conclusion, let me say that if anyone wants a field where discoveries can certainly and readily be made, let him try India.

---

* By Professor T. Roger Smith, F.R.I.B.A., an inaugural lecture delivered at University College, London, on Thursday evening, October 11, 1894.

THE SOCIETY OF ARCHITECTS AND THE PROPOSED EXAMINATION FOR MEMBERSHIP.

THE annual general meeting of the Society of Architects will be held at St. James's Hall, Piccadilly, on Tuesday week, the 30th inst., at 8 p.m., when the election of officers and council for the year 1894-95 will take place. Several alterations have been made in the nominations since the "House List" was published in our columns on Sept. 21st, p. 410—the two members proposed as vice-presidents are Mr. Ernest Day, of Worcester, and Professor Banister Fletcher, while sixteen architects are nominated for the twelve seats on the council, the fresh names being Mr. Edgar Farman, who for many years discharged the duties of honorary secretary with marked efficiency and zeal; Mr. Henry Lovegrove, Mr. W. H. Pertwee, and Mr. Walter M. Thomas, of Liverpool.

The following report of the Council on the membership examination question will also be submitted to the meeting:—

"The subject of the desirability or otherwise of an Examination of Candidates for Membership, was referred to the Council at the General Annual Meeting held in October, 1893, and since then it has been under careful consideration. A Committee was appointed and drew up a series of questions, which were approved by the Council and submitted to the Members of the Society. The replies received have been considered, and the opinion of the Members appearing to be practically unanimous, the Council have decided as follows:—

1. That after October 31st, 1896, Election to Membership will only be open to Candidates who have passed the Society's Examination, with the following exceptions:—

   (*a*) Candidates who are not less than 35 years of age, and have been directly engaged professionally in architectural pursuits, as Principals, for at least seven years.

   (*b*) Candidates who are not less than 35 years of age, and have been directly engaged professionally in architectural pursuits as assistants for at least ten years.

Candidates applying for Membership under *a* and *b* will be required, as heretofore, to submit drawings and other proofs of their professional abilities.

2. That the Scheme of Examination shall be formulated and published before June 30, 1895.
3. That a Register of Students between the ages of 17 and 23 years be open on November 1st, 1894.

   Registered Students shall be pupils or assistants in Architects' offices and be nominated by a Member of the Society, subject to the approval of the Council.
4. Registered Students shall be entitled to the following privileges:—

   Free admission to lectures to be delivered under the direction of the Council in London and the Provinces; a ticket giving admission to the Society's Ordinary Meetings and the use of the Society's Library for reference; and a copy of each issue of the *Journal*.
5. That each Registered Student shall be required to pay 5s. per annum, on November 1st, in each year, and shall cease to be a Registered Student on October 31st next, after his attaining the age of 23 years.

Mr. Edgar Farman has given notice that he will move the following amendments:—

To Clause 1.—"That the following Article be added as Article 11a to the Articles of Association, to become operative on October 31st, 1896: 'Subject to confirmation by General Meeting, the Council shall select from time to time certain Examinations, which shall be deemed Qualifying Examinations for Membership of the Society; and Election to Membership shall be only open to Candidates, approved by the Council, who have passed any one of such Examinations, with the following exceptions:—

(*a*) Candidates who are not less than 35 years of age, and have been directly engaged professionally in architectural pursuits, as Principals, for at least seven years.

(*b*) Candidates who are not less than 35 years of age, and have been directly engaged professionally in architectural pursuits, as Assistants, or as Assistants and Principals, for at least ten years.'"

To Clause 2.—"That the first list of Qualifying Examinations selected by the Council be submitted to a General Meeting, to be called not later than March 31st, 1895."

To Clauses 3, 4, and 5.—"That the consideration of these Clauses be postponed."

◆

A VISIT TO ALDAM HEATON'S ATELIER.

[WITH ILLUSTRATIONS.]

FOR many years, in two large but distinctly unassuming houses in Bloomsbury, situate at the corner of Charlotte-street, and close by the British Museum, a considerable amount of first-rate decorative work of all kinds has been produced, much of it—by which Mr. Aldam Heaton no doubt established his reputation—being connected with the furnishing and enrichment of several charming mansions and country houses which Mr. R. Norman Shaw has erected in various parts of the kingdom. A private atelier of this kind, distinguished for handicraft of the highest class only, cannot compare, and, indeed, is not intended to compete, with either the character or quantity of work turned out by any of those vast Metropolitan emporiums and wholesale manufactories where artificers are employed in great numbers, and big contracts constitute the bulk of the business done. Personal individuality of style and artistic quality, by the very nature of things, can only be insured where the presiding craftsman and designer is intimately associated with every department of his workshops wherein he has created a school of workers, all of whose capabilities are as familiar to him as the members of his own family. Such an establishment, as

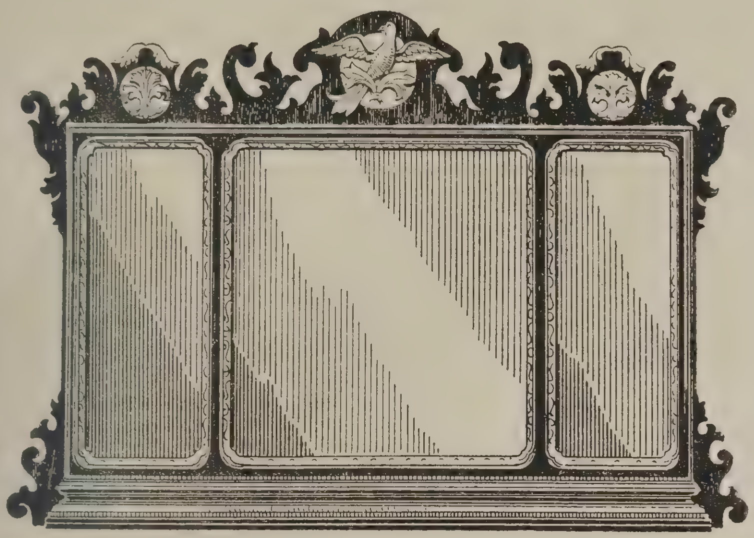
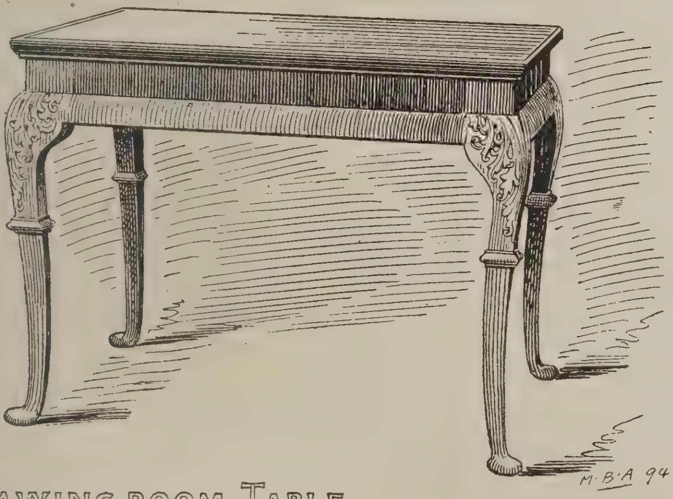
might be expected, presents much that is special in its way and very well worthy of description, so that we propose to place before our readers a brief illustrated account of a recent visit made to Mr. Heaton's studios, where we saw in progress a very varied and most interesting class of work going on. The object of the interview was entirely a practical one, and as such we will confine our notes to the particular points which give so distinct a character to the work which he undertakes. His well-lighted and commodious gallery to the rear of the Charlotte-street premises is a veritable museum of old and new furniture, chiefly old English, and the walls and ceiling of this saloon are decorated in sections to exhibit the usual methods adopted by Mr. Heaton for the treatment of big drawing-rooms and other apartments, and introducing some of the stencil work represented by one of our plates to-day.

The difficulty which all furniture designers must have experienced in producing a satisfactory dining-room ordinary chair is not likely to be forgotten by those who have tried to work out an original design, and probably the task of selecting one is only second in its degree of difficulty. Strength and grace of line, coupled with moderate weight and no undue bulk of scale, are among the conditions of the problem. For small dining-rooms the typical Chippendale or Sheraton chair is too large, and reduced copies look pimping. The gathering of chairs to which Mr. Heaton has given so much thought, when viewed with such considerations as these in mind, certainly leave little to be desired. We noted, too, a feature about most of them which generally is overlooked, and that is the treatment of their back legs, which are finished off with as much care and grace as the front ones. The "Yeoman" chairs, with softly-toned groupings of flowers in marquetry adapted from an old Dutch clock-case, and introduced in the shaped back-piece, and having stamped leather seats patterned with roses by Lethaby, may be named; and the "John Anderson" double armchairs are deservedly favourites. Crocodile skin for seats has the advantage over ordinary leather, for the reason that scratches or stains do not show so readily upon it. The mahogany oval five-o'clock tea-tables, which certainly are pretty, and made in two stages, are contrived to permit refreshments being taken with comfort in the drawing-room by keeping the table-top only 2ft. high. The half "Empire" seats, after Napoleon I.'s favourite chair from the Grand Trianon, like Norman Shaw's "As You Like It" chairs, furnish a room with comfort, and a small series of little walnut sofas covered with French printed jute, or all-wool challis, add grace and ease to any apartment. The sides and edges are covered with plain material, the upper parts only being patterned. The armchairs, which are upholstered with Yorkshire cloth, or mohair satin, specially made for Mr. Heaton, have the arms and headpiece in all cases covered with Utrecht velvet, finished off with sewing-silk fringe. By this means wear is resisted, and. besides, a rich, handsome effect is obtained. We illustrate among our marginal sketches a specimen of the stained-pine and polished furniture, which works out uncommonly well with gesso and gilded foliations, conceived after the fashion of old lacquer patternings in Dutch work. The gesso medium is only used for the bolder parts of the foliage and flowerings, and when dry, the girls who paint them on the wood complete the designs straight away in gold-dust mixed with size. Green stains usually are employed; but a splendid red is obtained by French Hordoré lacquer stain, which, however, is as expensive as good port wine. We have a note of a walnut octagonal table with eight legs, united below by a sort of Flamboyant treatment of rails, prettily moulded and traceried, suitable for a drawing-room or library bay. The Tarsia panels in Zaracotta wood from New Zealand, and inlaid with Spanish olive, suggestive of some designs in the Bargello at Florence, are intended for a dining-car carriage, built by the London and North-Western Railway; and we noticed also some similar exquisite marquetry for the saloon of one of the White Star liners done in walnut with no dyed woods whatever. A great variety of hanging brackets, pier-glasses, and swinging mirrors are grouped about this gallery; and in the next we were much interested in a series of plaster frieze designs, one of which, based upon a pattern enlarged by Mr. Norman Shaw from an old silver bowl, we remember seeing in that Royal Academician's own drawing-room at Hampstead. The chimney-pieces, made in wood, which surround this ante-chamber show off to advantage some choice tiles, made by Mr. De Morgan, to fit their openings. Passing upstairs, we saw the stained and painted-glass studio, where some Gothic-shaped and domed skylights were in progress for the saloons of ships, and a series of exquisite figures for some windows illustrating English poets and authors. In the top ceiling lights Bohemian cut-glass prisms are used, with opalescent whites and "glue-glass," as it is called, insuring a pretty and jewel-like effect. This "glue-glass" is sufficiently obscure to prevent objects being seen through it without obstructing the light, and as it assumes the utmost variety of patterning after the suggestion of fern-leaves or hoar-frost shapings, the ugly monotony of machine-made obscured glass is avoided. The surface is obtained on plate or sheet-glass by painting the ground surface on one side of the glass with glue, and submitting it to the heat of about 90°, when the expansion and contraction between the two materials causes the face to come off, producing very often the most beautiful markings. "Crocodile" glass is produced by water in a similar way, but the skin-like pattern which gives the glass its name, causes splinters of glass to remain adhering to the face of the sheets, rendering it necessary to keep that side well out of reach. Mr. Heaton runs his own leads, fires his work, and completes it all on the spot under his own supervision, the designs in every case being made and executed on the premises. In the adjoining workshops his stencilled papers are made, producing a wonderful diversity of design and colour, combined with a delicate softness. Thus, instead of having the ornament on the walls of a room all of one uniform intensity and definition, no two lengths of paper exactly correspond. The stencils are cut out of cartridge-paper and soaked in japanner's oil size and backed with linen, so as to become perfectly durable, but in the cases of very large patterns metal stencils are employed. Large flat brushes are used by the artists who dab and rub the oil colour on from a big palette, on which several shades and pigments are ready mixed. It is quite impossible to give an adequate idea of the beauty of the decoration often thus obtained, as it were by chance, in this simple way. An all-over ground paper is used, and the powderings of flowers are diversified at the will of the artist. In some, two-widths of stencil foliation is used, reaching in one growing pattern-scroll from skirting to cornice, and so alternating all round the room. In the ceilings and figure-stencilled panels, the work is finished off with the brush by hand. Mr. Heaton is now in this way decorating the Wellington Assembly Rooms, at Liverpool, with stencilled papers. His 10-flock "Abinger" pattern ceiling-paper as used at the Alliance Insurance Offices, Bartholomew-lane, E.C., produces a most handsome appearance, and is without doubt one of the finest productions of its kind. His four-flock "Calavass" paper is both large



PIER GLASS A LA CHIPPENDALE by Aldam Heaton



DRAWINGROOM TABLE IN MAHOGANY

and handsome, a perfect sunset effect being insured by the apricot tone and pale coral red rendering, which is well suited for a cool drawing-room. The "Ducal Palace" ceiling-paper also attracted our attention; but most of all Mr. Heaton has scored with artistic advantage by introducing clear pigments in wall-paper printing, so that the chalky, dead, heavy colourings common to most other papers is avoided, and he has carried out the same idea in painting woodwork, using no white-lead for the finishing coats of colour. By this means, employing clear colours mixed with varnish, and the stipple brush and comb, a singularly transparent richness is insured, besides a splendid wear-resisting surface devoid of all chalky dulness. Mr. Heaton's poker-work, done by young ladies, is executed with a platinum tool kept red-hot by an ether petroleum bellows, very easily manipulated, and the design is generally burnt into sycamore or bass-wood panels for friezes or fascias, &c. Brass and copper *repoussé* work, by lady artists, is made a great feature of by Mr. Heaton for bowls and dishes, as well as for grilles and panels; and wrought-iron work is included in his undertakings. We give a sketch of a balcony front from his design, and a *repoussé* ventilating panel. On the same sheet is a drawing of a 7ft. brass sanctuary candlestick, lately designed and made by him. His original speciality continues to be his strong point—viz., the weaver's art, and this, coupled with purpose-made carpets and with needlework, has been greatly developed of late years in the way of fabrics for curtains and short running blinds in Taffeta or in natural and coloured Shantung silks. The French "Habillement des Troupes" alone imported by Mr. Heaton, makes grand curtains, in excellent red, and his Yorkshire moreen, made of Russian wool, is a beautiful material. The Kelim Cloth, in imitation of the Oriental, as well as his thick blind "Camlet," are made by Mr. Heaton in Yorkshire. Khiva and genuine Eastern Kelims, and other tent coverings of Oriental make, as well as picturesque "Palampores" from India are much used as edgings and borderings for curtains, with good effect. The accompanying sketches of diverse work sufficiently explain themselves, and the subjects were chosen for their typical character. The old Stewart warming-pan lid sconce shows a disused piece of repoussé put to good purpose. The illustrations of the "Poker work" are photographed direct from two samples, and the wall-panel in Gesso on Singapore matting is from a cartoon, so the texture of the material is not shown on the plate. The stencilled paper ceiling decoration is represented with part of a general design, and the figure-panels to a larger scale in detail.

* * *

THE A.A. CONVERSAZIONE.

THE forty-eighth session of the Architectural Association was inaugurated on Friday evening by a conversazione given at the Queen's Hall, Langham-place, W., and was numerously attended by members and lady visitors. The body of the hall was cleared of seats and rearranged as a drawing-room, lounges being interspersed with screens for the display of various exhibits, while a profusion of flowers and foliage plants added to the brightness of the effect. A reception was held by the President (Mr. E. W. Mountford) and the Committee, and from the orchestra a full programme of vocal and instrumental music was performed by members of the Rebec Orchestral Society, conducted by Mr. W. Horsey, lightness and variety being introduced into the performance by the members of the Pierrot Banjo Team, three in number. On the walls beneath the gallery were hung the students' prize and other drawings executed in the Marlborough-street studio, and a numerous display of architectural photographs by members of the A.A. Camera Club, chiefly mementoes of visits made to Ely, Canterbury, and Croydon; the lion's share was provided by Mr. E. W. M. Wonnacott, but Mr. F. R. Taylor, the hon. secretary to the club, also sent a good many, and among the other contributors of good work was Mr. George Fleetwood. An interesting exhibit of allied character was the photographs taken during the recent A.A. excursion to Wells by the late Mr. John L. Robinson, R.H.A., a special feature being a complete series of 15 photographic groups of each excursion-party, from that to Kettering in 1882 to the present time. These portrait assemblages, ranged in triple line along a wall, attracted much attention, showing the great changes that have gradually come over the *personnel* of the party, and also evidencing a steady improvement, from a technical standpoint, as photographs; but it was not imagined by anyone of those who scanned the groups that the gifted and genial "hon. photographer to the Association" and ex-president of the Camera Club had that evening passed away, and that consequently the series then brought together for the first time was also completed. On one of the screens was hung a number of water-colour drawings made by Mr. R. Phené Spiers, F.S.A., during a recent visit to Rothenburg and neighbourhood, and Mr. J. W. Singer, of Frome, lent a collection of half-a-dozen old processional crosses in brass and copper. Messrs. Jeffrey and Co., of Essex-road, showed a number of wall-papers, designed by Mr. Walter Crane, Mr. Heywood Sumner, and Mr. S. Webb; and other fresh patterns in wall-hangings were exhibited by Messrs. Essex and Co., Messrs. Haywood and Sons, and Messrs. Percy Heffer and Co. Cabinets, mantelpieces, and other decorative furniture were contributed by Messrs. Collinson and Lock, and Messrs. S. J. Waring and Sons, the successors to Messrs. C. Hindley and Sons; while Messrs. Turberville Smith and Co. lent a number of carpets, the Graisland Block Printing Co. showed examples of their work executed on silk, tussore, linen, and cotton-plush, and Messrs. Watts and Co. had on view a selection of specimens of, and photographs from, church metal work and embroidery designed by Mr. G. F. Bodley, A.R.A., Mr. J. L. Davenport, and other artists.

* * *

THE SOCIETY OF PORTRAIT-PAINTERS.

THE fourth exhibition of this society, on view at the New Gallery, Regent-street, contains a fairly representative collection of portraits by well-known living painters in this branch. In style and treatment the visitor will notice much diversity. He will see the carefully-painted conventional portrait, treated after the best traditions of Reynolds and Gainsborough; the semi-dramatic or theatrical presentment, in which action is represented; the allegorical, the naturalistic, and impressionist manners. Several important portraits are sent by J. J. Shannon, as those of Mr. Hoffman; the late "Henry Vigne, Esq., Master of the Epping Harriers" (35), in the West Room; "Mrs. Creelman" (58), a charmingly-painted study of a lady possessing nice features upon a broken tapestry-like background; the wife of the painter (87), an effective study in the drawing and colour, the lady in large hat relieved by a green background, in the North Room; a characteristic portrait of "Signor Rosetti" (116) and one of "Mrs. Burnet" (112), a pretty face, with bright eyes, in a low-cut silk dress trimmed with pink, a seated and graceful study, in the South Room. The latter picture is full of expression, and delicate in the handling. The "Earl of Radnor" (99) is another portrait. Percy Bigland contributes four subjects, all of interest. His standing figure, "Imrati" (5), in light-green drapery, is a graceful study of a lady, and the portrait of "R. D. M. Littler, C.B., Q.C." (89) a carefully-painted subject. G. F. Watts, R.A., has also four pictures. No. 7, "Mrs. Percy Wyndham," is a full-length portrait of that lady, represented against a balustrade backed by foliage, strong in colour and not lacking in dignity and grace. "Miss Fenwick" (105), "Sir Henry Taylor" (110), and "Mrs. Cameron" (145), in the South Room, are also good examples of this master's work, boldly handled and massive in tone. In the West Room, Mouat Loudan, a rising painter of children, of considerable power, has a clever portrait study (9) of a young lady in browns of a neutral shade, and a very pleasing child-study, "Celia" (32)—a little girl in white frock, with expressive blue eyes looking straight out of the picture, simple and childlike. In the West Room also is a large picture, "Portrait of Mrs. William Duncombe" (20), by A. Stuart W. Wortley, a lady in rich plum-coloured velvet, partly kneeling against the back of an arm-chair by the side of a grand piano, her music-books lying on the floor. Mr. Wortley has painted his subject with a certain dramatic power; the deep tones of the velvet dress and the surrounding adjuncts are in strict harmony and depth of tone. His portrait of "Mrs. Cayley" (34) is another clever study in brown. In the North Room are two other portraits of ladies by the same hand. A very graceful standing, full-length figure is H. J. Hudson's "The Hon. Mrs. Alex. Stewart" (23), who is represented standing before a palm. This picture, in its delicacy and grace of tone, contrasts strongly with the next subject, the Hon. John Collier's portrait of a stout lady, seated, in light-grey silk dress, knitting, with a screen background. E. A. Walton's portrait of his wife is a noticeable contribution. It is rather a subject-study in tones than one of simple portraiture; the lady, a trim, small-featured woman, sits at the end of a couch, dressed in black—a quaint-like treatment. The background is grey. "Lady Gorell Barnes," by W. Llewellyn, in green velvet, is a stately figure. John Lavery has a full-length portrait of "Mrs. Fitzroy Bell" (27), and the contribution of J. H. Lorimer (28), a child in yellow and brown, is quaint and demure. The portrait of "Herman Herkomer," a youth, by Professor H. Herkomer, R.A., is worth notice for its solidity and strength, and for the carved frame which contains it. Bastien Lepage's "Mrs. Lebégne" (30) is remarkable as a specimen of the portraiture of this great French naturalist. It is a full-length study of the lady in white satin quilted underskirt, with a deep-blue robe, and is a stately figure, painted with much detail. "Miss Bertha Clay" (37), by Miss Lily Delissa Joseph, has a weird look; the wan, pale face of the young lady, with the blue figured cloak, and the woodland background take it out of the commonplace, at least. The reclining full-length portrait of "Miss Brenda Pattinson" (41), by the Hon. John Collier, is gracefully drawn; the lady's dress is a rich mauve, contrasted by a background of green wall-paper, and produces a pleasing colour harmony.

One of the most beautiful and subtle canvases in the South Room is A. Gandara's "The Princesse Chimay," which was exhibited in the Paris Salon, where it was much admired. The figure of the Princess is tall and graceful in pose; she is shown full-length standing in a dress of white satin, her face turned away in profile—a queenly figure, her auburn hair bright and rich. This fine figure, in the charming delicate satin robe of the high-waist type, is set off upon a background of purply-brown, and the painter has lavished his skill upon the refined draperies and modelling. The chief beauty of the subject is the simple lines of the flowing dress and the charm of the attire. Professor Herkomer's large and powerful canvas, too large for the merits of the subject, represents that chaming danseuse "Miss Letty Lind" in her "serpentine" dance. The whirl of skirts in rainbow colours is full of movement. Solomon J. Solomon (119) sends a very delicately toned study of "Miss Edith Cirola Loder," a dark-featured lady, set off by a primrose background. John Sargent, A.R.A., T. Graham, R. Lehmann, Mrs. Louise Jopling, Mrs. Swynnerton, and Fred Sandys contribute other clever studies of portraiture, and Prince Troubetzkoi sends the "Home Rule" Portrait of Mr. Gladstone from Downing-street sittings. The copy of the Home Rule Bill with the ex-Premier's autograph is inclosed in the frame.

CHURCH ARCHITECTURE AND DECORATION.

At the closing meeting of the Church Congress at Exeter, on Friday, an address on this subject was given by Mr. W. B. Richmond, A.R.A. It was tempting, he said, in these days, which were full of puerile as well as offensive novelties, all products or signs of decadence, to fold one's hands and watch the progress of events, and to become more and more conservative lest by chance any statement or critisism might place one within the ranks of progressive prigs. It was dangerous to allude to progress without being misunderstood to mean change. Art was a subject worthy of the consideration of these meetings, because while it had been a dependant of the Church it was once one of its buttresses. Though it was not to be apprehended that any one of his audience desired our sacred edifices to be decorated by the newest inherited ideals, it was to be presumed that they all wanted an improvement in the present state of ecclesiastical art. Nor could any cultivated audience think that our senate would be enriched or our pulpits adorned by that ridiculous, preposterous species the new woman. That would be progress towards chaos. They would like to preserve true methods of work and to weaken the strictly commercial spirit by which religious art was environed. Churches were the palaces of an invisible King, into which had flowed so affluently the highest achievements of man's creative powers. When the Church was in active union with art of all kinds those palaces of the King could be of two kinds—noble by their grave austerity, as the caves of the anchorites or the cell of St. Francis, or resplendent with silver and jewels, mosaic and marble, as the shrine of St. Mark's upon the shores of the Adriatic. There was, however, a medium below these which could not be desired—a shoddy concern, and the art by which it was maintained was of that character. Indifferently theatrical and quite ephemeral, there was a plethora of it grown as well as growing. This was a result of ignorance prompting a desire for trash, and a sign of vulgarity which demanded ornament under all circumstances. It also demonstrated a want of discrimination, so characteristic of a class which longed for "Brummagem," and adorned itself with sham jewelry and artificial flowers. The evidences of its existence were shown in a great deal of modern art, and it had crept already into ecclesiastical structures and their appointments. A commercially-turned-out reredos was erected, of a well-known pattern, bearing considerable resemblance to a Twelfth Night cake, inlaid, perhaps, with a little sugar-plum mosaic, rivalling by its tinsel brilliancy the Christmas cracker. May be some ill-carved and commonplace saints occupied niches, or an oil picture, the copy of an old master, resembling an oleograph, might depress still more the monotony and dulness of the whole design. The stained-glass window was a great fetish of the pious world, and there was a great trade for that commodity. It was of two kinds—the trade and the art window; but granting that there were a few notable exceptions, the one was pretty nearly as valueless as the other. Hundreds of both were turned out every year with machine-like precision and rapidity. In the place of robust design full of meaning and such manly work as the 12th, 13th, 14th, 15th, and even the 16th-century artists made, we were asked now to accept mawkish sentiment, weak or pretty saints, who, if they were like their portraits, would have flinched from the gridiron and become hysterical in the Roman amphitheatre. The sacred central figure of Christianity was too often misrepresented as a characterless, weak man, to whom no one would go for advice, much less worship. Let a man go to Chartres, Assissi, Santa Maria Novella, York, Tewkesbury, Rome, Verona, Oviedo, Wells, Venice, Lincoln, Exeter, and try to persuade himself that the work was designed by architects and carried out by the trade, and they would fail to be so persuaded. Or let them go on to some homely English churches before the parson and the tradesman-architect had had the temerity to pull them about and shear every particle of vitality off them. If they had lived in those days of intense life and feeling they would have seen the architect, or the master-workman—that was his proper name—employed on the building in common with his assistants, the sculptor, in reality the mason, busy revealing the treasures of his imagination, making the stones live under him, the window painters marking out lines of life and character, the painters painting their dreams directly on the walls like men. The causes of the change were manifold. Puritanical dread of idol worship had dismissed the painter and image-maker, and the opening of churches on Sunday only had rendered it useless to make them beautiful. But the forces of centralisation had narrowed the sphere of art as of religion. Painters had filled exhibitions and neglected churches. In place of sculptors were third-class carvers employed to execute from the architect's feeble reflections of Continental visits. Superficially stated, the remedies were simple—to desire the best, to know the best, to spend no money but on the best. The middle-man must be a thing of the past. The Church authorities must get into immediate and candid relation with the artists, whoever that might be. The architect, painter, and sculptor must be satisfied with moderate gains, leaving the idea of seeking a fortune to the members of the Stock Exchange, and they would be in part paid by the happiness of doing healthy work. Thus we should regain something of what we had lost. In place of feeble decoration we should have virile work. The Church would gather once more the sympathy of real artists, and she would thereby be strengthened, broadened, humanised, as well as refined.

NOTES FROM EDINBURGH.

Probably there are few large towns for which less is needed and more done in the way of providing recreation grounds than the City of Edinburgh. At all points the most central parts are within easy walking distance of urban parks or gardens, or hill scenery or country roads, and unquestionably a great deal has been done, especially in later years, to make the city healthy by bringing the advantages of country life to counteract the disadvantages of the town—with what result it is perhaps rather early to say, except that the ratio of annual mortality is always more or less decreasing. Improvement schemes have been reducing the overcrowded areas, and the drainage of the city may be considered as perfect as the condition of the public sewers and registered sanitary plumbers can make it. The Water of Leith drainage scheme is now completed, and the river flows nearly, if not quite, as free from sensible pollution as it ever did. Trout have been introduced into its lower reaches, and hopes are entertained of its becoming one of the most attractive features in the city landscape, with finely-wooded banks and a crystal stream. The weekly mortality this year has been as low as 10 per 1,000, though for one week it reached the high figure of 26, when an epidemic of smallpox was prevalent for a short period. This was the normal mortality 30 years ago, without symptoms of abating, when the population was a little under 170,000. At present, with a population of about 262,000, the normal rate of mortality is 18 per 1,000, with symptoms of decreasing. This is the evident result of several improvement schemes and greater attention to sanitary matters, and has been obtained at cost of a very large expenditure, probably about two millions. That large outlay, however, has been made without much increase in the public burdens, the rateable annual value being just about double what it was 30 years ago.

In connection with the present, which is the third of the series of great improvement schemes, instituted since the early years of the century, a beginning has been made in demolishing the high tenements forming one side of Bristo-street, opening up to view the new University hall in a way that shows its proportions and details to great advantage, besides converting a narrow thoroughfare into an open place, which will by-and-by be made ornamental to the city. For the more densely-populated district of Old Edinburgh, a scheme has been formally laid before the council for providing better housing for the working classes. Indeed, as things appear to be tending, Old Edinburgh, with its closes and pends and back courts, will soon be numbered with the things that have been, and exist only in the sketches of popular artists. Hitherto the method has been uniform. One or more closes back from the main street—i.e., the High-street, have been thrown into one, and more air and better light secured for a smaller or larger open square. The Cockburn-street improvement scheme was not intended for more than a better access to the railway centre, and the Jeffrey-street is in the same category. The improvement scheme of 1826 was similar, but all of these opened up the countless narrow lanes or closes to the light and air, and probably did more for their better ventilation than the system of making confused but larger open courts behind the main buildings of the principal thoroughfares. Long before sanitary matters were held to be important, and before the New Town provided attractions for the exodus of citizens of the wealthier class, Milner-court and James-court were built on speculation, and remain to this day. The scheme now before the council proposes to deal in similar fashion with the much larger area between the iron church and the Fishmarket-close, to the south of the High-street, and down the slope to the Cowgate. The plan proposed differs from previous schemes, inasmuch as it seeks to provide accommodation for a certain class of tenants, and draw the rental for the city's good, as well as the benefit of poorer tenants, who can afford to pay for a single room or a two-roomed house. The scheme has been subjected to slight discussion as yet, and at first sight appears to be objectionable, as providing for too large a number of tenants in large tenements—in fact, perpetuating the system of overcrowding occupants within limits not consistent with approved sanitary requirements, excluding far too much the light and air essential to city life. Of course, it would be possible, on such a good southern exposure as to site, to build healthy houses of two floors; but this arrangement is one that could not pay, and in all likelihood the plan will have to be abandoned, and the improvement take some other line of operation. At present the population of the area is extremely dense, and it is hardly worth while incurring an expenditure of £30,000 for making the change into larger but little better ventilated courts.

The council, which has taken the electric lighting into its own hands, has now completed the work of laying the cables, &c., in the principal thoroughfares of the New Town, and where it may be taken advantage of by those who can afford to use it. It has, however, a powerful rival in the incandescent gas-burner, which provides a very brilliant light at a very small consumption of gas. Nicolson-square has been lighted with these burners, and the installation is considered a success. The mantle, or burning apparatus, has been in some way recently improved, and smaller apartments can be lighted with burners, consuming only 1½c.ft. of gas per hour.

The question of additional water supply is in a fair way to be settled. After a great expenditure, without satisfactory results, in trial borings for reservoir for the Talla water, the advocates of St. Mary's Loch appear tc have been convinced that the scheme is impracticable on the score of the probable cost, both in execution and for compensation of proprietors. The Report of the Water Commission has therefore recommended the Tweed and tributaries supply as the most economical, and as providing better water. The inclusion of the Moorfoot Hills supply, by the last scheme, has not improved the city water, as it contains a very large percentage of vegetable impurities. To this cause is ascribed the frequent and rapid destruction of boilers, which become useless by the chemical action making many minute holes in the iron.

The plans for a new North Bridge are now being estimated, the piers to be constructed of sandstone and brick. Granite, it appears, can be brought in large blocks to Leith, axed or dressed, for 3s. per cube foot from Norway or Swedish quarries, or more cheaply than from Aberdeen, and in a structure requiring strength, it is the most likely material to make what should be an imperishable structure. The piers of the present bridge are said to be as sound as when built, and it is said that granite is not insensible to the chemical disintegration of a very smoky atmosphere, which Edinburgh somehow has had the credit of possessing.

BOOKS RECEIVED.

Specifications: for the Use of Surveyors, Architects, Builders, &c. By J. Leaning, F.S.I., &c. (London: Sampson Low, Marston, and Co., Ltd.)—Mr. J. Leaning, the author of "Quantity Surveying," well known as a textbook, has done useful service in republishing in book form the "Notes on Specifications" which appeared in these columns in 1893. The notes have been amplified, and made more comprehensive. The author's experience as a quantity surveyor has led him to make several suggestions of value in dealing with the several trades, and it is mainly from this point of view that the book has been written. The preliminary remarks are worth reading by all students and architects, as, for instance, as to the maintenance of the same order in all descriptions of similar things, in the use of good expressive words, and the writing of an entirely separate specification in all trades of a particular building like a conservatory, a stable, &c. The trades are dealt with in due order, and the sequence of the items and points to be observed are shown under various heads; useless model specifications are avoided, but the specimen clauses will be found of value. Mr. Leaning's work is one of the best guides to specification writing we have seen.——*American Plumbing*, by Alfred Revill, illustrated (London: The International News Company, Bream's-buildings, Chancery-lane), is a complete handbook of practical plumbing, from solder-making to high-class work. The work is well illustrated by diagrams and appliances of approved types, and the remarks on lead, solder-making, plumbing tools, joints, bends, traps, soil-pipes, closets, kitchen boilers, &c., show a practical insight. The plumbing regulations of New York are appended.——*The Practical Engineer Pocket-book and Diary*, 1895, edited by W. H. Fowler, Wh.Sci., M.Inst.M.E., &c. (John Heywood, Manchester, and Amen-corner, London), is a well-known, compact pocket-book that has been revised and enlarged. It is full of data, tables, and formulæ on every branch of mechanical engineering, and is fully illustrated. It is handsomely bound in roan, gilt edges, 1s. 6d. ——*Transactions* of the American Society of Civil Engineers for August contains several papers. "Friction Rollers" is treated by Messrs. C. J. Randall, member, and A. Marston, associate; "The Quality of Water Supplies," the "Tequixquiac Tunnel, Valley of Mexico," the "Sandrock Sewers of St. Paul, Minn.," the "Niagara Gorge," &c., with discussions.——*A History of Lancashire*, by Lieut.-Col. Henry Fishwick, F.S.A. (London: Elliot Stock, Paternoster-row), is another volume of the "Popular County Histories" published by Mr. Elliot Stock. As in the former histories we have noticed, eight of which are published, the author begins his sketch with pre-Roman Lancashire, the Roman Occupation, Roman Remains, and then proceeds to treat of the Saxon and the Dane, the Normans and Plantagenets (1066-1485), the Tudors (1485-1603), the Seventeenth Century, the Rebellion, the Eighteenth century, &c. Many interesting incidents are told, and facts are given touching the social changes and religious persecutions in this country. In Lancashire the feeling in favour of the old form of religion was very strong for a long time after the Reformation, and we read of some rather disreputable things done by the Reformed Lancashire clergy, who were foremost in their complaints against the old fasts and festivals. As a county history, Col. Fishwick's volume will be found a valuable addition to our topographical literature.

The memorial stone of St. Stephen's Presbyterian Church, Craigie, near Perth, was laid on Saturday. The plan is that of a Latin cross, with nave, aisles, transepts, and chancel, and having a tower and spire at the south-west angle over the main entrance doorway. In the mean time the transepts and tower are not to be built. Externally the architectural treatment is of the simplest character, with detail of the Early Gothic period. The estimated cost of the building is £3,500.

Operations in connection with the sewering of the borough of Stafford have already been begun by the contractor, Mr. Enoch Tempest, who is about to erect some powerful pumping machinery at the depot, with the object of draining the borough and lowering, as far as possible, the subsoil water, in order to facilitate the sewering of the Backwalls section of the work. For this purpose, sumps will be dug in various parts of the town as a preliminary step to this undertaking, and one boring has already been commenced in Eastgate-street.

The extensive Roman Catholic buildings which Father Beauclerc has been erecting at Holywell, in close proximity to St. Winefride's Well, will be ready for use on the occasion of the Feast of St. Winefride, on Sunday, the 4th prox. The large schoolroom has a total length of 75ft., is 50ft. in width and 30ft. in height, and is provided with a stage. In front will be erected a marble statue of St. Winefride, which is now being sculptured at a cost of £200. The total cost of the buildings and fittings will be about £2,000.

ARCHÆOLOGICAL.

Babylonian Antiquities and the Turkish Government.—A correspondent of the *Times* states that since the lapse of Mr. Rassam's exceptional privileges, obtained for him by the late Sir Henry Layard, which enabled him to send to the British Museum everything he found in Assyria, Babylonia, and Armenia, the Porte has persistently refused to allow the agents of foreign museums to appropriate or export any antiquities out of Turkey. Whatever is found in the excavations or obtained by purchase by such agents is taken possession of by the Turkish Government. Under these rules no fewer than 47 cases of antiquities from the American diggings and about 12,000 inscribed clay tablets of those of the French, discovered by M. Sarzac at Tel-Loh, have been appropriated and sent to Constantinople. At Sippara, or Sepharvaim (the site which was discovered by Mr. Rassam about 14 years ago), the Ottoman authorities have been carrying on lately extensive operations under the superintendence of a Latin priest. At that place a large collection of inscribed clay tablets have been found and despatched to the Turkish capital. It is believed that there must be at the present time no fewer than 50,000 newly-discovered inscribed objects at the Imperial Ottoman Museum in Constantinople, obtained from different Babylonian sites, which might add materially to the existing knowledge of the ancient history of Chaldea and Assyria. Two black basalt statues, covered with fine inscription, have lately been found by the Arabs; one at Imjaileeba, the site of the great palace of the kings of Babylon, and the other in a cave near Nimroud, on the opposite side of the Tigris, about 20 miles to the south of Mossul. These images have also been sent to Constantinople. The greatest find by Arab diggers of inscribed objects that has come to light lately was at Tel-Loh, after M. Sarzac, the French agent, left. They discovered a large chamber full of inscribed clay tablets, most of which they sold to Armenian, Syrian, and Jewish brokers for exportation to England, France, Germany, and America. Parts of the collection have already reached London and Paris, but the remainder has been seized by the Ottoman authorities at Bagdad.

CHIPS.

The master painters and decorators of the United Kingdom will hold a national convention in Manchester, on Tuesday next, Oct. 23, and following days. The object is to raise the status of the business by the founding of an institute. The proceedings include a trip to the Duke of Westminster's place at Eaton.

No fewer than 576 architects have entered the competition for the preparation of plans for the projected Paris Exhibition of 1900.

During the last two months the Highbury-quadrant Church has been closed for extensive alterations, which are now complete. The church, as now enlarged by the addition of side galleries, is one of the most spacious Nonconformist churches in London, the seating accommodation being for nearly 1,600. The organ has also been improved by the addition of new stops.

A project is on foot by which the waters of the river Kent shall be applied to the purposes of a new railway in the Lake district. It is proposed to construct an electric tram line from the Furness district to Bowness, with an auxiliary undertaking eventually carrying it on to Ambleside. A meeting has been held at Cartmel with reference to the scheme, and water rights have already been secured in order that the electric current may be generated from turbine power.

The principal door to Christ Church, Broad-street, Bristol, has just been reconstructed from the designs by Mr. Henry Wilkins, of that city, by whom the church was restored ten years since. Messrs. R. Wilkins and Sons, of Bristol, were the builders, and the carving was executed by Mr. William Smith, of Montpelier.

The boat-house of the Clifton Rowing Club, below Saltford Weir, on the Avon, which was burnt out three months ago, has just been rebuilt from designs by Mr. Frank Morris, of Bristol, in a half-timbered style. Mr. Hendy, of Kingsdown, was the contractor.

The electric railway to Snowdon is beginning to take shape. A company has been registered with a capital of £6,000 in 600 shares of £10 each, to construct a railway from Llanberis, Carnarvon, to a point near the summit of Snowdon, and to erect and carry on an hotel at or near the summit. The subscribers include F. W. Holme, Crosshall-street, Liverpool, architect, and G. Nicholson, 24, North John-street, Liverpool, contractor.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

A.A. Camera Club.—At the general meeting of the A.A. Camera Club, held on Oct. 1, 1894, Mr. George Fleetwood, F.S.I., was unanimously elected as president. The other officers and committee elected were:—Mr. E. W. M. Wonnacott, A.R.I.B.A., vice-president; Messrs. T. H. Bishop, J. P. Clark, C. H. Freeman, and R. Elsey Smith, A.R.I.B.A., committeemen; and Mr. Francis R. Taylor, hon. secretary. At this meeting the methods to be adopted by the A.A. Postal Print Exchange Club were discussed, and the first portfolio of architectural photograms was put into circulation. On Oct. 12 several photograms and lantern-slides by members of the club were exhibited at the A.A. conversazione.

Sheffield Society of Architects and Surveyors.—The members of this society held their annual conversazione at the Cutlers' Hall, Sheffield, on Thursday evening in last week, when a distinguished company of between 300 and 400 guests assembled, and witnessed the presentation of prizes to the successful students. The visitors were received by Mr. E. M. Gibbs, the president; Mr. C. Hadfield, vice-president; Mr. F. Fowler, treasurer; and Mr. C. J. Innocent, the hon. secretary. In a brief address, Mr. Gibbs, on behalf of the council and members of the society, heartily welcomed the visitors. Having referred to the exhibition of sketches and measured drawings of ancient buildings in the district, executed during the summer months by the younger associates and students of the society, Mr. Gibbs explained that the work of the society was largely educational. They carried on their work in the form of lectures and discussions on special subjects, and the formation of a library for the benefit of all the members, and in the form of classes on the study of the history and styles of architecture, sketching, designing, and surveying and levelling for the benefit of the younger members. The society was also active in matters relating to professional practice, and desired, whilst protecting the interests of the profession, to command the respect of the general public by maintaining the honour of its members and the standard of their ability to solve successfully the complex problems of modern building and surveying by combining the most perfect arrangements of plan, the best construction, and the most artistic conception and finish, with the soundest advice as to values and cost and the practical superintendence of the work. The first prize of the sketching class was awarded to Mr. Frank W. Chapman for sketches and measured drawings of parts of the churches of Ecclesfield, Whitwell, Beauchief Abbey, South Anston, and Laughton-en-le-Morthen, and other places in the neighbourhood; and the second prize to Mr. J. C. Amory Teather for drawings of the same buildings. At the close of the distribution, the guests inspected the collection of pictures of the Sheffield Society of Artists, which were on view in the drawing-room and reception-room, and afterwards listened to a musical programme rendered by Messrs. R. C. Poole, J. Mack Clark, Charles Stokes, A. Riden, R. C. Honey, William Brown, and T. A. Macaulay.

At the annual meeting of the Governors of St. Mary's Hospital, Manchester, on Monday, it was announced that the trustees of the David Lewis Fund had made a grant of £70,000, under certain conditions, which involve amalgamation with the Manchester Southern Hospital. The scheme proposed by the trust involves the building of two additional hospitals.

The new coroner's court which the Battersea Vestry have provided in Apthorpe-grove, Bride-road West, Battersea, was opened on Monday. The premises were formerly used as the offices of the surveyor to the Battersea Vestry, who has now been provided with more suitable quarters in the new Town Hall, Lavender-hill (built from Mr. E. W. Montford's designs), where all the municipal offices are now situated.

Major-General H. D. Crozier, R.E., one of the inspectors of the Local Government Board, held an inquiry on Friday at Stoke-on-Trent with respect to an application by the town council for sanction to borrow £1,500 for the purpose of public street improvements. The town clerk explained that the loan was required for the work of paving footpaths and kerbing and channelling in various parts of the borough. The borough surveyor (Mr. W. Bowen) submitted plans and estimates of the proposed works, which he explained in detail. The application was unopposed.

Engineering Notes.

Improvements in the Danube.—Mr. Percy Sanderson, British Consul-General for Roumania, reports on the improvements made in the navigation of the Lower Danube during the years 1878 to 1893 inclusive. The engineering works, which have been carried out under the superintendence of Sir Charles A. Hartley, K.C.M.G., chief engineer to the Danube Commission, are classed under three heads, viz., those on the Black Sea coast-line, those in the port of Sulina, and those in the river. The approaches to the port have been made safe by beacons, as well as by fog signals and a whistling buoy, and the south pier at Sulina has been prolonged considerably. An even depth of $20\frac{1}{2}$ft. has been maintained at the mouth of the river, and will be increased to $23\frac{1}{2}$ft. by the completion next year of parallel dams. A minimum depth of 15ft. has been obtained on the whole of the Sulina branch, while the course of the river has been shortened by six nautical miles.

Leeds.—Extensive improvements, estimated to cost £90,000, are in progress at the North Eastern new station. The area of the platforms and roofs will be doubled, and five new lines of railway provided in and about the station. The river and an offshoot of the Leeds and Liverpool Canal have to be crossed. Two new lines from the east end of the station to Call-lane are in process of construction for goods traffic. In the station itself, the main platform at the western or Holbeck end is to be lengthened 370ft., and the roof at this end will be continued another 180ft. Over the river Aire the brick archway is being extended. The east end of the station is also to be considerably enlarged. The main platform will be made much wider, and its present length increased by over 300ft., while the roof at this end will be made 280ft. longer. On the Boar-lane side of the station two new lines are in process of construction, for Scarborough and Bridlington passengers. New Station-road will be diverted and carried across in the direction of the Midland station. A new parcels office in Neville-street, north of the station, is part of the project, and also station offices in Neville-street, five stories high. The railway contractors are Messrs. Naylor Brothers, for whom Mr. Parkin is acting as superintendent engineer. For the railway company, Mr. Copperthwaite is the engineer; Mr. W. D. Rudyard, of York, being the resident engineer to superintend the practical engineering work. Mr. Green is the brickwork inspector.

Spalding.—A new bridge for the Midland and Great Northern Railway Companies, built by Messrs. Handyside and Co., of Derby and London, was on Sunday placed in position over the river Welland, at Spalding. The structure is of three steel lattice-bar girders, with a total span of about 110ft., and carries a double set of rails. It was removed from its temporary position where it had been erected into its permanent one in five minutes on Sunday. The old bridge was lifted by hydraulic jacks and moved bodily away in seven minutes. The new structure, which weighs over 200 tons, was afterwards tested by two fully-loaded engines, each weighing about 80 tons. The bridge was designed by Mr. Richard Johnson (a native of Spalding), the chief engineer of the Great Northern Railway Company, and the work was carried out under the supervision of Mr. C. A. Kirby, M.I.C.E., of Boston, the company's resident engineer for Lincolnshire.

Telpher Railway at the Devil's Dyke.—On Saturday a Telpher railway across the Devil's Dyke on the Sussex Downs was opened by the Mayor of Brighton. The track cables of the railway are carried upon a series of supports attached to a catenary cable, secured to the sides of the gorge, the structure being steadied and further strengthened by iron columns at about 200ft. from the extremities of the railway. The main cable is 1,200ft. in length, the space between the two stations about 1,100ft., while the span between the columns is 650ft. The cars are conveyed at a height of about 230ft. above the lowest point of the gorge, and are moved by an endless cable worked by a Crossley's patent $4\frac{1}{2}$H.P. oil-engine. Mr. W. J. Brewer, C.E., was the engineer, and Messrs. E. Scott Russell and Molesworth the consulting engineers, while the contract has been carried out by Messrs. Heenan and Froude, who are also erecting the Wembley Park Tower.

The Simplon Tunnel.—The Swiss Federal Council has approved in principle the project of the Jura-Simplon Railway for cutting a tunnel through the Simplon, and the contracting firms—Messrs. Brand, Brandau, and Co., of Hamburg, Sulzer Brothers, of Winterthur, and the Bank of Winterthur—have undertaken to carry out the works. The company contracts to complete the tunnel within five and a half years from the commencement of the works, and to throw it open for traffic with one track by that time. At the same time a lateral gallery is to be driven for a second tunnel and a second track. The Jura-Simplon Railway, on its part, undertakes to pay the contractors £280,000 for preparations; £1,900,000 for making the first tunnel with one track and a widening at its highest point for a crossing, as well as for the gallery of the second tunnel and cross-galleries; and £600,000 for the construction of the second tunnel, if built. The railway company has to decide within four years whether this second tunnel is to be made.

The Wrexham and Ellesmere and Wirral Railways.—During the week the directors have inspected the works of the Wrexham and Ellesmere Railway, which will be ready for opening in the course of a few months. The railway commences by a junction at Wrexham with the Wrexham, Mold, and Connah's Quay Railway, and terminates by a junction with the Cambrian Railways, near Ellesmere Station. At Wrexham a joint station will be erected. The line will be about $12\frac{1}{2}$ miles in length. The directors of the Wirral Railway have also made a tour of inspection over the works of the Wirral line, which are now in course of construction. The new railway, which will be about 14 miles in length, commences by a junction with the Manchester, Sheffield, and Lincolnshire Railway, on the north side of the Hawarden Swing Bridge, and will terminate with the Hoylake line at Bidston. The line will shorten the distance between Liverpool, Birkenhead, and North Wales very considerably; for instance, the distance from Liverpool to Connah's Quay by the existing route is $35\frac{1}{2}$ miles, and by the new line $15\frac{1}{2}$ miles, or a saving of 20 miles. These two railways, the Wirral and the Wrexham and Ellesmere, are the only remaining links necessary for the completion of the through route sanctioned by the Welsh Railways Through Traffic Act, 1889. The Wirral Line will be ready for opening next year.

CHIPS.

A disastrous fire, in the course of which the church of St. Simon and St. Jude, Granby-row, was partially destroyed, as well as the packing-case works of Messrs. Roebuck, occurred in Manchester on Friday morning.

By a bare majority (22 votes to 21) the London School Board decided, at their last meeting, to reckon in future the accommodation of new infants' schools on a basis of 9sq.ft. per scholar, instead of 8sq.ft., as at present.

The ceremony of stone-laying in connection with a Primitive Methodist Chapel in Station-street, Ashbourn, took place on Wednesday week. Mr. Henry Harper, of Nottingham, is the architect, and the contract, for £1,465, has been let to Mr. Vickers, of the same place. The new building is to accommodate 400 persons.

A new church in Roundhay-road, Leeds, erected as a memorial to the late Dr. Woodford, Bishop of Ely (formerly vicar of Leeds), and dedicated to St. Aidan, was on Saturday consecrated by the Bishop of Richmond. The edifice, situated in a populous and rapidly growing suburb, is a red brick structure in the Roman Basilica style of architecture, and has accommodation for 1,000 worshippers. It has cost about £15,000.

The local board of New Swindon have adopted plans by Mr. J. E. Marsh, of Bath, for a bridge over the Wilts and Berks Canal and Regent-street.

Sir George Verdon has purchased for the Melbourne Art Gallery David Roberts's picture of the "Interior of St. Anne's Church at Bruges," the price paid being £525.

The foundation stone of a new church at Clydach Vale, a populous mining district in the Rhondda, was laid on Tuesday week. The church, which will be dedicated to St. Thomas, will cost about £3,000. There will be accommodation for 450, with a schoolroom underneath for 300 children. The architect is Mr. E. M. Bruce-Vaughan, Cardiff, and the contractors are Messrs. Hatherley and Carr, of Bristol.

PUBLIC OFFICES AND PUBLIC LIBRARY AT BARKING.—ASTON HALL.—DECORATIVE WORKS, BY MR. J. ALDAM HEATON.—STAIRCASE IN HOUSE AT BERLIN.—HOUSE AT WOODLEY, CHESHIRE.

Our Illustrations.

NEW PUBLIC BUILDINGS, BARKING.

This block of public buildings, which was opened yesterday by Mr. J. Passmore Edwards, has been recently erected in East-street, Barking, by the local board for the purpose of public offices, public library, and technical rooms. The building consists of a central block with a wing on either side. The ground and first floors of the wing to the left of the building will form the lending library and reading-room respectively. The basement floor of this wing and the rooms formed in the roof over the whole building will constitute the technical classrooms; the remainder of the building will form the local board offices. The fronts of the building are faced with pressed red bricks relieved with Monk's Park stone; the roof is covered with Westmoreland green slates, and surmounted with a turret containing a striking clock with illuminated dials. A wide, open area surrounds the front and one end, admitting ample light and air to the basement floor. The stone mullion windows are glazed with plate-glass below the transoms, and leaded lights of antique glass in geometrical patterns above same. The staircases throughout are of concrete; the floors of entrance hall, corridors, and landings are of fireproof construction and paved with marble mosaic, the walls of which are lined to a height of 6ft. with embossed glazed tiles to form dado. The accommodation provided for the local board offices is as follows:—Basement floor: drawing office, strong room, and caretaker's apartments; ground floor: general offices, clerk's, surveyor's, nuisance inspector, and collectors' offices; first floor: board, committeee, and rate rooms. The building generally has been arranged for a large public hall to be built at the back, a space being reserved for this purpose. Other buildings on the same site have also been erected by the local board, consisting of fire station, public mortuary, stables, cart-sheds, and foreman's house. The contract price for the whole of the buildings is £12,738. The contractors are Messrs. Kirk and Randall, of Woolwich, and the architect Mr. C. J. Dawson, F.R.I.B.A., surveyor to the board.

ASTON HALL.

The illustration, which will be found amongst this week's plates, is a reproduction from a wash drawing by Mr. Ernest C. Bewlay. It was submitted by him in our competition for the "Picturesque Rendering of Architectural Subjects," and obtained a consolation prize. Aston Hall is situated in the parish of Aston, a suburb of Birmingham. Sir Thos. Holt, whose family had long dwelt in this parish, inclosed the park, and began to build the present hall in 1618; it was completed in 1635. Dugdale, who saw it when new, speaks of it as "a noble fabric, which for beauty and state much exceeded any in those parts." It underwent a three-days' siege by the Commonwealth forces, and suffered to some extent, the marks of many of the cannon-shot being still very evident. The arcade shown in the illustration is at the N.W. angle, and was added shortly after the completion of the main structure. The hall became the property of the Birmingham Corporation in 1864, and is now used as a museum. We published a general view of the front in the Building News for Sept. 27, 1889, in which number a more detailed description may be found.

MR. ALDAM HEATON'S ATELIER.

(Further illustrations accompany the descriptive article on pp. 529-531.)

STAIRCASE IN HOUSE, XXV. KURFUERSTENDAMM, BERLIN.

An exceedingly comprehensive collection of detail drawings, with plans, elevations, and sections, in illustration of the internal treatment of houses, commercial premises, and public buildings in Germany, has just been completed, under the direction of Messrs. Cremer and Wolffenstein, by Mr. Ernst Wasmuth, the well-known architectural publisher, of Markgrafenstrasse, Berlin. The title of this practical work, which is issued in a series of folios containing 200 plates, is "Der Innere Ausbau Sammlung Ausgeführter Arbeiten aus Allen Zweigen des Baugewerbes," which indicates pretty clearly the character of the book. We cannot do better than exhibit exactly the style of work represented within its pages by reproducing, to rather a reduced scale, one of the plates, which we have chosen because of its suggestive design, besides on account of the typical methods which the drawing so well illustrates. Its subject is a staircase, carried out by Messrs. H. and A. Mittag, the builders, of a private house, No. 25, Kurfuerstendamm, Berlin, which they erected, with others, from the plans of Mr. Alfred Messel, architect, whose work bears investigation, both for its originality and suitability of scale. Among so many varied and multifarious an assemblage of working drawings illustrative of modern German architecture, there, of course, is much which scarcely commands admiration from English taste, though few can fail to gather ideas of value from most of the designs thus brought together in so attractive a form and to so ample a size, showing how thoroughly the work is executed as well as carefully conceived. All kinds of internal fitments are shown from hotels, restaurants, theatres, business showrooms, libraries, salons, and private dwellings. Plasterwork, metal-work, joinery in ceilings, chimney-pieces, doors, windows, and panellings, glazings and painted decorations, form the bulk of the subjects represented. Many excellent collotype plates from photographs enhance the utility and artistic appearance of the publication. The plates measure 12½in. by 19in.

HOUSE AT WOODLEY.

This small country house is being built at Woodley, Cheshire, for Mrs. Salmon, from designs by Messrs. Charles Clegg and Son, architects, Manchester. The lower portion is in rubble stonework, the stone being quarried in the district. The upper portions are of half-timber work in the Kentish style, with the roof covered with brown tiles, the wall tiles being red. Mr. S. Megarity is the builder.

Sir Richard Webster presided on Monday, in the dining-hall of the Royal National Hospital for Consumption at Ventnor, on the occasion of the unveiling, by his sister, Miss Webster, of a portrait of the founder, Dr. Arthur Hill Hassall, from the brush of Mr. Lance Calkin.

A new gas-holder erected by the Bristol Gas Company at Barton Hill was opened last (Thursday) evening. The tank, which has been constructed of Pennant stone, is 222ft. 6in. in diameter, and about 50ft. in depth. The gas-holder, which is of steel, is one of the largest in the provinces, and is capable of storing five and a-half million cubic feet of gas; it is 150ft. in height, and is in three lifts. Messrs. Aird and Sons, of Lambeth, were the contractors.

Trinity College, Glenalmond, situated on the banks of the Almond, about ten miles from Perth, was greatly injured by fire on Monday. The Prefect Common-room, together with the masters' sitting-room and the janitor's offices on the ground floor, a museum, and several sleeping-rooms on the second floor, and a large dormitory on the next floor, were destroyed. The damage is estimated at £5,000.

COMPETITIONS.

Bristol.—A special meeting of the Bristol Finance Committee has been held with reference to the laying out of the roads and open space above St. Augustine's Bridge. The city council recently instructed the finance committee to advertise for plans, and to offer premiums for designs for dealing with the space. "None of the designs sent in," says a local journal, "seemed quite to answer the expectation of the committee, and consequently Mr. Yabbicom, the assistant borough engineer, was asked to prepare plans, which he accordingly did." The plans first submitted were referred back for amendment, and the amended plans were submitted to the committee at their last meeting. In the revised scheme, Mr. Yabbicom proposes that a portion of the space should be thrown into the roadway at St. Augustine's Bridge, giving a total width of 160ft., and thus opening up a thoroughfare for vehicular traffic from Baldwin-street and Clare-street to Colston-street and College-green. With regard to the laying out of the open space, the proposal is that there shall be a central promenade 40ft. wide, laid with asphalte or impervious paving, and a gravel walk on each side 20ft. in width and edged with trees. The estimated cost of laying out the space as suggested would be about £1,300, and if the scheme were carried out in its entirety, including the alteration of the roadways and laying the new thoroughfares with wood pavement, the cost would be about £8,500. So far as the roads were concerned, the committee decided to accept the plans of Mr. Yabbicom, and to recommend the council to deal with the roads in the manner suggested; but as there was a difference of opinion as to the method of laying out the open space, that part of the scheme will not be reported upon at the next meeting of the council.

The Cripplegate Institute.—The governing body of the new Cripplegate Institute met, says the *City Press*, at the Quest House, Fore-street, on Tuesday in last week, to open tenders for the erection of the building. The scheme provides for the expenditure of £20,000 on the construction of the building, and certain selected firms were invited to submit tenders in accordance with the plans and specifications drawn by Mr. S. R. J. Smith, F.R.I.B.A., the architect whose designs were adjudged by Mr. Macvicar Anderson to be the best submitted in competition. These plans had been approved by the Charity Commissioners, and it was stated that a building such as that proposed could be erected at a cost not exceeding the stipulated sum. When the tenders were opened, however, it was found that the lowest tender was more than £7,000 above the sum mentioned. In these circumstances no tender was accepted, as the governing body found themselves in a dilemma. The matter is now under consideration, and it is not at present known what course will be adopted. It may be that the extra money required could be raised by subscription; but it is questionable whether such a proceeding would be regarded as fair to the other competing architects who were asked to furnish designs for a building not to exceed £20,000, and who, in the event of success, were to receive a commission of 4 per cent. upon that amount. In any case, the commencement of building operations will necessarily be delayed.

Dudley.—At the meeting of the School Board on Monday, the chairman reported that thirty-seven plans of the proposed new schools at Eve Hill had been sent in for competition. The selection ultimately lay between those prepared by the following architects:—Messrs. R. F. Matthews, Birmingham; A. Long, West Bromwich; F. Grazebrooke, Dudley; and A. Ramsell, Dudley. On the recommendation of the building committee, the Board accepted the plans of Mr. R. F. Matthews, Birmingham, on condition that the cost does not exceed the amount specified.

Mr. Bunting has been appointed borough surveyor of Maidstone, at a salary of £200 a year, and Mr. Grant has been appointed assistant surveyor to the same authority.

A new Roman Catholic church at Harrow was dedicated on Tuesday. It has been built from designs by Mr. Arthur Young, and is dedicated to Our Lady and St. Thomas of Canterbury. The style is Late Decorated, carried out in masonry, and there is a low battlemented tower crowned by a dwarf spire at the intersection of nave, chancel, and transepts. Messrs. Turner and Son, of Watford, were the builders.

WAYSIDE NOTES.

All who are really interested in the welfare of architecture should attend the closing sessional meeting of the Society of Architects at St. James's Hall next Tuesday week. The report of the council on the membership examination question will be submitted to that meeting, and I hope the recommendations of the council will, after suitable discussion, be unanimously adopted. After duly consulting the members, who appear to be unanimously in favour of the proposed changes, the council recommend that after October 31, 1896, election to membership will only be open to candidates who have passed the Society's examinations, a scheme for which is to be formulated by June 30, 1895. The exceptions to this rule are to be candidates over 35 years of age who have been directly engaged as principals for seven years, or as assistants for ten years.

I think it would have been better if no exceptions at all had been made; but the council have doubtless carefully considered the matter, and there *may* be reasons for the conclusion at which they have arrived, though I confess they seem all the other way to me. I don't see why able young men should submit to examination when if they wait till middle life they can slip in comfortably by a back door, and I trust these exceptions are destined to last but a very little while. In all else I wish the new examination scheme of the Society the most complete success. The council's provision for the enrolment of registered students is also an admirable one. For five shillings a year the student can enjoy all the privileges of ordinary membership till his 23rd year, when it is to be hoped he will duly pass his examination and become a full member. If the scheme succeeds—and I think it is bound to—we shall get the best features of the Institute and the Association combined under one roof at the Society of Architects, without the obvious drawbacks that of late years have diminished the popularity of the other two bodies.

A young foreign articled pupil, who knew English very imperfectly, according to the *Daily Telegraph*, was sent out to purchase sixpennyworth of drawing pins, of which the supply in the office had unexpectedly fallen short. He knew very well that in his own language a drawing-pin is known, among architects at any rate, as a "punaise," but not being quite sure of the English equivalent he determined to look up the office dictionary, where the only explanation given was "a bug." So he entered the shop of a bookseller and stationer in Holborn—was it Batsford's, I wonder?—and in broken English demanded "sixpennyworth of bugs." The astonished elderly gentleman behind the counter looked at him—you can all just picture to yourselves how Batsford senior would look—and replied, "We don't keep them here." Either the budding architect did not understand, or thought the shopkeeper was joking, for he commenced to vociferate and gesticulate "I 'av been send for 'em; you 'av' 'em; it is necessary for me to 'av' 'em—sixpennyworth of 'em, tout-de-suite." The shopkeeper thought he really had to do with a person out of his senses, and cautiously slipped along the counter into the wooden office, shut the door, and then again cried, "Go away; we don't keep them," followed by a summons for help. The bewildered foreigner went away, and narrated his experience to his colleagues in the office, who spent the remainder of the afternoon in laughter. He now knows that a "punaise" for a drawing-board is quite a different thing from the other.

The legality of rood-lofts in churches is once more before the Ecclesiastical Courts. The Chancellor of the Diocese of Norwich has held a Consistory Court to hear an application to grant a confirmatory faculty for a choir screen, rood-loft, and rood-beam in the Church of St. John, Timberhill. Sir Walter Phillimore contended that the Crucifixion was no more illegal as an historic representation than the Ascension or any other Biblical scene. The Chancellor inquired whether, as a matter of fact, all rood-lofts had not been destroyed, and Sir Walter Phillimore, in admitting this, pointed out that, not only had superstitious images been removed, but all images "except those of persons who were not saintly." The statute of Edward was repealed in Mary's reign, and not re-enacted under Elizabeth, and the test now was, not whether images or crosses were legal or illegal, but whether they were liable to be abused. The case of Bradford v. Fry, with regard to the chancel gates, was also discussed, and, after listening all day to the arguments of counsel in support of the faculty, there being no opposition from anyone in the parish or diocese, the Chancellor stated that, after such an array of authorities, he should reserve his judgment.

Continued success deservedly attends the Auctioneers' Benevolent Fund, of which the annual meeting was held on Monday in the Auction Mart, Tokenhouse-yard, under the presidency of Mr. Daniel Watney. The subscriptions during the past twelve months had exceeded those of any previous year, the amount being £322, as against £303 received in 1893. Seven persons had received assistance during the year, and the sum of £242 had been paid to twelve annuitants. The suggestion of Mr. Price that honorary secretaries to the fund should be appointed in large provincial towns and in agricultural centres had been adopted, with successful results. In the ten years ended 1893 £2,114 had been given in relief, while in the previous ten years the sum was only £524. This may be taken as proof of the progress of the fund.

An exhibition of the arts, crafts, and industries of Finland will be opened in London next month. Weaving is the common handicraft of the Finnish people, and few machine-made materials are used by them, though on the western boundary the petty trader has from time to time introduced foreign fabrics, which have been adopted by the more sophisticated townspeople. The embroidery exhibits will be of great interest, as pointing to the Oriental origin of this ancient people. The embroideries are heirlooms handed down from mother to daughter, and anyone comparing the Runo singer's costume and that of the North American Indian will notice the curious similarity. Most of the embroiderers know 73 of these patterns, and some of them have named over 300. Every small portion of the pattern has a distinguishing name of its own, borrowed from the pine-needles, birds' eyes, feathers, and, strange to say, Buddhist symbols which they resemble.

CHIPS.

At the recent Civil Service examination, lasting ten days, for assistant surveyors, R.E., civil staff, the following gentlemen were successful:—Messrs. L. Brown-Bagot, A.M.I.C.E., A. T. Walmsley, and G. H. Bryant.

The partnership heretofore subsisting between M. A. Manuelle, M. A. Manuelle, jun., and G. S. Manuelle, stone and granite merchants, Lime-street, E.C., under the style of Charles M. Manuelle, has been dissolved.

The town council of Ipswich discussed at great length at their last meeting the proposal to purchase the greater portion of Christchurch Park for the public recreation. The estates committee reported that they had provisionally negotiated for the purchase of 51 acres of the central portion of the park, including the Elizabethan mansion and the lodge, with three entrances, the sum to be paid being £16,000. A petition, signed by 5,600 ratepayers, was presented in opposition to the purchase, but happily, broader and more liberal-spirited views prevailed, and, by 23 votes to 11, it was decided to acquire the property as a park.

A special service was held on Wednesday week at the parish church of St. Thomas, Exeter, for the purpose of unveiling a window and brass tablet on grey marble mount, which have been placed in the church, on the north side, as a memorial to the late Bishop Medley, a former vicar of St. Thomas. The window, of stained glass, executed by Mr. F. Drake, of Exeter, occupies a place in the baptistery, and represents the Presentation in the Temple. The brass, or rather latten, is the work of Messrs. Harry Hems and Sons, of Exeter.

At the last meeting of the Southampton town council a portrait of the late Mr. R. S. Pearce, for 23 years town clerk of the borough, was unveiled. It has been painted by Mr. F. McFadden, and will be hung in the council chamber. At the same meeting it was unanimously decided to adopt Part III. of the Housing of the Working Classes Act, 1890.

At a meeting of the Langholm Burgh Commissioners, on Saturday, a letter was read from the Chamberlain to the Duke of Buccleuch, offering, as a free gift to the town of Langholm, the Town-hall and its site. The building was recently renovated by the Duke.

OBITUARY.

The Architectural Association has lost a good friend in the death of its hon. amateur photographer, Mr. John Loftus Robinson, R.H.A., T.C. of the city of Dublin, whose death we record with sincere regret. He died on Friday night last at his residence, "Rathruadh," Glenageary, from typhoid fever, at the early age of 46. Mr. Robinson was a member of the council of the Royal Institute of Architects of Ireland, and has been for a long while a member of the municipal council of Dublin, in which he represented Trinity Ward. In politics Mr. Robinson was an ardent Parnellite, and acted as secretary to the Nationalist party in the corporation. He was an active member of the National Liberal Club in London. For years he was chairman of the Kingstown Commissioners, during which time he secured the opening of a public park for the district. The Dublin Sketching Club owes much to his energy, the members being often entertained by him. Last week only he conducted the Royal Society of Antiquaries of Ireland to places of interest in the old city of Dublin. Mr. Robinson was ex-president of the A. A. Camera Club, and last February gave an address on "Architectural Photography" before the members at Great Marlborough-street, and during the same month he delivered an illustrated lecture at Conduit-street on "The Last Three A. A. Excursions." His genial, loquacious style, as he graphically described the buildings visited, was enlivened by wit and enriched by a knowledge of his subject in which he was enthusiastically interested. For fifteen years he has attended all these outings, acting as hon. photographer, and taking, from first to last, thousands of views, copies of which he presented year by year to the A. A. library. Only the week before last we reproduced two of his studies, taken on this year's excursion at Wells. He organised an excursion of architects to Ireland about five years since. Among the buildings erected from his designs, we may mention Kingstown Town-hall, overlooking the harbour; St. Michael's Hospital, Kingstown; St. Saviour's Dominican Priory, Dublin; completion of the Mater Misericordiæ Hospital, Dublin; St. Patrick's Training College, Drumcondra; the Female Training College, Bagot-street, Dublin; Convents of Mercy at Kingstown, Brickfield-lane, Dublin, and Newport; industrial schools at Booterstown and Goldenbridge; schools at Dundrum, Rathnew, and Dolphin's Barn; houses at Glenageary (where Mr. Robinson built himself a residence), in Dublin, and elsewhere. Among the buildings in progress from his plans at the present time are the National Schools, Carysford; the Industrial Schools and Novitiate Chapel, Blackrock, Dublin, costing £35,000; Whitefriars National Schools, Dublin, costing £6,500; St. Michael's Church, Kingstown, transepts, tower, and spire, £12,000; Dorset-street Schools, Dublin, £3,500; Terenure College additions, £6,379; St. Patrick's Training College, £12,806; and National Schools, Drumcondra, Dublin, £2,200 At the time of his death he was engaged upon designs to be submitted in the forthcoming select competition for the big asylum about to be erected at Portraine, near Dublin, at a cost of about £200,000. He was also preparing plans for a large extension of the Richmond Asylum, co. Dublin. Mr. Robinson was buried on Monday morning last, at Glasnevin Cemetery, when a vast number of clergy and friends attended, including Archbishop Walsh, who read the service at the grave, and the Lord Mayor of Dublin, several members of Parliament, the City Corporation, the Royal Hibernian Academy, and nearly every leading architect in Dublin, so great was the high regard and esteem in which Mr. J. L. Robinson was held by all who knew him.

The city council of Chester have authorised the improvement committee to accept a tender for re-erecting, at a cost of £180, Pemberton's Parlour, on the city walls, which collapsed last year.

A mosaic tablet resting on a richly-carved base has been placed in St. Augustine's Church, Highbury New Park, as a memorial of the late Prebendary Gordon Calthrop. The tablet was designed by Mr. J. Douglass Mathews, F.R.I.B.A., and the carving and mosaics are by Mr. Harry Hems, of Exeter, and Messrs. Powell, of Whitefriars.

A meeting of the works committee of the Edinburgh and District Water Trust was held on Monday, at which instructions were given for the lodging of the necessary Parliamentary notices in connection with the Talla scheme.

Building Intelligence.

Aston.—The new police-courts, erected on the site of the older buildings in Victoria-road, were opened on Monday by Lord Leigh. The building is in a Free Renaissance style, the front elevation of red brick, dressed with buff terracotta. Two terracotta friezes run the length of the building, and are ornamented with figures. From the main entrance and vestibule a large public hall is reached, from which a staircase, with wrought-iron balustrade and granolithic steps, leads to the first floor. On the ground floor there are various offices for the carrying-on of the clerical and other work; while in the basement the cells of the old police buildings remain intact. The two courts are on the first floor, and have in close proximity a magistrates' room, rooms for barristers and solicitors, for witnesses, and another for prisoners and their legal advisers. The two courts are similar in character, and are each 50ft. by 30ft. The furniture is of oak, and the walls are covered with a coloured plaster surface. The heating and ventilation are on the system laid down by Mr. William Key, of Glasgow. The building has been erected from the designs of Messrs. Mansell and Mansell, of Colmore-row, Birmingham, under the direction of Mr. John Willmot (surveyor to the county of Warwick). The contractor is Mr. John Bowen, of Birmingham. At the rear is a drill-yard, and overlooking this will soon be erected a police barracks, to accommodate 30 single officers.

Burslem.—The technical schools which have recently been built in connection with the Wedgwood Institute were opened by Princess Louise on Monday. The institute, which was erected about thirty years ago, has its principal façade in Queen-street, near the centre of the town. The design was emblematical of the arts of the district, and illustrative of the use of terracotta, its Pointed style being based upon those types of ceramic architecture so prevalent in Northern Italy during the 15th and 16th centuries. The building comprised a school of art, a laboratory, and a free public reading-room and library. It was enlarged, and it was decided in 1887 to further extend the institute by the addition of a technical school. The new buildings, which were designed and carried out under the superintendence of Messrs. Ford and Slater, architects, Burslem, comprise two blocks. That on the Baker-street side is three stories in height, with basement in addition. The ground-floor contains two modelling-rooms, on the first floor is an antique classroom, and above this is a laboratory, in connection with which are a lecture theatre, classrooms, balance-room, and master's room. The old museum at the rear of the institute is now utilised partly in connection with the school of art and partly by the science department. The second block of building is on the Brickhouse-street side, and is four stories in height. On the ground floor is provided a reference library and a librarian's department. On the first floor is a classroom for elementary art, whilst on the second floor is provided two classrooms for technical instruction, and on the top floor is a gymnasium. The Baker-street front is very plain, but the elevation to Brickhouse-street accords with the original part of the building. The walls of the buildings throughout are of red brick, with strings and dressings of terracotta, the floors being of fireproof construction of tiles laid on concrete resting on iron girders. The rooms are warmed by hot water on the low-pressure system, by Mr. W. Boulton, engineer, Burslem. The building contracts have been carried out by Mr. William Grant and Mr. William Cooke, of Burslem. The cost of the additional buildings, including fittings and heating, several alterations, and the redecoration of the original building, is upwards of £5,000.

Camden Town.—The chancel and other additions just made to St. Michael's Church were consecrated on Saturday last. The site of the church was bought in 1878; an iron church was built in 1879; the nave of the present church finished in 1881; a church room built in 1885; the Mission Buildings in 1888; and the church has been completed this year. The additions now made consist of the chancel, south aisle, and chapel. The chancel is in harmony with the nave and aisles, an adaptation of 14th-century architecture. It is of high proportion, its general dimensions being 48ft. long, 25ft. wide, and 59ft. high to the apex of the roof. The original design had to be modified considerably from want of funds, the chancel being shortened, the wooden waggon roof being substituted for a vaulted stone roof, and a simpler east window taking the place of the original design. On the north side, divided off by stone traceried screens, is a low stone vaulted chapel, contrasting well with the high chancel. The vestries still remain to be built, and the stone tracery has been omitted from the south screen on account of expense. A panelling of wood, painted dark olive green, has been added, and gives warmth to the appearance of the church; the walls of the nave have been plastered, and a warming apparatus has been put in. The roof has been decorated by painting three bands of scroll-work in each bay, and the aisles have been painted in red, with the sacred monogram in black and white. An inscription runs round the roof. The panelling and canopy behind the altar is richly painted and gilded. The church has been erected from the designs of Messrs. Bodley and Garner, of 7, Gray's Inn-square, the builders being Messsrs. Stephens and Bastow, of Bristol, with the assistance of their foreman, Mr. Hampton. In 18 years there has been spent in round figures on the site, £2,400; the nave, £9,500; the mission buildings, £2,100; while the portion just completed, including the outlay on the nave, has been about £5,500. The west front of the church was illustrated in the Building News for June 24, 1881.

Edinburgh.—A new hospital, in connection with the Deaconess Institution of the Church of Scotland, was opened by Lord Polwarth on the 11th inst. The hospital comprises, on the ground floor, doctors' and managers' rooms, a parlour for probationary nurses—kitchen, &c., with passenger lift and staircase; outside there is laundry and mortuary. The two upper floors contain the wards with accommodation for 20 beds. In the attic are the matron's bedroom, and another room which is set apart for any infectious cases. The wards are heated each with a Musgrave ventilating stove and an open fireplace, and ventilation provided by air inlets in the walls and special exhaust flues with inducers. The cost of the building is about £2,300, and with furniture and fittings, &c., about £3,000. The cost of maintenance is expected to be about £800 per annum. The architects were Messrs. Hardy and Wight, Edinburgh.

Newcastle-under-Lyme.—The Bishop of Lichfield attended on Sunday a service at St. Giles's Parish Church, Newcastle-under-Lyme, for the dedication of the work of restoration of the tower and the improvement of the bells. The massive sandstone tower, one of the finest in the county, dates back from the 13th century. It is 106ft. high, and the outside width is 33ft. 6in., the walls being 6ft. 9in. thick. The present church, which was erected from the plans of Sir Gilbert Scott in 1873, is the fourth fabric which has been erected against the tower. For many years the latter has been in need of restoration, the surface showing evidences of decay from the effect of time, and a wooden shoring being erected for its support at the north-west corner. About eighteen months ago Mr. F. Stanier, Peplow Hall, High Sheriff of Shropshire, undertook the work of restoration in memory of his family. The cost has been about £5,000, and the restoration has been carried out by Messrs. Willcock and Co., Wolverhampton, from the plans of Mr. Ewan Christian, London. All the stone has been refaced, but none of the original masonry has been taken away unless when necessary to insure the stability of the structure. The tower has a new roof and battlemented parapet, with four pinnacles, three being 22ft. in height, and the fourth, which carries a vane, rising 27ft. above the level of the floor. There is a flag-staff 45ft. high. The peal of eight bells, which were cast in 1732, have been re-tuned and rehung, at a cost of £150.

Roath, Cardiff.—Memorial stones of a new Congregational hall and vestry were laid at Roath on Wednesday week. The Roath public hall in Stacey-road has been purchased by the Congregationists for £15,000—being £800 less than it cost to build. The first part of the scheme is to erect a building at the rear of the Roath public hall, which may be used for public worship and Sunday-school purposes; and the memorial stones of this were laid on Wednesday week. The contract for this section has been taken by Mr. Styles, and amounts to nearly £800. The architects, Messrs. T. Waring and Son, have prepared plans whereby the side and back walls of the Roath public hall will be retained, but the front, which faces Oakfield-street, will be reconstructed, and thus provide sitting accommodation for 626 worshippers, which can be increased to 809 by the addition of side galleries. The total outlay for alterations and additions is estimated at £2,300.

Salford.—The new model lodging-house in Bloom-street, adjoining the gas offices, was formally opened on Saturday last. The site has a frontage of 150ft., and is 57ft. deep at one end and 120ft. at the other, the area occupied being 1,410 square yards. The scheme is based upon the successful design for the London County Council Model Lodging House (the competition for which was settled just about the time the buildings were determined upon), and this general principle has been adhered to throughout, though the London plans have been departed from in nearly every detail and in many important points. The building consists of two main blocks, each five stories in height, separated by a one-story entrance-hall. The dormitories occupy the whole of the three upper stories. The elevations are in common brickwork, relieved with terracotta dressings. Between the two main blocks is a hall 30ft. wide and 36ft. long, roofed with Duroline. Immediately on each side of the inner door are two offices. On the left side of the hall there is the day-room, 71ft. by 31ft., and 14ft. high, lighted on three sides by windows, and next to it is a locker room. To the right of the hall is the dining-room, 48ft. by 31ft., and adjoining are the grocery shop, crockery room, scullery, and kitchen. At the rear of the block, in a range of one-story buildings, are the lavatories, baths, conveniences, and laundries. Above the ground floor the plan resolves itself into two main blocks, with a connecting landing and staircase, and with conveniences semi-detached, on the pavilion system. The one block is 69ft. by 31ft., and the other averages 71ft. by 31ft., the clear height of each story being 12ft. Each of the three dormitories in one block is divided into 48 cubicles, each of the other three into 47, and thus there is accommodation for 285 lodgers. The cubic space allowed for each lodger is nearly 600c.ft. The cubicle divisions are of sheet steel, on Messrs. Falkners' patent. The ventilation is arranged on the "natural" principle. From the ceiling of each room a foul-air outlet shaft runs up to the roof, where it terminates in a cross tube running from one side of the roof to the other, with louvre outlets; so that the wind, from whichever direction it blows, may create an exhaust at one or the other end of the cross tube. The fresh-air inlets are all provided near the floor level. In the laundry a small disinfector has been set up on the Washington Lyons principle. The construction is, as far as possible, fire resisting. The floors of the dormitories and dayrooms are of solid planks, grooved and fitted with iron tongues; the stair treads are of greenheart timber, carried on steel framework; the cubicle divisions are of sheet steel. The floors of kitchen, scullery, and bathroom are constructed of rolled steel joists and concrete. Sets of fire-extinguishing apparatus are provided on each staircase landing; each set including a hydrant from the water main, a hosepipe and nozzle, and a set of fire-buckets. From each dormitory an external iron fire-escape staircase has been provided. A small detached manager's house has been erected on one corner of the site. The contractors for the main building were Messrs. Wm. Southern and Sons, Salford, who had with them as sub-contractors contractors the following firms:—Bricklayers, work, Messrs. Healey, Salford; terracotta work, Mr. Jabez Thompson, Northwich; concreter, Mr. B. Morton; masons' work, Mr. J. Stopford; slaters' work, Mr. J. Barrow; ironwork, Messrs. Carter Bros. and Co., Manchester; plasterer and painter, Messrs. R. Higson and Sons, Salford; plumber and glazier, Mr. J. Kershaw, Heywood; duroline glazing material, The Wirewove Roofing Co., London; and steel cubicle divisions, Messrs. Falkner and Co., Hersham. The plans, specifications, and quantities were prepared in the office of the borough engineer, and Mr. T. B. Patterson has acted as clerk of works. The cost has been: site £1,550; building £11,000; and furniture, &c., £2,300; in all, £14,850.

Trentham, Stoke-on-Trent.—Some important improvements are being carried out on the Duke of Sutherland's estate at Trentham, including the lighting of the hall by electricity, the motive power for the dynamos being obtained from the river Tent. The lake in front of the hall has been emptied for the first time for six years, and is being cleansed from an accumulation of mud. The hall is being redecorated, and a dairy is being added. The entrance to the hall grounds from the park has been remodelled, and new gates are being provided. A new drive has been cut from the entrance at the west front of the hall to the Whitmore-road, crossing the Hanford Brook by an elliptic bridge about 40ft. in length, the span of the arch being about 15ft. There will be an entrance lodge on the Whitmore-road. Other improvements are being effected in the park and gardens, and in the village the Duke is building a number of workmen's cottages, and near the old inn on the Newcastle-road a village institute. In the vicinity of the institute a girls' school, with mistress's house, is being erected. The whole of the work is being designed and carried out under the supervision of Mr. T. Roberts, the architect to the estate. The work has given employment to about 400 hands, and the cost will probably exceed £20,000.

◆

CHIPS.

Considerable progress is being made with the alterations and extensions which the Great Western Railway Company are carrying out at their Taunton station. The work of laying the new loop line for goods traffic, which is to be about a quarter of a mile long, is being rapidly pushed forward. The company are expending about £25,000 in improvements at Taunton.

The proposed railway bridge across the Hudson at New York will cost about £2,800,000, and the superstructure about £2,250,000. In addition, the land to be expropriated on either side is estimated to cost another four or five millions. The clear central span is 2,020ft. and the construction will be, like the Forth Bridge, on the cantilever principle.

Mr. Henry Westlake, of Chumleigh, Devon, formerly architect and surveyor on the Preston Estate, but who had retired from practice for some years, died last week, aged 76 years.

The Government of India has decided to spend 520 lakhs of rupees this year, and 500 lakhs in each of the two following years, on railway construction and irrigation works. This will provide for the commencement of the Rohri-Kotri line, the linking up of the mètre gauge lines in the North-West Provinces, and the Ennore-Madras section of the Bezvada-Madras line during the current year.

At Friday's meeting of the Waterworks Committee of the Leeds Corporation, the engineer (Mr. Thomas Hewson) reported that the reconstruction of the Eccup embankment was proceeding satisfactorily, that the whole of the puddle wall was now removed out of the trench, and the trench lowered to a depth of 145ft., being, at the southerly end, within 14ft. of the intended total depth. Mr. Hewson also reported that a new 30in. water-main which is being laid between Arthington and Swinsty, to complete the third line of water-mains from the latter reservoir, was laid to the extent of three miles out of the total of eight.

Mr. W. J. Bird Clerke, M.Inst.C.E., held an inquiry at Stratford, E., last week as to an application of the town council for sanction to borrow £11,507, the chief items being £1,990 for widening Forest Gate bridge, £2,815 for pitching Bidder-street and Quadrant-street, and £1,465 for paving the paths round the recreation ground at Canning Town.

Major-General H. D. Crozier, R.E., a Local Government Board inspector, held an inquiry at Fenton, Staffs, on Friday, as to the application by the local board for sanction to borrow £6,150 for the purposes of street improvements. Mr. S. A. Goodall, surveyor, gave evidence in support of the application, to which no opposition was offered.

The statue erected in Queen's Park, Toronto, to the memory of the late Sir John Macdonald, was unveiled on Saturday by Sir John Thompson, the Premier. The statue, which is in bronze, and the actual life size, stands in front of the Parliament Building, near the statue of the late George Brown. It is the work of Mr. Hamilton MacCarthy.

The death is announced of Mr. Henry James Eyre, late registrar of and for 36 years in office at the Royal Academy. Mr. Eyre died on the 10th inst. at his residence in Maida Vale, in his 87th year.

At Worcester, on Friday, the corporation electric light works were opened. The current will principally be generated by turbines placed in the river Teme at Powick, where there is a fall of 12ft. From Powick the current is conveyed underground a distance of three miles to Worcester, and there distributed. Besides lighting the streets and public buildings, the electric power is used for pumping at the corporation waterworks, and the council supply the electric current to private consumers for either lighting or motive purposes.

Correspondence.

ARCHITECTURAL PHOTOGRAPHS.

To the Editor of the Building News.

Sir,—One of your correspondents in last week's issue of the Building News suggests that the project for the exchange of architectural photograms is one which might well commend itself to the A.A Camera Club.

Well, Sir, the A.A. Camera Club is fully alive to the importance of the exchange of architectural photograms, and on the initiation of its vice-president, Mr. E. W. M. Wonnacott, the A.A. Postal Print Exchange Club has been formed, having for its objects the criticism and exchange of architectural photograms. The first portfolio was put into circulation on October 1st last, amongst members of the A.A. Camera Club; but it is proposed to extend the privilege to all A.A. men, and a scheme is now under consideration whereby architects and architectural students at present outside the pale of the Architectural Association can participate in the advantages offered.

If any of your readers will communicate with either Mr. Wonnacott or myself at 56, Great Marlborough-street, W., further particulars will be furnished with pleasure.—I am, &c.,

Francis R. Taylor,
Hon. Sec. A.A. Camera Club.

Sir,—I am proposing, with the consent of the Council of the Royal Architectural Museum, to arrange, after the pressure of the year's session of our School of Art classes is over in the spring, an exhibition of architectural photographs of a thoroughly representative character, and with this view shall be glad to receive offers of co-operation from amateurs as well as professional photographers. New as well as old work will be included, provided the subjects are of artistic merit and general interest, and the scheme will be so extended as to include decorative and sculpturesque subjects.—I am, &c.,

Maurice B. Adams, Hon. Sec.
Royal Architectural Museum, Tufton-street,
Dean's Yard, Westminster, October 12.

Sir,—I fully concur in the admirable remarks upon "A Neglected Resource," as given in the leading article of your issue of the 8th inst., and with the letters of Mr. Anderson, A.R.I.B.A. and "Gothic," thereon in your present issue. It will give me pleasure to join such a proposed society, and as an amateur photographer afford any assistance I can to further the object in view.

In a paper read by the writer before the Society of Architects on the 20th April, 1893, upon the subject of "The Use of Photography in its Relation to Architecture," it will be noticed in the paper read (on page 146, Vol. V. No. 10 of the Society's *Proceedings*) that some such club or society was proposed therein, having similar objects in view (together with the loan of lantern-slides of interesting architectural subjects for lectures, &c.) to those set forth more fully in your article.

Such a society as you suggest would, I am sure, prove to be the medium of affording information to architects, and especially to architectural students, of a nature very valuable and instructive, and that could not by other means be obtained, or in a manner so economical.—I am, &c.,

William Allport, F.S.I., M.S.A.
Bedford Mansions, Henrietta-street, Covent
Garden, W.C., October 13.

◆

A new schoolroom has been recently erected in the village of Boxted, Essex, as an addition to the school close to the church. The new room is 40ft. long by 18ft. wide inside, and is built of red bricks with slated roof. The room has been built by Messrs. N. Saunders and Son, of Dedham, to plans prepared by Mr. J. W. Start, F.S.I., architect, of Colchester, Clacton, and Harwich. The total cost has been £359.

A party of visitors from inland towns were invited to Pwllheli, on Saturday, by the Mayor of that Carnarvonshire watering-place, for the purpose of viewing the great development which has taken place there since the Victoria Parade was opened six years ago. At his own cost Mr. Solomon Andrews, the head of a local syndicate, is laying down a tram-road extending 2½ miles along the beach, and is constructing a road and bridge, which he purposes conveying to the corporation. He has also erected an hotel, at an outlay of £8,000.

Intercommunication.

QUESTIONS.

[11227.]—**Sound-proof Rooms.**—I built a house some time ago, and being a light sleeper, instructed my architect to take means to insure my having a quiet bedroom. He accordingly packed the floor overhead between the joists very tightly with silicate cotton, and stuffed the plaster walls on each side with the same. Having my dressing-room on one side, and my smoke-room on the other, there is no noise from them; but it being necessary to use a room above as a servant's bedroom, and having a robust little kitchen-maid occupying it whose duty it is to rise early, and whose lightest tread is ponderous, the noise from above is distracting. Can any one tell me how to cure this without disusing the room overhead? Would a raised platform of 4in. or 5in. mend matters? My own architect doesn't seem to be able to offer any suggestion. —Q.

[11228.]—**Bills of Quantities.**—What is the recognised percentage to be charged by architects generally for preparing bills of quantities? There is a firm here that is charging 3 per cent. besides "expenses" for a job of from £11,000 to £12,000. Is not this excessive? Perhaps some architects would state in your columns the rates they usually charge.—Provincial.

[11229.]—**Priming Internal Joiners's Work.**—Is it desirable to prime internal joiner's work (intended to be painted) prior to its being taken to building, so as to prevent the usual swelling of wood and flying of joints caused by the moisture from new plastering, as work is now carried out hastily?—Learner.

[11230.]—**Steel bearing middle Gutters to Roofs.**—Are these an improvement over cast or wrought iron, and how are they as to durability?—Sceptic.

[11231.]—**Wasted Stone.**—Can any reader of experience favour with a few useful hints as to the best treatment? I am thinking of redressing the stone, and painting it with Szerelmey's or Ransome's fluid, but am informed that this won't last long. What is the best treatment known?—Manxman.

[11232.]—**Domestic Hot-Water Supply.**—Should flow-pipe from boiler to cylinder be of greater diameter than return-pipe of same—say, 1in. flow, and ¾in. return? Is there any objection to blow-off pipe being turned down into supply cistern, so as to dip into cold water, and thereby prevent dampness arising from steam issuing into the open air of cistern-room. For protecting hot-water pipes underground or in chases, I am given to understand that sand or sawdust are good non-conductors, and not only prevent the radiation, and consequent loss of heat, but form a good protection against frost. If this is so, would not hair-plaister be an economic mode of covering pipes?—Teachable.

[11233.]—**Metal Laths.**—What are the best metal laths, and how are they fixed to the studs? Is metal lathing more expensive than the ordinary fir laths? I should be obliged for any information.—J. P.

[11234.]—**Staining Timbers.**—Which is the most approved plan—to stain and varnish the exposed timbers of a church roof? or to leave them quite plain? A gentleman, an authority on such matters, thinks the latter course the best, and says many of the most recent church roofs have the timbers left quite bare. Can anyone give me the names of a few churches near London so treated and the names of the architects? Ceiling between the rafters, once common, is also said to be going out in favour of boarding. I should like to hear a few opinions on this head and the advantages of boarded roofs.—One Who Wishes to Learn.

[11235.]—**Ash Vents to back of House Firegrates.**—I should like to know the desirability of providing these or otherwise from under side of firegrate up back of same to smoke-flue gathering over fireplace opening?—Doubtful.

REPLIES.

[11226.]—**Iron and Steel Girders.**—Steel may be distinguished from wrought iron by placing a drop of dilute nitric acid (1 acid to 4 water) upon the surface. If the metal is steel, a dark-grey stain will be produced, owing to the separation of the carbon.—P. G. F.

◆

The town council of Aberdeen approved on Monday a scheme for declaring the Exchequer-row an unhealthy area under the Housing of the Working Classes Act, the cost of acquiring the lands and buildings, clearing the sites, and incidental works being estimated at £25,776. It is calculated, however, that from the ground that will be feued off there will be an annual revenue of £365, which at thirty years' purchase amounts to £10,950. The net cost of the scheme will thus be about £14,826.

A block of stores for chilled meat is about to be built in St. John-street, near Smithfield Market, from plans by Mr. H. F. Donaldson, the engineer to the India Docks Joint Committee. Accommodation will be provided for between 80,000 and 90,000 carcases. The building, covering an area of nearly 10,000sq.ft., and constructed of red and blue bricks and terracotta, with a main frontage 131ft. in length, will consist of basement, ground floor, and four floors above. There are to be 16 cold chambers in all, their total capacity being 360,000c.ft. On the ground floor will be a range of shops and offices. In the basement immediately underneath will be the engine-room and boiler-house, in the former of which will be placed two sets of hydro-carbonic refrigerating engines, together with the pumps and condensers, as well as the machinery required to light the whole of the chambers by electricity.

Legal.

COPYRIGHT OF PLANS.

SOME architects and others have thought that by the registration of plans for buildings as copyright, they could prevent people from building according to the same design or upon the same model. This, however, does not appear to be so, for though pirating the publication of such plans would possibly be illegal, there seems no way of stopping the erection of a building that would be identical. The recent case of "Hollinrake v. Truswell" (*Times*, 9th Aug.) is of practical importance because of the general principles laid down in the judgments given by the Court of Appeal, and especially by that always luminous lawyer, Lord Justice Lindley. This case arose about a cardboard pattern sleeve, which was called a "sleeve-chart," and which really consisted of the shape of a sleeve for a woman's dress with figures and words upon it, giving directions by which it might be used for the purpose of cutting out such sleeves scientifically. Mr. Justice Wright had held that the thing came within the Act as a chart or plan, and so could be registered for copyright, and he granted an injunction to stay any infringement by the defendant. On appeal this was reversed, on the broad ground that the so-called chart was really a measuring machine like a mathematical rule, and that although, if new, it might be the subject of a patent, it could not be registered as copyright, and the appeal was allowed, with all costs.

In his judgment Lord Justice Lindley said that copyright does not extend to ideas or schemes, or systems or methods. It is confined to their expression, and if their expression is not copied, then the copyright is not infringed. There was one case in which the author of a system of bookkeeping had registered his book as copyright; but it was held that he had not thereby acquired any monopoly in the system but, was only able to prevent any other person from copying his description of it as published. So with the plans of a house: they might probably be registered as copyright if published, and no one would be able to copy them as to words and figures &c., legally. But, even if this were done, it would not give the author any monopoly in the idea which really formed the basis of those plans, and upon which they had been drawn. Thus we should say that a house could be built upon the same design by anyone who could draw up the plans from the house itself. Of course, unless published, there could be no copyright at all under the Act in plans of this kind, and even then it may be doubted whether they would, strictly speaking, come within the Act, so as to be entitled to its protection in practical use, though probably their actual publication by others could be prevented.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

Architect. — Land. — Tenant. — Building.—In this case it appears that a yearly tenant built two cottages upon the land he rented, and paid this rent for 20 years. But having no lease, he is still only a yearly tenant, and his successor or assignee can have no better title upon the facts as stated.

W. J. P. — Land. — Agreement. — Enforcing. — The receipt signed by the vendor's agent and yourself is too vague to support an action for specific performance, and therefore I do not consider they can compel you to accept the terms now proposed, or to go any further in the matter. I presume, of course, that there is nothing else signed by you?

L.—Chimney.—Summons.—Time. —It would generally be issued against the builder or contractor, though the owner is also legally liable. The time limit is six months from date of offence, or of its discovery.

J. H. C.—Building.—Lease.—Damage.—If the lessee has covenanted to uphold and maintain and the like, he would be liable to do this work as between him and the lessor. But he may have some claim for compensation against the corporation upon proof of the facts here stated.

Scottie.—Drains.—Obstruction. — Strictly speaking, A. had no legal right to block up this right of way without C.'s consent. But as this appears to have been tacitly given, or, at all events, no objection was made until the work was half-done, the Court would not grant any injunction.

B. B.—Architect.—Contract.—Dispute.—I consider that the client should pay the architect, and that if he does not do so he could be sued for the money. The client could then only set up a counter-claim for damages on the ground of the architect's negligence; but he would have to prove a good deal to succeed in that contention, and he would also have to show that loss had resulted to him directly from that negligence.

LEGAL INTELLIGENCE.

In re J. H. Jefford. — James Harris Jefford, against whom a receiving order has been made, states that, having for several years previously been employed as a journeyman carpenter and foreman, he commenced his present business of a builder in September, 1890, and continued the same at Victoria-avenue, Upton-park, E., and elsewhere, down to the date of the receiving order. From the observations of the Official Receiver, it appears that in July, 1884, the debtor, having for a few years previously carried on business in partnership, was adjudged bankrupt, with liabilities £1,051. Under these proceedings no dividend was paid, and his discharge was granted in March, 1885. In June, 1888, in connection with a liability subsequently arising out of the partnership referred to, he was again adjudged bankrupt, his discharge being granted subject to a suspension of about eight months, expiring on December 31, 1889. The debtor attributes his present failure to losses (especially during the last two years) on contracts taken at too low a price, and of which he kept no proper account. He has furnished a statement of affairs showing liabilities £5,127, of which £4,877 are unsecured, with assets £351. An adjudication of bankruptcy has been made.

Alleged Jerry Building at Chiswick.—At the West London Police-court, on Friday, a Mr. Marsh, who was convicted in penalties last week in respect of a building in Chiswick, complained that he had received a notice from the local board threatening to pull the building down. He thought the payment of the penalty ended the matter. Mr. Curtis Bennett said it did not. There would probably be a summons taken out to show cause why the building should not be pulled down. The applicant thought it would be unjust to pull down a sound building. Mr. Curtis Bennett: That is a question. I saw the mortar when it was produced. The applicant declared emphatically that the statement respecting the quality of the mortar was false.

Swansea Waterworks.—A meeting of the water and sewers committee of the Swansea Corporation was held on Tuesday to consider a proposal for the settlement of a claim brought by Messrs. Balary and Yerburg, the constructors of the Upper Lliw reservoir, for £67,000 extras claimed. The question has for thirteen days been the subject of arbitration before Mr. Bucknill, Q.C., M.P., sitting in London, and the offer of the claimants was to settle for £10,500, each side to pay its own costs and half each of the arbitration and shorthand writers' charges. The committee decided to accept this offer. The following are the full terms of the settlement:—"The corporation to pay the contractors the admitted extras and retentions, which has been agreed to at £8,447 3s. 7d., and the further sum of 10,000 guineas. The plaintiffs to take out of court the £125 4s. 5d. still in court. Each party to pay their own costs, notwithstanding any order to the contrary, including half the arbitrator's fee, the shorthand notes, printing, and the expense of room. If any difference arises in carrying out these terms, the same to be referred to Mr. Hudson and Mr. Graham, and, if they differ, to the arbitrator."

What is a New Street?—London County Council v. Miller.—This case, which has been in progress from time to time since 1890, was again before Mr. Bros at the North London police-court on Friday. The parties now appeared to consult with the magistrate as to a case to be presented before the Judges of Appeal. Miller's-avenue is made up of houses built upon the site of houses and gardens demolished when the North London Police-court was erected. At the end of 1888 Miller's-avenue was commenced, with a 22ft. roadway; and the London County Council summoned the builder—Mr. James Miller, a local auctioneer—for contravention of the Metropolitan Building Act by laying out a road, passage, or way which was a new street within the meaning of the Act at a less width than 40ft. On that summons Mr. Bros decided that Miller's-avenue was a private place, having gates at the entrance, capable of shutting out all but the actual tenants; and, therefore, that it was not a new street within the meaning of the Act. When, in 1890, Miller's-avenue was extended by adding more houses, another similar summons was brought; but Mr. Bros decided in favour of the defendant, on the ground that the circumstances had not materially altered, and that it was no more a new street than it was before. The case was carried to the High Court, and on a technical objection was dismissed. Following this, another building was added to Miller's-avenue, somewhat higher than the remainder, and the London County Council issued another summons for contravening the law as to the height of buildings in a street. Mr. Bros held upon that, that there was no contravention of the law, because the place was not technically a street; but the defendant, to avoid litigation, brought down his building to a level with the other buildings. The London County Council, however, brought another summons, when it was decided to be *res judicata*, and that the defendant had certificates of dismissal of the summonses already brought against him in respect of this property, and the statutory period for upsetting the certificate, which declared Miller's-avenue to be not what is technically known as a new street, had expired. In deciding the case to be laid before the judges, Mr. Bros now said that he had again viewed the place, and his opinion was unaltered that it was not a new street within the meaning of the Act. But, of course, if the judges held him to be wrong, in his decision in 1890, the case, as then presented, would have to come back to be tried upon its merits. The only case to send to the judges was as to whether he was right in accepting the certificates of dismissal as a defence to the later summonses.

CHIPS.

The Duchess of Rutland opened yesterday (Thursday) the new building of the Midland Deaf and Dumb Institution at Derby.

Wesleyan school extensions at Woolfold, near Bury, Lancs, were inaugurated on Saturday. Mr. Byrom, of Bury, was the contractor for the building, which comprises an infants' room, with two classrooms above.

The Bristol Corporation will promote a Bill next session for the extension of the boundaries of the borough. Powers will be sought for so enlarging the municipal area as to include the parishes of Horfield, Stapleton, St. George, Kingswood, Shirehampton, parts of the parish of Westbury-upon-Trym, Henbury, Mangotsfield, Bedminster, Brislington, Long Ashton, and Easton-in-Gordano.

The Archbishop of Canterbury opened on Saturday a new wing of the Croydon General Hospital. This is the second addition that has been made to this institution, the last having been made in 1885. Two wards, each containing 20 beds, form the principal features of the present extension, whilst additional accommodation for the medical staff and servants has been provided.

The Ipswich corporation received at their last meeting a favourable report as to experiments that have been made by the borough surveyor, Mr. E. Buckham, in the deodorisation and sterilisation of sewage by the Hermite process, in which electrolysed sea-water is employed. They decided to expend £2,000 in providing Hermite plant, the annual cost of treatment being estimated at about £400. It was reported that part of an Early Norman church font, found by Mr. F. Bennett, builder, while excavating foundations for a factory through the Town Ditches, near Crown-street, had been presented by Mr. Bennett to the borough museum.

The churchyard cross at Fillongley, Warwickshire, which has long been in a very dilapidated condition, is about to be restored by Messrs. Farmer and Brindley, of Westminster Bridge-road, S.E.

Tweedy's brewery at York has just been reopened after the addition of a new copper and a new heating tank. The building operations have been carried out by the following local tradesmen:—Bricklayers' work, Mr. J. R. Manfield; joiners' work, Mr. R. Harker; plumbing, Mr. Geo. Best.

Major-General Crozier held a Local Government Board inquiry at Nantwich, on Tuesday week, as to the schemes of the local board proposing to borrow two separate loans of £1,200 and £1,150, for works of water supply and sewage respectively. The inquiry was attended by Mr. Baldwin Latham, as consulting engineer to the local board.

At a meeting of the Fraserburgh Harbour Commissioners, on Saturday, tenders for the deepening of Balaclava Harbour and relative works were submitted, and that of Messrs. Price and Wills, of Westminster, amounting to £39,805 0s. 8d., was accepted. The additional works scheduled but not included in the tender, contingencies, &c., will bring the total cost of the improvement scheme up to £50,420 15s. 8d.

Mr. Holman Hunt has been appointed by the Chancellor of Oxford University to be Romanes Lecturer for the ensuing year.

An immense number of papyrus documents has lately come into the possession of the Royal Museum of Berlin. About 5,000 of them have already been catalogued, and the Museum Commissioners are making arrangements for the editing and publication of some of the most important. The whole of these papyri are in the Greek language, and they throw a flood of new light upon the smallest details of the daily private life and the legal affairs of the Greek people in the first century of the Christian era.

WATER SUPPLY AND SANITARY MATTERS.

Gloucester.—The mayor and corporation of Gloucester paid a visit to Newent on Monday week, for the purpose of inaugurating the new waterworks, which are to be constructed under contract by Messrs. Timmins and Son, Runcorn, by virtue of the powers obtained in the Gloucester Corporation Act 1894. The work undertaken is to sink a shaft into the new red sandstone, and erect a pumping-station on a site given by the trustees of the Onslow estates for certain considerations, in the parish of Oxenhall, just outside Newent, the water to be pumped into a service reservoir, and from thence delivered into Gloucester by the natural force of gravitation.

Thirlmere Water Supply to Manchester.—The supply of water secured by the Manchester corporation from Lake Thirlmere was inaugurated on Monday. The training well at the south end of the lake, and the sluice-valve house at the north end of it, are built of grey rock, with redstone copings and battlements, and in a castellated style. The dam itself at the north end of the lake is 18ft. 6in. wide at the top and 50ft. at the bottom. Its depth in the deepest part is 58ft., and its total length is 857ft. Its exterior faces are of masonry, and the space between them has been filled with layers of concrete 9in. deep alternated with 3½ ton monoliths. The aqueduct is carried from the lake to Prestwich reservoir, near Manchester, a distance of about 96 miles. When the level of the lake has been raised to the contemplated height of 50ft. above its original level, Thirlmere will be equal to a supply of 50 million gallons daily for 150 days without rain. The aqueduct consists of tunnels through Dunmail Raise, Moore How, Nab Scar, Skellgill, and other places, making in all about 14 miles; 38 miles of "cut and cover," or concrete waterway cut in the open and covered over; and 44 miles of cast-iron pipes. The tunnels and "cut and cover" have been made and constructed to meet the necessities of the full supply of 50 million gallons daily, but the piping to a great extent is equal to no more than present needs. For the present, the level of Thirlmere has been raised 20ft., equal to a supply of 10 million gallons daily. The whole of the works have been carried out from plans by, and under the supervision of, Mr. G. H. Hill, M.Inst.C.E., of Manchester, at a cost of two and a half millions sterling. The supply was inaugurated by a display of a jet of water from a fountain in the centre of Albert-square, Manchester. The fountain, which consists of two basins, has been erected by Messrs. Southern and Son, contractors, Salford, from the designs, and under the superintendence of, Mr. J. W. Beaumont, architect, Manchester.

Wootton-under-Edge —The new water supply obtained from Hamlin Brake, on the Tetbury-road, was inaugurated last week. Mr. A. P. I. Cotterell, of Bristol, has been the engineer, and Mr. Stephen Ambrose, of Bath, contracted to carry out the works, the cost amounting to about £3,200. Mr. Butler was the resident engineer and clerk of the works. The water is conveyed from Hamlin Brake in cast-iron 4in. mains to a reservoir of concrete holding 99,000 gallons, the site of this service tank being 200ft. above the town, and about a mile distant from Wotton. From the service tank the supply is conveyed in 4in. and 3in. cast-iron pipes through the town. Altogether five miles of piping are used.

The town council of Cardiff have proceeded another stage towards providing a town hall more worthy of the borough. They have adopted a plan prepared by the borough engineer for utilising land adjoining the existing building. Part of the additional area will be thrown into the principal streets, and the remainder, having a frontage to Westgate-street of 332ft. and to Quay-street of 150ft., will be built upon.

A new epoch is dawning over historic Bamburgh. Lord Armstrong, who has bought the castle, contemplates vast changes and improvements. Sites are marked off on the estate for workmen's houses, and already a gang of men is busy at the castle, the operations at which are calculated to extend over some years. Meantime, the parish church of St. Aidan is being restored at a cost of about £2,000, and the public monument to the North-Country heroine, Grace Darling, who was born and died in Bamburgh, is also to be repaired.

It has been decided to hold at the New Gallery during the coming winter an exhibition devoted to the arts of Venice and the territories of the Republic. The tradition of Venetian style, which is so closely linked with the subsequent development of modern European art, will be traced from the date of its origin down to the close of the 18th century. Apart from painting, it is intended to include examples of the drawings of the Great Masters, besides specimens of sculpture, engraving, goldsmiths' work, pottery, glass, metal-work, arms, armour, furniture, wood-carving, embroidery, lace, and articles of costume.

Our Office Table.

The Royal Scottish Academy is at present applying to the Privy Council for certain amendments on the Supplementary Charter which was obtained a year or two ago. The chief points are:—(1) There is to be an honorary retired class of Academicians and Associates, to which they retire of their own will. But if a member fails for five years to fulfil his duties, he can be put on this list by a two-thirds majority vote of R.S.A.'s. This class can only exhibit one work in the exhibition. They can speak at meetings, but not vote; and while retaining their titles cannot serve on Council. (2) Under another provision it is enacted that R.S.A.'s are to decide what proportion of painters, sculptors, and architects are to be elected; nominations are to be made in a book, and there are regulations as to fixing the number to be elected and the method of proposal. (3) The other important provision reads as follows:—"We hereby give to the members of the Academy, at these assemblies of Academicians, power to make rules providing that any member of the Academy who, after the date of this Supplementary Charter, shall become a member of, or exhibit with, any other society of artists established in Edinburgh, shall forfeit his membership of the Academy, and all the rights and privileges pertaining thereto; provided always that such rules shall not apply to members of the Academy elected prior to the date of this Supplementary Charter, who may, after its date, exhibit with any society of which they were members prior to the date of this Supplementary Charter."

At the last meeting of the London School Board, a report was submitted by the Sanitary Sub-Committee upon the progress made in carrying out sanitary improvements to the schools of the Board. They stated that reports had been received upon all schools, with the exception of four. The Committee submitted a rough estimate of the probable cost of dealing with the drainage of the whole of the schools of the Board, amounting to £151,370. The Department were sanctioning loans for the full amount of the expenses required for carrying out the new drainage scheme. The sanitary surveyor was carrying out the necessary improvements at 18 schools, in addition to those which were in the hands of the architect.

In the second lecture on Egyptian history at University College, London, delivered on Saturday, Professor Flinders Petrie noticed the importance of the defect of the Egyptian calendar caused by its omitting to notice leap years. The day which was thus omitted every four years made the whole calendar retrograde through the seasons once in 1,460 years; this period was known as the Sothaic cycle. Every month of change was celebrated by a great festival, which fell every 120 years; while every week of change a lesser festival came once in 30 years. These feasts thus form most important landmarks for fixing the absolute dates and the intervals of various reigns. Mahler of Vienna has calculated the date of Thothmes III., in the middle of the XVIIIth Dynasty, as being from 1503 to 1449 B.C., and the festival in his reign at 1470 B.C. This is exactly confirmed by an inscription lately noticed, dated in this year—the 33rd of his reign—and naming this festival only a few days after it had taken place. Four other such fixed dates are known within three or four centuries, and in this manner a firm footing is obtained for Egyptian chronology, about which very little doubt remains as far back as 1600 B.C.

At Monday's meeting of the Halifax School Board, a discussion arose as to the acceptance by the sites and Building Committee of the tender of a Halifax firm, Messrs. Blackburn and Davenport, for slaters' and plasterers' work at Siddal School, at £514. Mr. Shoesmith, who moved the rejection of this minute, argued that the committee had practically boycotted one of the town's most respectable tradesmen, and caused the board to pay from 18 to 20 per cent. more for the work. With respect to the tender he alluded to, that of Messrs. Bancroft and Son, the committee wrote that firm asking if they paid the standard rate of wages in the district, and the firm asked the board to be good enough to send them the standard rate, and to state who fixed it—a very pertinent inquiry. Without replying to Messrs. Bancroft's letter, the committee accepted the tender of Messrs. Blackburn and Davenport. Messrs. Bancroft, the speaker understood, had in their employ a number of men who had been with them thirty or forty years, and who were willing, rather than be cast upon the streets, to take lower wages, yet the committee, by their action, boycotted them. Other members thought the committee justified in their action, and ultimately Mr. Shoesmith withdrew his motion.

According to the communication from Lieut.-Col. Duncan A. Johnston, R.E., read at the last meeting of the Southampton town council, the revision on the 1-2500 scale of the Ordnance Survey plans of the county of Hants has been commenced. It will not include at the public cost the revision of any plans on a scale larger than that of 1-2500 or 25·344in. to a mile. The Mayor and Corporation of Southampton were asked if they desired to have the existing plans of the town on the 1-500 scale revised at the cost of the town when the survey of the adjacent district was taken up. The difference of cost between a revision of surveys on the 1-2500 and the 1-500 scales might be taken to amount on an average to about 15s. per acre; while if new large-scale surveys outside the area of the existing plans were likely to be required, the additional cost might be estimated at about 30s. per acre. The above rates did not include the cost of publication. If the town should desire that the revised plans should be published on the 1-500 scale, the cost would be about 4s. an acre in addition. If the Corporation should not consider it necessary to have the existing large scale (1-500) survey of the town revised by the Ordnance Survey Department, on payment by the Corporation of the above difference of cost the revision and publication of the plans of the town would be carried out at the public expense, and without any charge against the town, on the same scale as the plans of the adjacent country, namely, 1-2500 or 25·344in. to a mile. The communication was referred to the Works Committee.

At the annual convention of the Western New York Chapter of the American Institute of Architects held in Rochester, N.Y., on Monday September 24, a committee reported unanimously in favour of the proposed State license law for architects, whereby each one in the profession will be prohibited from styling himself a "professional" architect unless he has first been given a State license. The Legislature two years ago passed such a law, but the Governor failed to sign it. It is now proposed to revive the bill, for the licensing, or as we should term it, registration of architects, on the ground that public safety requires that the buildings in our cities shall be in the hands of competent persons, the same as our physical bodies. The report was adopted unanimously.

The following is an authoritative list of town councils which have adopted the fair wage clause: — Accrington, Ashton-under-Lyne, Barrow, Blackburn, Blackpool, Bolton, Bradford, Brighton, Bury, Birmingham, Bristol, Cardiff, Derby, Dublin, Edinburgh, Glasgow, Gloucester, Grimsby, Halifax, Hull, Ipswich, Leeds, Leicester, Liverpool, London, Manchester, Northampton, Nottingham, Oldham, Plymouth, Rotherham, Salford, Scarborough, Sheffield, Sligo, Stockton, Stafford, Southport, Sunderland, Swansea, Wakefield, West Ham, West Hartlepool, Widnes, Wolverhampton.

On Saturday an application was made to the Chancellor of the diocese of Norwich for a confirmatory faculty for a choir screen, rood loft, and rood beam in the Church of St. John, Timberhill. The arguments occupied the whole of the day, and the chancellor reserved his judgment.

The Bishopsgate Institute will be opened on Saturday, Nov. 24th. It has been built from designs by Mr. C. Harrison Townsend, F.R I.B.A., selected in competition, and is Early Renaissance in style. Mr. J. T. Chappell was the original contractor, and the cost has been about £26,000, exclusive of site.

Mr. Moss, the owner of two houses (225 and 227) in Arlington-road, Camden Town, was summoned to Marylebone Police-court on Wednesday, at the instance of the St. Pancras vestry, on the ground of the drainage of the houses causing them to be dangerous and unfit for human habitation. For the defence it was contended that the combined drainage of the two houses was not a drain, but a sewer, and that consequently the vestry was responsible for its condition and repair. The magistrate dismissed the summons, and allowed the defendant three guineas costs, remarking that it was incumbent on the sanitary authority to do all that was necessary.

MEETINGS FOR THE ENSUING WEEK.

Wednesday.—Carpenters' Hall. Lecture to Students in Sanitation, by Professor H. Robinson. 8 p.m.

Friday.—Architectural Association. Annual address, by the President, E. W. Mountford. 7.30 p.m.

CHIPS.

The Great Western Railway Company's engineers are engaged in pegging out the land required for the construction of the Avonmouth and Severn Tunnel Junction Railway.

A new clock has just been fixed in the parish church of Newland, Gloucestershire, which strikes the hours, chimes the quarters, and shows the time on a 6ft. dial. The whole of the work has been carried out by John Smith and Sons, Midland Clock Works, Derby, who made the clock of St. Paul's Cathedral.

Deepcar Church was reopened on Saturday. The additions to the church have been principally erected at the expense of Mr. C. Macro Wilson, and include chancel, organ-chamber, vestry, and new pulpit, while the parishioners have subscribed for the south aisle.

At the meeting of the A.A. Camera Club to be held on Monday week, Oct. 29, at 56, Great Marlborough-street, W., at 8 p.m., a lecture will be given on "The Frena Hand-Camera and its Special Suitability to Architectural Photography," by Mr. Fred O. Bynoe.

The new church schools, Gosport, are being warmed and ventilated throughout by means of Shorland's patent Manchester grates and patent exhaust roof ventilators, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Committee of the Sunday Society have decided upon the first Sunday in December as the date for Museum Sunday this year, which will be the third occasion on which a Sunday has thus been set apart for advocating the objects of the Society from the pulpit.

The memorial stone of the new buildings now being added at the rear of Burlington Sunday-schools, Ipswich, was laid on Monday. The addition provides infants' school and classrooms, and is connected with the old building by a corridor and staircase hall. The chief room is 25ft. by 20ft., and there are also a ladies' room, 22ft. by 16ft., and five new classrooms. By moving the revolving shutters between classrooms a hall 41ft. by 18ft. is available. Messrs. Eade and Johns, of Ipswich, are the architects, and Mr. E. Catchpole is the builder. The cost will be about £1,300.

The infirmary to the Isleworth Union will comprise eight wards, about 70ft. long by 24ft. span. Mr. W. H. Ward, of Birmingham, is the architect. The whole of the floors will be fireproof on the Fawcett system. The smoke-flues will be carried in the thickness of the floor.

The Baths Club, Dover-street, Mayfair, W., which will shortly be ready for the reception of members, is novel as far as London is concerned. The object of the club is to afford its members accommodation for swimming and gymnastics, and also for Russian, Turkish, and other baths. Those parts of the building which contain the dining, reading, smoking, billiard, and bedrooms (40), while communicating with, are distinctly separate from, the baths and gymnasium. The building has been erected by Messrs. J. Allen and Son, of Kilburn, and the whole of laundry machinery has been supplied by Mr. Harper Twelvetrees, of London and Manchester. The total cost of the works has been about £70,000. The architect was Mr. Collins B. Young, of Cockspur-street, and Mr. Donald Milne his clerk of works.

The town council of Crewe have decided to give £800 for a site of land in Richard Moon-street, whereon to erect an art school costing about £5,000, and to acquire five acres of land at Coppenhall to erect thereon an isolation hospital costing probably about the same sum.

New board schools are being erected in Church-road, Lowestoft, at a cost of about £7,500. Mr. G. E. Hawes, of Lowestoft, is the contractor.

New board schools are being built at Ross, Herefordshire. Mr. A. H. Pearson is the architect, and Messrs. J. B. Kemp and Son are the builders.

Another ambitious undertaking was entered upon by the Blackpool corporation on Tuesday. Three large estates to the north of Claremont Park, embracing The Cliffs and over 160 acres of land, are to be purchased at a cost of £32,500, and it is intended to construct a new promenade and carriage drives, with a view to adding a new and extensive suburb to the town.

The underground portion of the Walthamstow and Epping Forest Railway will be constructed on the Greathead shield principle. This is the only line that is authorised to use either steam or electricity.

Trade News.

WAGES MOVEMENTS.

The Building Trades.—The monthly report of the Labour Department states that most branches of the building trades continue well employed, though a slight falling off is observable with carpenters and plumbers, with the result that the percentage of unemployed in the Unions connected with this group of industries has risen from 3·4 to 3·6. The furnishing and woodworking trades are, as a rule, fairly busy. The percentage of unemployed in Unions concerned is 4·7, compared with 4·8 at the end of August. The number of new disputes in September shows a decrease compared with the preceding month, 69 having been recorded, as compared with 86 in August and 54 in September, 1893. Of these 69 disputes, 12 occurred in the building trades.

Glasgow.—The plasterers' labourers are still on strike for an increase from 6d. to 6½d. per hour.

Liverpool.—A social gathering of the members of the National Association of Operative Plasterers and the Liverpool Local Society of Operative Plasterers was held on Saturday evening at Thredder's University Hotel, Brownlow-hill, the object being to bring about the amalgamation of the local with the National Society. Mr. Arthur Otley, general secretary of the National Society, came down from London to preside, and was supported by Messrs. J. Gough, president, and O. Roberts, secretary of the Liverpool branch of the National, and R. King, president, and J. Kenny, secretary of the local society. A large number of the trade were present. After dinner, the Chairman and Messrs. Roberts, King, Gough, Baldwin, and others spoke in favour of the scheme proposed, which was adopted.

DOULTING STONE.
CHARLES TRASK & SONS.
DOULTING, SHEPTON MALLET.
London Agent:
E. A. WILLIAMS, 16, Craven Street, Strand, W.C.

FAMBRINI & DANIELS,

High Wycombe.—For alterations and additions at the Cross Keys p.h., High Wycombe, for Messrs. Leadbetter and Bird. Mr. Arthur Vernon, 29, Cockspur-street, London, S.W., and High Wycombe, architect :—

Barker, Kensington	£695	0	0
Nash, Wycombe	542	0	0
Loosley, Wycombe	490	0	0
Gibson, Wycombe	448	0	0
Hunt, Wycombe	393	0	0

High Wycombe.—For the erection of new hotel, with outbuildings, &c., in Green-street, High Wycombe, for Messrs. Leadbetter and Bird. Mr. Arthur Vernon, 29, Cockspur-street, London, S.W., and High Wycombe, architect :—

Barker, Kensington	£1,490	0	0
Boyle	1,450	0	0
Harris, Bolter End	1,361	10	0
Smith, Lane End	1,340	0	0
Hunt	1,287	0	0
Dickens	1,266	0	0
Loosley	1,237	0	0
Nash	1,235	0	0
Harris	1.200	0	0
Flint	1,167	0	0
Gibson (accepted)	1,140	0	0

(Rest of Wycombe.)

Holborn.—For heating works at St. Luke's Workhouse, City-road, E.C., for the Guardians of the poor of Holborn Union. Mr. A. Saxon Snell, F.R.I.B.A., 22, Southampton-buildings, Chancery-lane, W.C., architect :

Comyn, Ching, and Co., Long Acre	£1,294	3	0
Defries & Sons, Houndsditch, E.C.	1,191	0	0
Waller & Co., Fish Street-hill, E.C.	1,160	10	0
Kite and Co., Euston-road, N.W....	976	0	0
Purcell & Nobbs, Cleveland-street...	973	0	0
Benham and Sons, Wigmore-street	951	0	0
Vaughan and Brown, Kirby-street	950	8	0
May, J. and F., High Holborn ...	918	0	0
Clarke, J. F., and Sons, Moorgate-street, E.C.	750	0	0
Moorwood, Sons, and Co., Southampton-street, W.C.	550	10	0
Strode and Co., Osnaburg-street, N.W. (accepted)	497	0	0

Homerton, E.—For erecting a chimney-shaft in connection with the new boiler provided at the Upton House Industrial School, Urswick-road, Homerton, for the London School Board :—

Nightingale, B. E., Albert Works, Albert Embankment (accepted)...	£258	0	0

Lambeth.—For providing hot-water coils and radiators with small boiler, for hall and two classrooms at South Lambeth-road School, for the London School Board :—

Ellis, J. C. and J. S.	£115	0	0
Maguire and Son	112	0	0
Pearson, R. H. and J.	110	0	0
Russell and Co.	104	15	0
Wontner-Smith,. J., Gray, and Co.	94	0	0
Berry, Z. D, and Sons	88	0	0
Clarke, J. F., & Sons, Featherstone-street, E.C. (accepted)	83	0	0

Limpsfield.—For excavations and foundations of the Caxton Convalescent Home, Limpsfield, Surrey. Mr. A. Saxon Snell, F.R.I.B.A., architect. Quantities by the architect :—

Durtnell, R., Brasted	£501	7	4

Llanishen.—For lodge and stables, Llanishen :—

Cough Bros.	£1,070	0	0
Dunn, C. C.	1,050	6	0
Symonds, W., and Co.	1,029	10	0
Best, W., and Co.	1,025	0	0
Cox, R., and Bardo	995	14	8
Gibson, J.	980	0	0
Luke, E. M.	940	0	0
Evans, E. R., and Bros. (accepted)	938	0	0

(All of Cardiff.)

London, E.—For providing small low-pressure hot-water apparatus at Monteith-road School, Tower Hamlets, for the London School Board :—

Purcell and Nobbs	£87	10	0
Vaughan and Brown	63	10	0
Parsons and Harris	60	10	0
May, J. and F., High Holborn* ...	57	10	0

* Accepted.

London.—For the extension of the staff quarters, laundries, &c., at the South-Western Fever Hospital, Stockwell, for the Metropolitan Asylums Board. Mr. T. W. Aldwinckle, architect. Quantities by Mr. W. T. Farthing :—

Kerridge and Shaw	£29,009	0	0
Lowe, R. A.	28,930	0	0
Edward and Medway...	28,923	0	0
Wallis	28,354	0	0
Lorden and Sons	28,027	0	0
White and Son	27,579	0	0
Higgs, F. and H. F.	26,582	0	0
Kirk and Randall	26,140	0	0
Proctor, E.	25,295	0	0
Johnson, W., & Co., Ltd. (accepted)	24,300	0	0

London.—For repairs and decorations to the Crystal Tavern, Burdett-road, E. Messrs. C. Foulsham and H. Riches, Bromley-by-Bow and Crooked-lane, City, architects :—

Osborn, T. and Sons, Lower Thames-street, E.C. (accepted)	£205	0	0

London.—For new drainage at Guilsfield, King's-road, Clapham-park, S.W. Mr. H. Riches, 3, Crooked-lane, London, E.C., architect :—

Osborn, T., and Sons, Lower Thames-street, London, E.C. (accepted ...	£104	0	0

London, S.E.—For removing and re-erecting on the site which has been hired in Rollins-street and Sharratt-street (on the north side of the Canterbury-road site, Old Kent-road), two of the iron buildings now standing on the Basing-road site, Peckham, for the purpose of providing temporary accommodation, for the London School Board :—

Croggon and Co., Limited	£588	10	0
Cruwys, T.	559	0	0
Harbrow, W., South Bermondsey*	520	0	0

Accepted.

HOW FAR IS MODERN PROGRESS REAL?

EVERY age and every country has its own special Mumbo Jumbo, before which the common herd are expected to fall flat, "breathless in adoration." Sometimes it is a man, sometimes it is a body of men, and sometimes, again, it is a system of doctrines and practices. And in every age and country, too, rudely inquiring minds arise, who do not take the Mumbo Jumbo of the period at his worshippers' valuation. They want to bring him into the daylight—to see what he is made of—to find out how much of him is real, and how much is mere stuffing and padding. But this would never do. He will not bear too close an inspection, and intruders must beware. At some periods they are disposed of by being burnt at the stake; in others, they are turned over to the hangman. In Africa, it is said, they die mysterious deaths, and in civilised countries like England they are usually deprived of the means of living, so that the same result occurs, without a definite responsibility for it resting on anybody.

Now the Mumbo Jumbo of our land and our century has been called Progress. It has many aspects; but in this place we have chiefly to do with its physical and material aspect. Is this aspect really as noble, as beautiful, as altogether admirable as its votaries represent—in short, is it all real progress, or is it partly a movement which the next or some other century will have to reverse? There is nothing uncommon in such a change of direction. Fifty years ago, the whole tendency of English legislation was to do away with rules and regulations. The popular ideal then was unbounded liberty for all, with a policeman here and there just to keep order. The popular ideal now would leave liberty to no one. Laws and by-laws are accumulating, till the world will soon not be able to contain them; and pains and penalties are multiplying, till there will not be a living man on whom some of them have not been, or might not have been, inflicted. Both these ideals can hardly be right. If unfettered liberty is the proper thing, the present process of turning the world into a sort of model prison must be a mistake; and yet our fathers, who advocated the one, and our contemporaries, who are advocating the other, are alike in the consciousness of their own infallibility. If there is little else they would agree in, they could both sing in chorus, "We are the people, and wisdom will die with us." If there is one thing which both have always been quite sure of, it is that they are promoting Progress. Yet the man who stands a little out of the crowd, and looks at the track left by the movements of the last two or three generations, cannot help thinking at times that much of it has been a progress there and back: an advance like that of the general who, "with thirty thousand men, marched up the hill, and then marched down again."

Let us turn to details. In these, very often, there has not yet been the same grand reversal of policy. A straighter course has so far been steered; but the question is, whether that course has always been the best one, and whether it can or should continue. Take an example from the sanitary work in our cities. Here much good has been done, and also much evil. There is no town now like the Edinburgh of 1750, if we may trust Smollett's description of it. The Edinburgh people then had not got even as far as cesspools. Latrines there were none. The slops were flung into the streets after dark. It was customary for the flinger to caution passengers by previously crying "Gardy loo!" a phrase supposed by some to signify, "Lord have mercy on you," though it was perhaps only a corruption of the French *Gardez lieu*. Even the digging-out of receptacles for sewage was an advance on this primitive state of things—at least, as far as comfort and cleanliness were concerned. Whether it was also an advantage in healthiness is not so certain; here, perhaps, there was little to choose between the two modes of disposal. At any rate, the cesspool system everywhere proved bad enough. It was condemned, and drainage took its place. Then, in all parts of the country, and for many years, it was quite the correct and regular thing to make the drains run into the rivers. This was Progress in one aspect, while Progress in another aspect was busy in supplying the towns with water taken from the very rivers they drained into. A few fastidious people objected to this arrangement. But it might have been long before they gained the public ear, if Nature had not kindly sent the cholera to support their arguments. A great London water company was good enough, while cholera was present, to try the experiment of giving its customers diluted sewage to drink. They died by thousands, while people supplied by other water companies only died by scores; and so at last it has become a recognised fact that house-drainage is unsuitable to general consumption.

So far, no doubt, progress has been real, though slow. Look, however, at another side of the matter. We have got rid of visible filth, like that of 18th-century Edinburgh; but we have done it by establishing under foot an all-pervading circulation of deadly gases which pollute the air at every street-corner, and which, in spite of precautions, continually find their way into our houses, and lay a foundation for all sorts of diseases. By expending millions upon millions of money we have turned the very earth into a hotbed for breeding typhoid, diphtheria, and many other pestilences, and then, as a further advance, we set up what is called "sanitation," which is mainly an attempt to save us from the fruits of our own devices. We have cleaned the outside of the cup and the platter, but have made the inside so foul that it imperils our very lives to touch it. In towns our sewer system poisons the whole atmosphere. True, its vapours are diluted. We do not smell gaseous sewage in every breath we draw, any more than we tasted liquid sewage in every drop we drank; but there it is all the same. And we meet with it in a concentrated and unmistakable form dozens of times every day—sometimes at home, always abroad. Wherever a foot-passenger has to wait at a crossing, there, by the wisdom with which we are governed, he finds a sewer grating to envelop him with reeking stench. Wherever there is a crack or a cranny in the pipes of his house, the same disgusting odour issues out and assails him. If he is a tenant, he is in frequent misery through the necessity for removing stoppages and doing repairs; and if he is a landlord, half his income is thrown away in paying for them. And if, in either case, he complains, he is threatened with being called an enemy to Progress. For this belief in Progress, to its votaries, is a religion, and religions have to be taken as they stand, and swallowed whole. It is not permitted to pick and choose, to take this part and reject that. If, therefore, you would not be counted a heretic, and treated as one, you must stop your nose to sewer gas. You must glorify the advance of "sanitation," and be sure not to hint that nine-tenths of it would never have been needed if Progress had only devised a reasonable, instead of an unreasonable, way of getting rid of domestic refuse; if, in short, it had all been real progress, and not "two-fifths improvement and three-fifths sheer fudge."

This generation, probably, will see no marked advance here. The "sanitators" are too numerous. There must be scores—perhaps hundreds—of thousands of people with a vested interest in sewer gas. Imagine it done away with, and consider the ruinous result to inspectors, surveyors, manufacturers, and workmen—honest people enough, and necessary as things are, but necessary to a large extent only because things are what they ought not to be. A great evil has been set up, and without blame to them a great many people's livelihoods have come to depend on its continuance. Therefore, any lessening of it is likely to be slow. Time was—at its first appearing—when it might have been removed with little trouble and little loss to anybody; but Progress "must be doing." Unlike progress, it does not think twice before it acts once. It is nothing if it cannot make a show and lay out a bit of money, and in doing these two things it has landed us where we are.

Our last example showed a physical good gained, at the cost of a great physical evil. Everybody can understand that such an advance as that is not much to boast of; and the only way of defending it is to pretend that the evil was inevitable. But there are other departments of Progress in which material benefit is being secured, not so much by material as by mental loss. If the things of the mind come into conflict, or even look for a moment as if they were coming into conflict, with the things of the body, modern Progress loses no time in setting its foot on them. The air is full of talk about Christianity and Spirituality, and the elevation of the masses; but when it comes to action, the people who boast of being only a little lower than the angels conduct themselves as if they were barely a little higher than the beasts. To some extent this is a reaction. Centuries ago, the world went to the opposite extreme. They thought to benefit their souls by injuring their bodies. Now they are trying the very reverse of this. In most departments the material counts for everything, and the mental for nothing. Instead of the mortification of the flesh, we have taken up with the mortification of the spirit; and there is a terrible outcry if the smallest material advantage is given up to secure mental satisfaction.

Compare, for instance, our modern streets with those of any picturesque old town. How very convenient they are—and how unutterably wearisome! What wonderful Progress they exhibit, as they run on for mile after mile without change or break. For it is only we—as it would seem—who have discovered that a straight line is the shortest distance between two points. This truth, hidden from ages and generations, has lately been revealed to us, and we look back with scorn on our benighted predecessors, who hardly seem to have had a suspicion of it. And yet it is possible that these benighted people knew very well what they were about. They lived in their cities, and tried to make them worth living in. Monotony was abhorrent to them—as it is to everybody with healthy tastes—and they got rid of it at the price of walking a thousand yards in a beautiful street instead of nine hundred and fifty yards in an ugly one. We are wiser. There is not a vestryman in London who would vote for the extra fifty yards, even if they made Oxford-street a match for the High-street of Oxford. "I believe in utility," says this practical person. Very good; but what is utility? Is there any utility in forcing men to do their work in hateful places, amongst depressing surroundings? Does any man do more work, or better work, under such conditions? Is anyone at his best, even as a machine, when the dreary mechanicalism with which he is shut in makes him instinctively ask whether life is worth living?

The very Londoner who has helped to make London what it is has to run away from it, or die of dreariness. Like Macbeth, he seems to say, "I am afraid to think of what I have done; look on't again I dare not."

What is true of modern streets is true—with a percentage of exceptions—of modern buildings. Our real architects, indeed, however they may differ in other ways, are all free enough at present from any leaning to monotony. Not for centuries has there been so much freshness, so much variety, in the real architecture of the period. But the misfortune is that there is so little of this. The pseudo-architecture of the time is what fills our towns, the work of the speculative builder, and the machine-like surveyor. Their only aim is to produce the maximum of show with the minimum of trouble. What they call a "design" is a mere stock pattern, which they have used a hundred times before, and mean to use a hundred times again. But whereas, in former times, it was a plain pattern, and so far inoffensive, it now aims at being a decorated one, and becomes aggressively vulgar. They cannot leave it in its native homeliness; they stick it all over with ill-copied and misplaced details of some fashionable style, which improve it as much as the barrister's wig and the Wellington boots improved the African chief in the story. Yet here, again, we are commanded to fall down and worship Progress, who is doing these wonderful things for us; and if we do not, we are told that it is all jealousy, and that architects can never see any good in each other's work.

Once in a lifetime we get a new Building Act. And once in every year or two we get some Act, or part of an Act, which more or less bears on building. The object of all this legislation is to make buildings safer and sounder and healthier to live in: three excellent purposes to aim at, unless, as Burns says, we "buy the joys too dear." These columns are hardly the place in which to show how ruinously such regulations may affect perfectly blameless persons. The public are learning how much easier it is to sacrifice an individual here and there, than to pay for what it wants; and people who read with horror how some savage tribe has offered up a child to stay a pestilence or end a drought, will cheerfully join in destroying a widow or an orphan whose whole income arises from property which an awkward national conscience has suddenly decided to do away with. So slums are pulled down, and artisans' dwellings built: both good works, if honestly done, though it is unfortunate that the people who lived in the slums do not move into the dwellings, and that one result is often to overcrowd still more the slums which remain. The slum problem, like the sewage problem, is surely not past the wit of man to solve; but neither have been solved yet, and till they are, some of us will find our worship of Progress impeded by sad suspicions.

There is nothing, assuredly, in the widening of our thoroughfares, the structural improvement of our houses, or the throwing open of crowded areas, which should make our towns less fit to live in. These changes themselves should act in the very opposite direction, and would do if they were carried out by free men. It is the machinery which strangles us. On all sides we are met by "Thou shalt not," till it becomes our main business to find what is still left that we may do. The spring and spontaneity is being ground out of our lives: we all spend our days in working a vast machine which threatens to crush each man who neglects it for an instant. In a complex state of society like ours, rules and regulations are, of course, inevitable. But they should be so framed as to leave all possible liberty in non-essential matters; and they should not have the effect of setting up a multitude of petty tyrants amongst us. Something was said on this matter at the recent Public Health Congress; and much more is likely to be said, if the present abuses continue.

If mechanicalism thus has us in its grip throughout our work-a-day life, there is the more reason why, on Sundays at least, we should get away from it. There might be one day in the week on which it retired into the background, and left us to the natural, the beautiful, and the free. But, alas! it haunts our churches as well as our streets. Mr. Richmond, A.R.A., in his paper at the late Church Congress did not say a word too much about its frequent intrusions. Stained glass, carving, sculpture, church furniture of every kind are turned out wholesale in the spirit of the pushing tradesman—partly by machines, and partly by machine-like workmen. We architects know very well in whose buildings this lifeless, worthless trash will be found, and from whose it will be rigidly excluded. But the public do not know. They cannot be made to understand that there are architects *and* architects. Pugin and Street, whom Mr. Richmond mentioned, have had worthy successors; and better church decoration has been produced in recent times than ever before during the Gothic revival. But a large part of the world cannot appreciate it, and another part scarcely knows where to go for it; and so the shoddy-decoration manufacturer drives a roaring trade in the very temple itself. And the people who prophesy smooth things say that it is all well: the churches used to be shabby, and now they are smart; and if this is not Progress, they would like to know what can be!

TWO PHASES OF ARCHITECTURE.

WE believe it was Emerson who said, "There is properly no history, only biography." What he meant was that every man must know the whole lesson for himself and go over the whole ground. Probably such a dictum will explain why it is that in the course of thirty or forty years our architectural development has gone through a cycle of change corresponding with the evolution of a man's experience, and, as every youth is a copyist, more or less, so the earlier years of the epoch are noted for the design and execution of buildings bearing the traces of archæological research and minute literal reproduction. These buildings possess many marks of merit and of careful attention to detail; but they bear the stamp of men, Greek and Gothicist, who had not perceived the practical adaptation of structures to their several wants. They seem only to be passing the first stage.

A comparison of our recent building with those erected, say, a quarter of a century ago, cannot fail to be instructive, if not edifying. Many changes have been wrought. Looking back 25 or 30 years, we seemed to be entering on a new phase of art. An enterprising school of architects were then rising into notice, inspired with a new mission. The Gothicist was beginning to lose ground, and his place was threatened by the disciples of another revival, equally enthusiastic, who declared that Gothic, like its predecessor, had been played out, and that our own vernacular 17th-century style supplied us with a more common-sense mode of building than either Classic or Gothic. The battle between Gothicists and Neo-Classicists, or "Queen Anneists," as some of the new school were called, waxed hot and strong for some time. It was never believed by many that the taste of the Dutch, with all its vagaries, would or could ever supplant the purer and more dignified styles that had been in vogue for so many years, or that the "Queen Anne" style, with its innumerable conceits and grotesque quaintness, could possibly succeed. Time has shown what a fickle thing public taste is: that what one generation regards to be the truth, a successive one disputes; even such a matter as religious belief itself, unless fixed by dogmas that are repudiated by many, is constantly changing; and customs regarded and esteemed by many in the 18th century are now held up to reproach and ridicule. Has not that whirligig of Time shown us so many strange things, both in our domestic and religious customs, that when we come to think of them we cannot be surprised at anything? We have only to compare our churches and chapels now with what they were a few decades ago, the change in form of building and ritual, in the use of organs and choirs, in monumental art, in epitaphs, in matters of decoration and detail, to see how completely we have accepted what our forefathers abjured and despised. After these whimsical changes in ecclesiastical matters, we can no longer be surprised at the reappearance of quaintness and drollery in other directions, as in our secular and domestic buildings, once so repugnant to our tastes. We had our purists, no doubt, who tried to bring back the styles of the 13th and 16th centuries, the Classic architecture of Greece and Rome; but there were others who had sedulously been trying to winnow out the wheat from the chaff, and endeavouring to point to principles that underlay those styles, and to them the change was regarded as rank heresy.

One of the salient notes distinguishing the age of which we speak from the present was the greater attention to style and purity of detail. Comparing buildings, like many designed by the late Sir Gilbert Scott, as St. Giles's, Camberwell; Doncaster Church, the Broad Sanctuary, Westminster; the St. Pancras Hotel, or those of Mr. Butterfield—All Saints', Margaret-street; St. Alban's, Holborn—with those of our present ecclesiastical and semi-ecclesiastical buildings, we are obliged to notice the fact that their authors studied the best and purest models of mediæval times, that they gave special attention to the forms and details of their edifices. In opposite directions, the late W. Burges and Mr. Norman Shaw exhibit the quainter aspects of Gothic and Queen Anne. All students know Burges's grotesque but artistic house at Melbury-road, Kensington, with its quaint fireplace; and Norman Shaw's New Zealand Chambers, Leadenhall-street, and his Lowther Lodge, Kensington; both were sticklers for style, though they managed to infuse into their work an individuality of their own. The latter type has outbid the Gothic in popular preference. Burges's style was a little too Mediæval and archaic for popular tastes. "Queen Anne," on the other hand, appealed to the homely feelings of Englishman, and was a pleasing reversion from the cold and formal Classic o the preceding age. Gothic, as we know, was ill suited to domestic or business purposes, and every attempt to secularise it, in the hands of the purists, was more or less a failure. It seldom accommodated itself t interior wants at that time, because the architect endeavoured to make the plan and the features suit some model or conform t a precedent.

The chief note of our modern architectur is greater attention to plan and interio detail. The principle of accommodation t requirements is the chief concern with th architect of to-day; his craving for style for the correctness of his mouldings, i secondary to providing good arrangement and to seeing that his buildings are fitte with the most approved details and appli ances. His attention is turned from follow ing styles to seeking those artistic principle of which the styles were the product. W do not say he has done so everywhere or ha succeeded always, but the general aim is th right one if pursued without any selfis desire. The architectural literature of th period we are discussing points in the sam direction. Papers and addresses on sty are now rare; in their place we have practical subjects connected with professional practice, craftsmanship, building legislation, school building, and educational questions. Books on special branches of planning and construction are much more numerous than they were formerly, and the professional mind is confining its attention mainly to particular details and branches, not to periods; not so much to the facts of history as to principles and types. At no former period has so much attention been given to the theory and practice of construction, technical matters, sanitary and hygienic questions, heating and ventilation, to materials, notably iron and concrete, new processes and appliances, principles of design and decoration. These have had a considerable influence over modern buildings.

The public have demanded essentials, well-planned and healthy buildings; and if we look at our principal edifices built within the last few years, it will be seen that they possess those qualifications to a degree unknown to buildings of a similar kind erected a quarter of a century ago. Comparing them with those, we cannot fail to observe that the intention of the designer has been different. Attention has been turned to a very different set of conditions, to plans devised not to make elevations Greek, or Roman, or Gothic, but to satisfy actual wants; to the use of materials dictated not by desire to follow a style, but to be suitable to their position; to ornament, not imitative of any past period, but appropriate to its destination. The spirit of copyism has disappeared with the advent of a truer method.

One other thing we observe. In the earlier days of the period to which we have gone back, literalism and purism completely stifled independent thought. At the present day there is the "personal equation." We are not quite sure whether this "personal factor" has been a gain or not; many, at least, think it has. It has encouraged invention, and has certainly, in the hands of a few eminent men in the profession, stamped our architecture with a character of its own. It has given us our New Courts of Justice, the Manchester Town Hall, the Birmingham Assize Courts, the Imperial Institute, and a score of other edifices, Gothic and Renaissance in their details, but infused with the artist's own individuality. Under the older order we had buildings like the Houses of Parliament, historically accurate in their details (whose architect, by the way, was also equally known for his Travellers' and Reform Club Houses), an edifice clothed with the most faultless 16th-century style an expert Gothicist could reproduce. Personality has given a new impulse to design. The author discloses himself while keeping within the guiding lines of a particular style; he thinks out for himself certain details, or introduces diverse features. He can take a gable or an arcade from Hatfield or Holland House, a window from Bramshill or Longleat, or he can blend the Gothic spirit with the severer details of a Classic building, and thereby he can widen the scope of his art, as some of the more enthusiastic followers of Norman Shaw have done, so that we can sometimes scarcely say whether the design is more of the one than the other style. This "leave and license" was foreign to the earlier period. Whether we can say that architecture has benefited by these admixtures or not is a rather difficult question just now. But the spirit has broadened art, and has permitted it to accommodate itself to a larger variety of uses and materials.

The freer use of materials is another thing which distinguishes our present architecture from that of the past. We not only employ more materials, but treat them in a manner unknown a few years ago. Brickwork, for example, was chiefly used as a wall-facing with stone dressings; it is now, in combination with terracotta, employed decoratively. We now design in these materials, whereas we formerly only built with them. Iron is more extensively employed, and in a manner that suggests its further development as an architectural material, whereas not long ago it was confined to girders and columns. Clay products and ceramic decoration have created new industries. In those branches of building construction which contribute to comfort, sanitary and hygienic objects, as in lifts, warming and ventilation, the modern building is far in advance of its predecessors. We can make our walls damp-proof, our roofs and floors weather-proof and sound-proof, by the use of materials like asphalte and slag-wool. The electric light has been applied in a variety of forms. We do not pretend to say all these applications of modern science have been utilised with a corresponding degree of success; we merely point to them to show the development that has been made in the direction of making our buildings convenient and comfortable, instead of merely representative of a past age.

ALTERATION AND READAPTATION OF BUILDINGS.

THE very common practice of making one building serve for a purpose quite different to that for which it was designed and built, is carried on to a large extent in London. A street is altered in its character in the course of a few years, and those houses which formerly let as dwellings are converted into shops, or the trade may go into another channel, and the shops may give place to offices of different kinds. By such-like alterations the buildings are useless for their original purpose, and it becomes necessary to pull down and rebuild, or to alter them. The latter is the more inexpensive operation, and it is often undertaken without the slightest suspicion that the structure is radically and structurally unsuited for the purpose it is intended to change it to. Fortunately the Building Act prohibits any ill-adapted change of this kind, and there are two sections which expressly provide for both uniting buildings and the conversion of houses into public buildings. Notwithstanding these provisions, there are many possible alterations which can be made to evade the law. The joining of several private houses into one shop is a process seen every day in London. If there were as many separate risks, entrances and exits to the united block as there were before the separate houses were joined, there would be little to object to; but uniting several dwelling-houses means often one entrance and one stairs and the reduction of conveniences generally. The chief object is to make room for one large shop on the ground floor. It is evident the process can be carried too far and at imminent risk to the health and safety of those who inhabit the building, as there have been abundant examples to prove. The necessary alterations can be carried on piecemeal, one house at a time, till a large block is converted, in which the statutory cubical space is exceeded and we have a dangerous form of structure with upper floors cut off from ready access to the lower. In the near future this kind of reconstruction will be rendered almost impossible. There is a clause in the present Act which says that "No buildings shall be united unless they are wholly in the same occupation,"—a clause which by itself does not prevent one man from buying several dilapidated houses and turning them into one. It does not much matter whether a large united building is in one occupation or not, as far as danger is concerned—indeed, we may even suppose it would be safer in two or more occupations. The next clause is much more useful in preventing these alterations. It says: "No buildings shall be united if, when so united, they will, considered as one building only, be in contravention of any of the provisions of this Act" (18 and 19 Vict. cap. 122, sect. 28).

According to the new London Building Act, these clauses are retained, but slightly altered in wording. The first reads (sect. 77): "Buildings shall not be united except where they are wholly in one occupation, or are *constructed or adapted to be so.*" The additional words italicised make the clause more complete and more reasonable. By the existing section of the Act it does not matter whether the joined houses are adapted structurally for the purpose of single occupation or not, so long as they belong to one owner; it does not matter whether the staircases are removed or not; whether there are proper entrances made for the united buildings, or whether the sanitary conveniences are suitable for the purpose. At present the structural condition of the several houses that are united can be almost left as it is; the party-walls can be pierced with openings, and the old floors made to answer; but the words "constructed or adapted" will make it harder to convert in this easy fashion, and will impose the duty upon the owner of making his premises perfect and complete as a single building. The walls must be rendered thicker if necessary, the floors strengthened, and the means of access and egress made suitable for the premises.

There are, however, a few additions made to the old Act which defines how the openings in party-walls are to be made, and their dimensions and construction. According to these new provisions, except under certain conditions, no opening is to be made in a "party-wall or in two external walls dividing buildings which, if taken together, would extend to more than 250,000c.ft." This space is the maximum for buildings without openings in party-walls. We have here a limit set, large enough in all conscience. The present limit of cubic space is, as our readers know, 216,000c.ft., and is practically sufficient for most purposes. Why it has been increased by 34,000ft. is not very clear, except in the interests of owners. But even this large space may be exceeded under certain conditions which are now in force. One important addition made in the new Act to the size of openings in party-walls, which are not to exceed 7ft. in width by 8ft. in height, is to the effect that such openings taken together are not to exceed one-half the length of the party-wall on each floor of the building. That is, in a building, say, of 50ft. in depth from front to back wall, any openings in any floor must not exceed 25ft. This will insure that there shall be an area of party-wall between the united houses which will stiffen the external walls, and in case of a fire prevent the passage of flames from one house to the next; there will be brickwork, in fact, to stop its passage from floor to floor, even should the sliding-doors or shutters be open or burnt through. In the next clause, referring to the wrought-iron doors on each side of the wall, it is added "or wrought-iron sliding-doors or shutters, properly constructed, fitted into grooved or rebated iron frames." A new sub-clause provides that if the wall be not less than 24in. thick, the opening may be 9ft. 6in. in height. These conditions are required if the 250,000c.ft. are exceeded in the space thrown into one. Sometimes these united buildings change ownership, and cease to be in one occupation. When this is the case the openings made in party-walls are to be stopped up with brick or stone.

The conversion of houses into public buildings is of very common occurrence, as when assembly rooms and club-houses are formed out of old premises intended for private use. At the present time all such alterations or

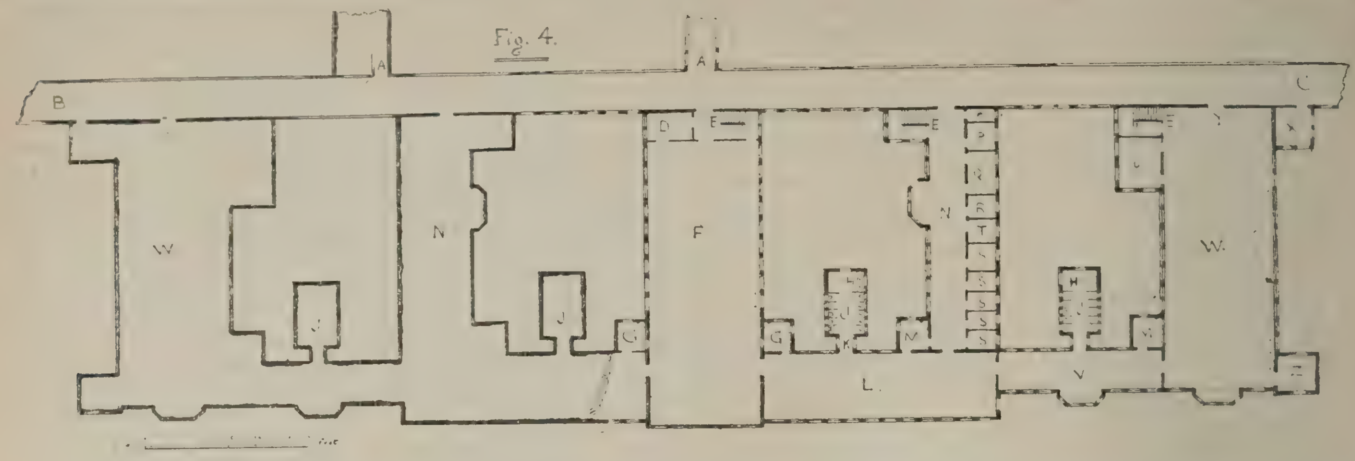

Fig. 4.

conversions are to be carried out under the direction of the district surveyor, or, if disagreed to, of the Council, but to what extent appears rather doubtful. These alterations are supposed to be carried out within the meaning of the Building Acts and amendments as applicable to public buildings. The walls, roofs, floors, galleries, and staircases are to be constructed as approved by the surveyor, and in such manner as though the alteration were the construction of a public building. In the new Act (79 sect.) it is enacted that, in the event of disagreement between the owner and district surveyor, the Tribunal of Appeal is to determine the question. The conversion of houses and other premises into public halls and assembly rooms is a matter requiring strict supervision. The new Building Act provides for such buildings, including churches and chapels. It lays down the rule that staircases for the public are to be inclosed by 9in. brick walls; that every staircase, corridor, or passage for public use shall not be less than 4ft. 6in. wide and 3ft. 6in. wide where not more than 200 persons are to be accommodated, and that every such staircase or corridor leading to a hall for any larger number than 400 is to be increased in width by 6in. for every additional 100 persons until a maximum width of 9ft. be obtained. The rules for exits from galleries to the street direct, and for doors and barriers to open outside, are important provisions to which we can only refer in passing. Under these rules it will seldom be possible to make alterations to buildings erected for dwelling-houses, that will adapt them to public uses, without considerable reconstruction and cost.

* * *

COUNTY LUNATIC ASYLUMS.—V.

By George H. Bibby, F.R.I.B.A.

WARDS FOR WORKING, QUIET, AND CHRONIC PATIENTS.

ONE of the leading conditions of success in the treatment of the insane is the sufficient separation of curable and incurable patients, for it is obvious that a close association of patients with very bad types of mental incapacity would delay or prejudice the possibilities of cure of those of whom there may be reasonable hopes of recovery.

It has long been recognised that the organisation of asylum-homes for incurables should be very different from hospitals for the management of recent and curable patients.

In the earlier attempts to reform the asylum system, new asylums were erected for the supposed curable cases, and the old institutions (which had been found, even then, wholly insufficient for the therapeutics of the day) were, with some alterations, converted into asylums for incurables. At the present time, however, all the various classes of the insane are usually to be found in one institution. Perhaps one of the reasons for this is the fact that the boundary between curability and incurability is very undefined; further, the transference of patients from a curable to a chronic asylum is said to have been not only inconvenient, but expensive.

On the other hand, it is not desirable that an asylum for chronic patients should be considered too strictly as being for those whose malady is hopeless; the wards must be fitted up and designed for the reception of old or chronic cases, who (though not frequently) may yet be occasionally relieved or even wholly cured. There is the further consideration that physicians might to some extent neglect the supposed incurables in the greater attraction offered by curable cases.

The chronic wards of an asylum must, therefore, be large in proportion to those for other classes, and it is to these that the management must be able to promptly dismiss all found to be (probably) past all cure, but only after every possible effort has been made to prevent the disease from assuming a chronic type.

The Commissioners in Lunacy suggest that the proportions of the various classes of patients may be arranged thus (with modifications in the cases of very large asylums and those for not exceeding 300 patients):—

Working quiet and chronic cases	40
Epileptic	20
Recent and acute cases	20
Sick and infirm	20
	100

The proportion of chronic patients is, however, often much greater than above indicated; for instance, in the proposed asylum at Warrington, for the Lancashire Asylums Board, the buildings are required to accommodate 2,000 patients—namely, 1,000 males and 1,000 females. This asylum is intended mainly for the reception of chronic lunatics and imbeciles, and will occupy the same position with regard to the Lancashire asylums that the asylum at Caterham does to those administered by the Metropolitan Asylums Board. It was, however, necessary in this case, in order to meet the requirements of the Commissioners in Lunacy, that provision should be made for receiving wards to accommodate 50 excited patients of either sex, and 200 sick and infirm of either sex, the total number of chronic patients being, therefore, 1,500. The promoters of this scheme directed attention to the fact that asylums of this kind "have been built at a cost of £100 per bed"; but this cannot have been anything near to the cost of recently erected asylums, and is probably much below that likely to be incurred, for such an asylum for chronics probably £130 or £140 per bed (even with economy) would be the cost per patient.

In arranging the plans of chronic wards, and those for working and quiet patients, the words of an eminent physician may be usefully borne in recollection: "Of moral remedies, proper employment of the patient seems to us the most important. In healthy work the innate desire of expressing and giving vent to its energies finds fullest satisfaction; by constant occupation in forming materials, the thoughts and efforts engross the mind and withdraw it from the empty longings and illusions of the imagination; the feeling of success again prepares the way for expansive sensations, and therewith self-esteem and confidence return. Therefore a steady employment of the patient, especially when voluntary, is rightly considered a decided indication of improvement, and is frequently the commencement of recovery."

The buildings for the working patients should be of a simple character, consisting chiefly of associated day-rooms and dormitories; these must be placed in connection with the washhouse and the laundry, and the sewing-rooms on the female side, and conveniently situated in reference to the workshops and farm buildings on the male side. These buildings may wholly or in part be of three stories; but the Commissioners in Lunacy require (or at all events suggest) that the uppermost story be devoted to associated sleeping accommodation for quiet cases, and that, as far as possible, each ward shall contain sufficient sleeping accommodation for all the patients for whom it is designed. As female patients usually preponderate, the plan should provide more accommodation for that sex than for males, and should be so designed as readily to admit of extension on either side. No ward should be arranged for a less number of patients than would, as a rule, require the services of more than one attendant.

County asylums occasionally afford some accommodation for paying patients, generally in detached wards or blocks within the precincts of the institution; but as the buildings are chiefly for the reception of pauper lunatics, all superfluous decoration should be avoided, both in the exterior and interior of the building, which, however, should be rendered as cheerful and attractive as due considerations of economy will permit.

In all county asylums it is necessary that there should be arranged for each class of patients a small ward in which newly-admitted patients may be placed under special observation, and in all asylums, dormitories, with a sufficient number of single rooms communicating, should be set apart and arranged for the care and supervision, during the night, by special night attendants of those patients requiring special treatment or care.

The Commissioners in Lunacy do not require that the proportion of single rooms throughout the asylum shall exceed accommodation for more than one-fourth of the patients. These would be chiefly in the wards for the excited and sick; but a few should be provided for special cases in the chronic wards, as well as for epileptics, &c. No *associated* bedrooms should be arranged for less than three beds, and the general height of each story should not be less than, but need not be more than, 12ft.

For clean and healthy patients the associated dormitories should provide a floor-space of not less than 50ft. superficial to each bed or patient, and the single rooms not less than 63 superficial feet. These are the suggestions of the Commissioners in Lunacy, who, however, state that "the space in the dormitories and single rooms of infirmary wards should be one-third greater than these dimensions. Doors of communication between two single rooms are found useful in a few special cases."

The day-rooms for chronic patients, of which there must be one attached to each ward, should provide for not less than 40ft. superficial for each patient, not including corridors of less width than 10ft. Where corridors of that or any greater width exist, the day-rooms may afford only 20ft. superficial for each patient, it being understood that a space equal to 40 superficial feet be provided for each patient in the day-rooms and such corridors combined. The day-rooms should be so arranged as to afford ready communication with the grounds and airing courts, and suitably near to water-closet and lavatory accommodation.

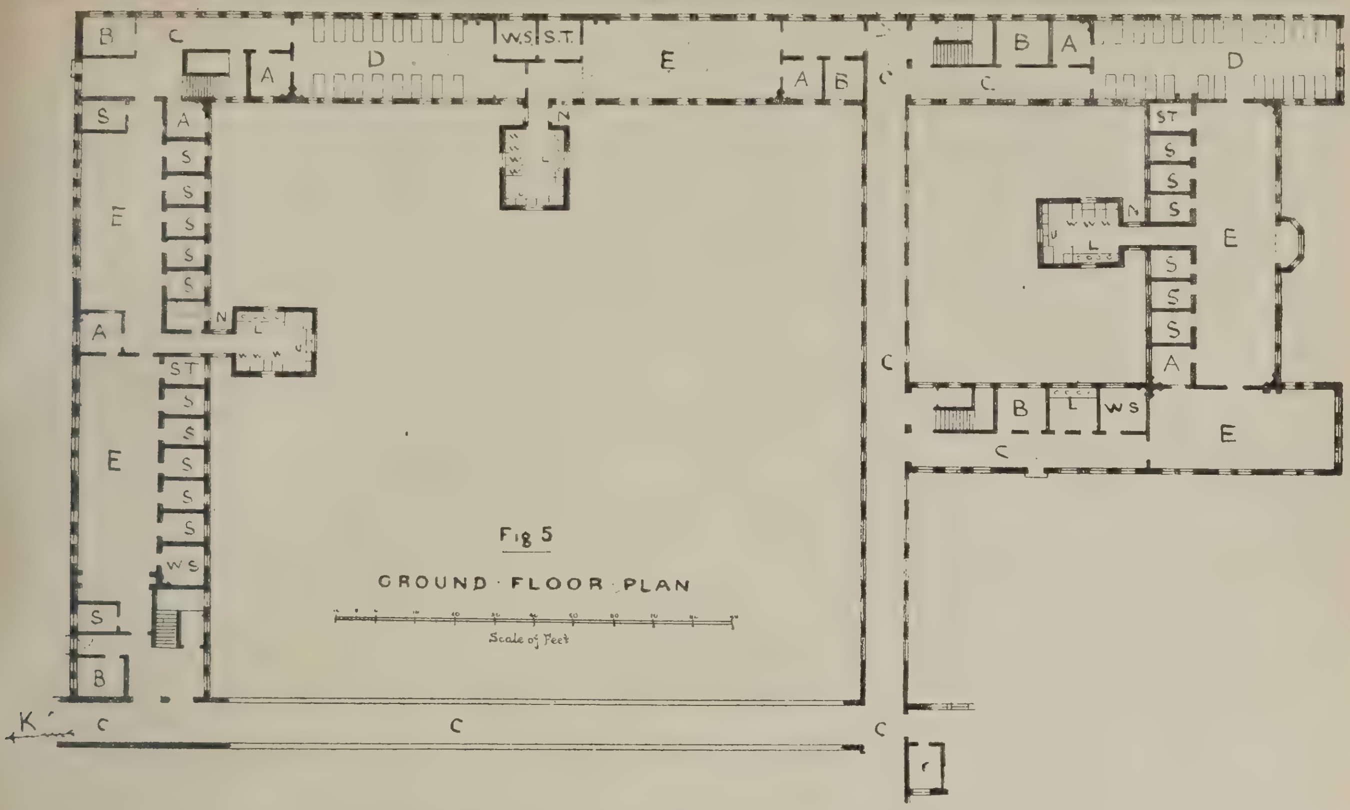

Fig 5

GROUND FLOOR PLAN

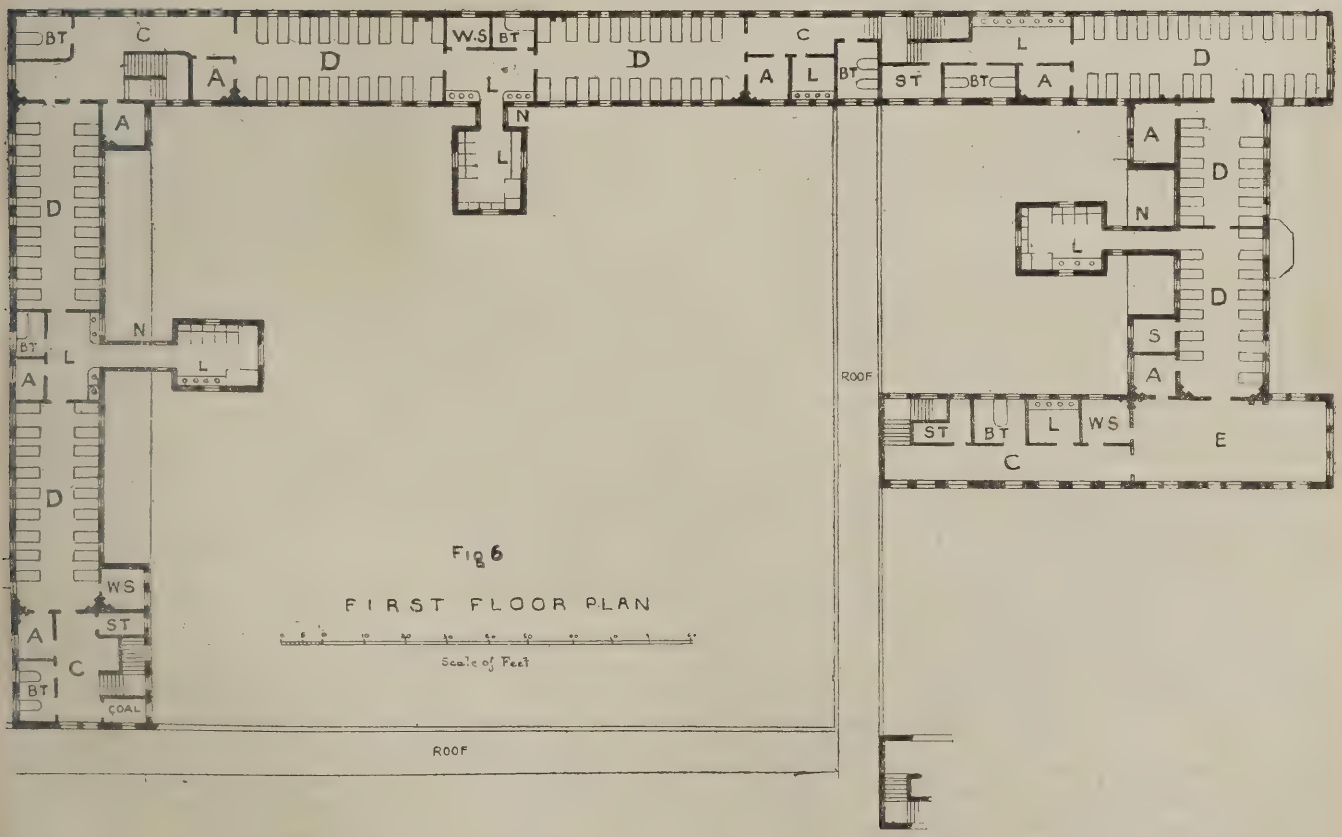

Fig 6

FIRST FLOOR PLAN

Whenever practicable, the bedrooms (for two or more attendants to each ward) should be placed *between* two associated dormitories, with glazed doors of communication with *each* (*vide* Figs. 4, 5, and 6); single attendant's rooms must have an area of not less than 100ft. superficial, while larger rooms are sometimes provided in some of the male wards for the use of married men and their wives.

The windows of the day-rooms and corridors should be large (with small panes, so as to reduce the cost of repairs occasioned by destructive patients), and not more than 3ft. 6in. from the floor. They should have wood sashes, double-hung, and be made to open easily so as to allow a free circulation of air, but so arranged as not to expose the patients to danger. The wall below the sills of windows in dormitories may be splayed, but in day-rooms and corridors may be recessed to admit of a seat, if desirable. In the dormitories and single rooms the windows should, as a rule, not be placed more than 4ft. from the floor; but in padded rooms the windows should be placed as high as possible, and when practicable, perhaps skylights would be desirable. The windows in all parts occupied by patients may be stopped so as to allow of being opened top and bottom 5in.

Many of the single rooms should be provided with strong, solid shutters, so constructed as not to admit of being forced open, or to afford opportunities of committing suicide by hanging.

The single-room doors should in all cases open outwards, and be arranged so that they may fold back close to the wall. Some of the doors should have an open panel 5in. wide in the centre of the door above the middle rail.

There should be a very ample arrangement of lavatory conveniences; these should be placed in the annexe for water-closets, slop-sinks, &c. It is most desirable that all water-closets, lavatories, &c., should be placed in these projecting buildings (*vide* Fig. 1), with a lobby about 5ft. wide, with cross ventilation separating the wards from the water-closets (*vide* Fig. 4, J J J J).

Each ward should also be provided with one or more bathrooms, either in the ward annexe or in a special room for the purpose, as it is often convenient to make use of these rather than take some patients to the general bath-house, before described. For these baths, the same rule must be observed of providing sufficient space for two attendants, one on each side of the patient, who, it must be remembered, may be either too weakly to assist in his ablutions, or otherwise disposed to be refractory or violent. For the majority of the patients, however, a general bath-room, conveniently placed, is found most desirable for the bathing of the patients. It is of considerable importance that there should be ample means for *quickly* bringing into action the hot, cold, and waste taps. These should be of large size therefore. The arrangements should be such as to preclude any danger of scalding patients, and the taps should show when the hot and cold water is flowing.

Each ward should be provided with ample convenience for stores, clothing, bedding, crockery, and all other things required in *that* ward, these being obtained, as a rule, from the general store-house of the asylum, as required, in moderate quantities. There should also be boot (and bonnet) rooms *near the patients' doors* leading to the grounds or airing-courts, so as to prevent the inmates from bringing in dirt from outside the building.

A more costly arrangement of a plan for working quiet and chronic patients is shown upon the plans, Figs. 5 and 6. In this case the dormitories have only two rows of beds, and there is a liberal provision of single rooms. A plan of this kind occupies a greater area of land, but it is in many respects a very desirable one, and there are ample opportunities for the sub-classification of patients.

The staircases are so placed that there would be two exits to all the principal rooms on the upper floors, and on both floors the arrangements are such as to entirely shut off a ward for any special purposes that may be required, and the occupants of any section may easily gain access to the airing-courts and gardens without intruding upon adjoining day-rooms or dormitories. In arranging a plan of this kind the day-rooms should be well-lighted rather than the dormitories, the reverse being sometimes admissible for wards for sick and bed-ridden patients.

The following are amongst the official regulations for corridors and staircases in asylums in this country :—

"As a *general rule*, corridors or passages ought to be no wider than necessary to connect the several parts of the building. On the upper stories corridors, and in particular wide corridors, should, so far as possible, be avoided. It would, however, be of advantage to have on each side of the building, on the ground floor, one good corridor, or two, to the south, with a large bay window; and these corridors should not be less than 12ft. or 14ft. in width, the corresponding space on the upper floors being made available for dormitories."

"The stairs should be built of stone, without winders or long straight flights. The well should be built up, and handrails should be provided on each side of the stairs."

"The staircases should be of such number, and be so placed, that the medical officers, attendants, and others may pass through from one part to another, without unnecessarily retracing their steps, and as to afford ready egress to patients in case of fire. Every dormitory must have two exits, one at each end, and (in the case of rooms not on the ground floor) leading to separate staircases."

"All the corridors and day and sleeping-rooms should have boarded floors, and it is desirable that the boards should be narrow and tongued. Oak floors, capable of being cleaned by dry rubbing, are preferable for the corridors and day-rooms, and for the single rooms occupied by dirty patients. Where oak is not used it is indispensable that the boards should be of the best yellow deal, of narrow width, and thoroughly well-seasoned. At each end of a corridor the continuity of the timber floor should be broken by fireproof construction, so as to prevent the spread of fire beyond the corridor in which it may occur. The floors of the sculleries, lavatories, urinals, and water-closets should be of cement or tiles. Wherever practical, horizontal and lateral fireproof construction is adopted. The ceilings next below the roof in all parts of the asylum occupied by patients should be constructed throughout of imcombustible materials. Hydrants connected with the cisterns in the roof (or, which is preferable, in a water-tower of considerable height) should be placed in convenient positions on all floors, and an external main provided, by which water could be thrown over the building. The walls of the galleries and rooms generally should be plastered or cemented, unless lined with pressed bricks. Dados of pitch-pine may with advantage be used in day-rooms and corridors."

In Fig. 4 is shown a sketch arrangement for a ward for chronic and working patients, the general position of which, with regard to the administrative buildings, is shown in Fig. 1. The medical officers and attendants could pass through the whole or sections of this ward without having to unnecessarily retrace their route, entering and leaving the block by the doors Y Y, Fig. 4, or through the corridor doors of the intermediate wings, inspecting, as may be necessary, the occupants of the dormitories, day-rooms, and single rooms.

The dormitories are so arranged that there would be cross-currents of air for ventilation. The day-rooms would have the great advantage of a southern aspect, except the day corridors marked N, Fig. 4, with which the single rooms would be connected, and which would be suitable for patients for whom an excess of light might be undesirable.

The attendants' rooms are generally arranged (*vide* plan shown on Fig. 4) so that the officials may have views of two apartments by glazed doors or windows communicating with each.

The boot-room at X, Fig. 4, is arranged in a position so that persons coming from the airing-courts and gardens, &c., may not tread dirt in through to the corridors. The annexes, with water-closets, &c., are placed so that they may be approached from the day-rooms and dormitories, without any disturbance of the patients of other wards either by day or night. These annexes should also provide for a bath and some additional lavatory accommodation beyond what is elsewhere arranged for, and there should also be a slop-sink included. A coal store is provided at O, and linen and other stores at R T (*vide* Fig. 4).

The arrangement shown on Fig. 4 allows of considerable sub-classification of the chronic patients. The first floor above would correspond generally; but the second floor would be arranged for associated dormitories only, no day-rooms or single sleeping-rooms being allowable above the first floor.

In arranging the plans of water-closets, passages, staircases, &c., it is well to bear in mind that many of the patients require to be constantly in view of an attendant for a variety of reasons; therefore there should be as few opportunities for concealment as practicable—no recesses or dark corners. All day-rooms and dormitories must have entrances at each end, that there may be means of escape during panic or fire, or other occasion, during excitement of a dangerous patient, &c.

Two head attendants—a male and a female—should take charge of the lower staff. Only persons of considerable bodily strength should be engaged as attendants. They should also be intelligent and good-natured. Each attendant is generally intrusted with not more than 10 patients; but some patients require the entire services of an attendant.

It is difficult to provide for all that is necessary for the advantage of the patients unless the buildings for their occupation are very carefully planned, and in order that the arrangements in connection with an asylum may go on with order and without confusion, there is always a written set of rules for the guidance of the officials. The precise duties of each servant are definitely stated. The discipline of an asylum should be stringent, and all the operations so conducted that everyone, whether healthy or insane, who visits or resides in the establishment may be impressed with the idea that it is conducted on rational principles; a sense of tranquility and ease should pervade the whole, and the desire for activity on the part of the patients, which precedes and accompanies every case of recovery, should be quietly and moderately indulged. Every gloomy, ascetic, barrack-like idea should be avoided, and the great object should be to diffuse a spirit of cheerfulness. To attain full success, therefore, the officials must be provided with apartments arranged by an architect who shall have acquired an intimate knowledge of the habits of insane patients, and the means adopted for their relief or cure.

Here it may be noted that there have been other systems than those formed by confinement in asylums, whereby the insane have been maintained and employed. A colony of insane, for instance, was formed in the village of Gheel, in Belgium, in which (it is said for several hundreds of years) lunatics have lived together with the inhabitants, and even resided in their families. (In former times, it is stated that people frequently resorted thither to supplicate the aid of Dymphne, the patron saint for the insane.) Here the lunatics enjoyed an amount of pleasure and freedom which could never be permitted them in an asylum. Owing to the peculiar position of Gheel, escape by the patients would be difficult; it is inclosed by moors, and is at a distance of many miles from other villages. With all its advantages, it is said to have had undoubted drawbacks; but the arrangements at Gheel proved that the greater number of insane do not require the confinement of an asylum, that many of them can safely be trusted with more liberty than these institutions allow; hence there is further evidence of the desirability of architects planning asylums which shall be hospital homes rather than prisons.

The case of Gheel suggests the question whether similar colonies might not be established in other places—say in one of the poverty-stricken country districts of Essex or other counties, where the land is falling out of cultivation; some suitable spot might be found, and the evils resulting from overcrowding of lunatic asylums thereby removed. An expert stated years ago that "in England and Germany an exact imitation of Gheel has been recommended. It was proposed to assemble a number of lunatics within a village in the immediate vicinity of a Government asylum, so that it might maintain a certain relation to them. The difficulties in the way of adopting this plan, which have been collected and clearly set down, have not been yet surmounted. Still, however, I continue in the belief that the day will come when the means and method will be discovered by which the problem of a lunatic colony, and thus the question of the care and treatment of all classes of the insane, will be finally solved."

Thus it will be observed that architects may, in course of time (for certain descriptions of the insane), be called upon to design some asylums which would be more in the nature of small villages, suitably inclosed, rather than institutions arranged as at present.

◆

THEATRES.—XLIII.

By Ernest A. E. Woodrow, A.R.I.B.A.

THE nature and arrangement of the gas-fittings must, of course, play a very important part in the theatre's safety. We find this recognised in all English and foreign theatre regulations. Jointed brackets, telescopic pendants, and swinging pendants are in no case admissible; all brackets must be stiff brackets fixed without joints, and all gas-burners within 3ft. of the ceiling must have metal consumers hung over them to distribute the heat. Wire basket globes should protect all gas-jets; these, especially in the dressing-rooms and the parts of the house frequented by the rough element, should be fixed to the brackets. In the dressing-rooms the globes are frequently removed by the actors in order that they may heat their curling-irons and "make up" in the gas-flame; this can only be prevented by fixing the wire basket. To avoid this removal of the globes, I have seen them made with a small square left open near the bottom for the admission of the irons; this is a thoughtful precaution. Wire globes, especially in the supers dressing-rooms, are often battered down flat at the top and made to hold a small saucepan or vesse for heating water in. This should never b allowed by the management, as the carbo from the gas-flame collects, becomes incan

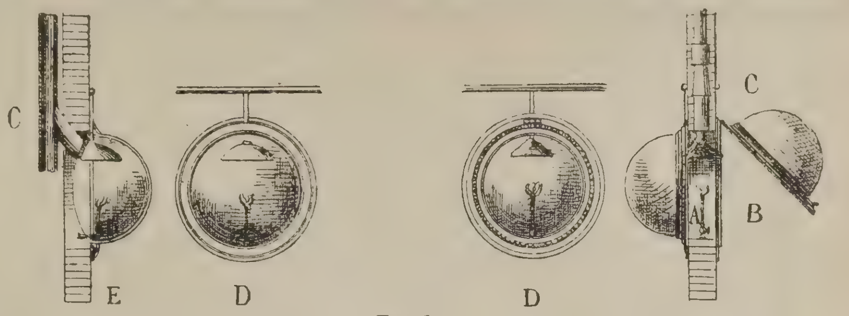

Fig. 1.

descent, and may fall in the form of soot heated to a red heat on the dressing-table, on some muslin, or fine drapery. To avoid the danger from falling soot, the wire baskets, under all circumstances, require constantly cleaning. Where a gas-jet is placed in some unfrequented part of the house, and dust collects on the wires of the basket, the same danger arises. Wire globes made with metal consumers attached also, on account of the collection of soot in the consumers, require careful watching. Speaking on the subject of guarding lights by wire, Sir Eyre M. Shaw, in his work on Theatres, points out the necessity of placing these wire protectors at such a distance that any material coming in contact with the guard would be out of reach of the flame. "It is better," he says, "to have nothing at all over or around the lights than to have guards placed, as is too commonly the case, in such a way that they serve to hold falling materials within reach of the flame, as where there are no guards, there is, at least, the possibility that the falling materials may extinguish the light." The same authority advises that where there is glass round or over lights there should be a metal grating underneath to prevent broken fragments of glass falling and injuring persons, or setting fire to the place.

No person should be allowed to light up or turn out the gas, other than the authorised gasman or fireman attached to the theatre. To prevent the general public, performers, or staff turning on the gas, or turning it out, every bracket throughout the whole of the building should be fitted with what is specified in the London County Council regulations as a "secret tap"—that is, a tap so arranged that it cannot be turned by the fingers, but only by a key made to fit the cock. This precaution serves two purposes: it prevents mischief-makers putting any staircase or landing in darkness by extinguishing the light, and it also prevents the general staff using matches to light the gas. To any part of the building where a light is required the gas-man has to be fetched, and the only means by which he should be permitted to light up should be a metal spirit-torch or electric spark. In this way, by the observance of a very small detail indeed, the architect will enforce the abolition of a continuing risk. This is another example of the deep study of minute detail required in planning, constructing, fitting-up, and furnishing a theatre.

It would be a great advantage where gas is used as the chief illuminant for a theatre if all the wall brackets were placed in recesses made in the wall and closed in by a glazed door, and a flue made in the wall to carry off the product of combustion; then the air would be purer, and the light protected from the mischief-maker. This is done in some cases at the Criterion Theatre, and in Fig. 1 will be seen how it is arranged at the Théâtre du Châtelet Paris in the corridors. This illustration is taken from M. Gorset's work. A is the gas-jet; B the glass cover open; C the escape-shaft; D the glass cover closed; E the section. Where a second system of lighting by oil or candle-lamps is provided (a part of this subject on which I must speak hereafter) it would also be a benefit to place them in similar recesses shut in by glass doors, and ventilated into flues, for then in cases of fire the smoke would not extinguish the lamp, a risk which all "safety" lamps in theatres at present run at the very time they are most needed.

The placing of dressing-room gas brackets must be governed by the arrangement of the looking-glasses. This is well illustrated in the diagrams (Fig. 2) from M. Gosset's book, of the dressing-rooms at the Paris Opera House, where lamps are placed on either side of each looking-glass. The spacing-out of staircase lights must be such as to leave no shadow on landings or on the steps, that would cause anyone to stumble in the uncertainty of finding the steps. Indeed, it goes without saying that all parts used by the public must be well lighted up.

The auditorium lighting, as a rule, receives great attention at the hands of the architect; but the placing of gas-jets round the circle fronts, as shown in the illustrations of the Carl Theatre in my last article, calls for condemnation, as paper programmes or handkerchiefs may be dropped from the tier above and lodge in the flames. The vitiated air rising from immediately below the people leaning forward to view the stage is fatal to such an arrangement, which is both unhealthy and dangerous. The old Astley's Theatre in the Westminster Bridge-road, which has lately been pulled down, was lit up in this unsatisfactory manner.

The glass chandelier, which used to be so often used, depending from the centre of the auditorium ceiling, we are all glad to be able to say is a thing of the past. Heavy it was, and dangerous, besides obstructing the view of many occupants in the gallery. The sun-burner, both as a means of lighting up the ceiling and as a powerful extractor of foul air, was a welcome change, and its usefulness is strongly marked by the fact that even in theatres lighted by the electric light it is still to be found in use as a ventilator.

The sun-burner should be encased with iron, where it passes through the roof of the auditorium, especially if that roof be a wooden one; although we know wooden roofs to theatres should never be permitted, yet some still exist. Access must be made through the roof to the sun-burner, to enable the gas man to periodically attend to and clean it, as the risk of incandescent carbon falling on the occupants of the pit and stalls is, to say the least, unpleasant, and might be somewhat surprising and annoying to the audience, quite apart from the danger of setting fire to a lady's dress.

I must now try and give a rough description of what the gas arrangements on the stage are like, and in this I am very much assisted by the sheet of details, Fig. 3, specially prepared for me by Messrs. Strode and Co., the theatrical gasfitters, for the purposes of this paper. On the prompt side of the stage fixed to the proscenium wall must be placed the gas-plate or stage regulator. On this plate must be fitted cocks which govern the whole of the lighting of the building, and each cock must be distinctly and clearly labelled by words engraved upon the plate. The diagram clearly shows this arrangement. The necessity of placing the plate on the prompt side is in order that the gas man may be near the stage manager, and obey his direction for the turning up and down of the lights in the auditorium and on the stage, for the various stage effects. Again, it is necessary that the whole gas system should be under the control of one experienced and reliable man, and that he should be located in such a position as to command a view of the whole building; therefore all mains must be brought up to the gas-plate, and have stop-cocks thereon governing the supply. In case of accident the gas man must judge whether to turn off or turn on the lights.

The sun-burner, and nearly all the fixed stage lights, are now arranged with a pilot light, which is never turned off. This avoids the spirit wad on a long cane being wabbled about among the inflammable scenery. The hanging gas battens, which depend from the gridiron, are fitted with the pilot light, and a row of spreading fish-tail burners which are technically called the "flash" light. When the flash light is turned on at the gas-plate, the pilot ignites the gas, and the flame spreads from burner to burner, the entire length of the "batten" or "float"; then the gas man turns on the ordinary jets in the batten, and the flame from the flash immediately lights these up, the flash being at once turned out. The battens are, of course, each fitted with two sets of pipes, from which the burners project, one pipe for the flash light, and one for the ordinary jets.

The gas battens must be hung by at least three wire ropes, and be protected at the back by a metal shield, fixed to a stiff iron frame (see diagram) which acts as a reflector, and they must be protected in the front by a stout wire guard. The gas battens are often much knocked about, being frequently used by the stage hands as a means of access from the flies on the one side to the flies on the other—in fact, acting as a kind of bridge. They must, therefore, be very substantial; and especially so must be the front guards of wire. In olden days, when coloured lights were required from above the stage, mediums of some cotton material like calico were drawn tightly over the front of the battens. A more dangerous custom could scarcely be conceived. From frequent use the mediums became rotten, torn, and singed by close proximity to the gas, ending in the ragged and frayed edges, more often than not, becoming ignited right up among the hanging canvases over the stage. One of the immense improvements in stage gas-lighting of modern times was the abolition of these dreadful calico mediums, and the substitution of glass mediums. The introduction of the flash-light was also a great step towards securing safety.

Mr. Buckle, when writing on the subject of gas illumination in theatres, advises the desirability of inverted Argand burners in place of the usual footlights, which he describes as a terrible source of contamination to the atmosphere, stifling to the performers, and irritating to the audience—more particularly to that portion occupying the pit and stalls. The inverted Argand burner he would have arranged so as to discharge their products of combustion downwards into flues connected with an extract shaft, and he states that there would be no practical difficulty against this innovation beyond the reluctance shown by managers to depart from stereotyped methods. The arrangement suggested, he points out, has already been for some time in practical use at the Grand Opera House, Paris, where an artificial draught is produced by a vertical shaft at one side of the stage, in which are fixed two or three rings of gas-burners. This shaft communicates with a horizontal draught tube below the foot-light burners on the stage. The horizontal gas supply-pipe passes below the draught tube, supporting a series of small vertical branch pipes, which are arched over the draught tube, and terminate in reversed burners, by which means the flames turn downwards from the top to the bottom of the glasses, and pass into the draught tube. Mr. Buckle goes on to show how, by this arrangement, the entire products of combustion are drawn to the outside air, leaving the stage agreeably cool, so that the artists and *danseuses* can approach close up to the footlights without the danger of their costumes igniting, and can breathe much purer air than the vitiated atmosphere given off from the ordinary footlights. In Fig. 2 is given an illustration of the method adopted to supply air to the footlights by a trunk below the burners at the Lyrique Theatre in Paris.

The most dangerous part of the stage lighting is undoubtedly the temporary lights which have to be shifted from one part of the stage to another, being changed in position for each succeeding scene. The difficulty experienced in past times was how to avoid an escape in making and disconnecting so many unions between the mains and the flexible pipes to be carried across the stage or up the sides of screens, to the rows of lights known as "ground rows" and "lines." This difficulty has been overcome to a very great extent—indeed, I think I may say entirely—by the introduction of an automatic water-joint, a detail of which is given in Messrs. Strode's drawing herewith, Fig. 3, which, as the temporary length of piping is connected with the main by inserting the dip, makes a gas-tight joint, and as it is placed in or withdrawn, turns the gas on or off. The movable lengths and wing-lights on a stage must be efficiently protected by stout wire guards, and mounted upon a metal frame, with sheet metal at the back of the light, whether the "lengths" be for ground-rows, to light up the scenes near the ground, wing-lights for the sides, or hanging

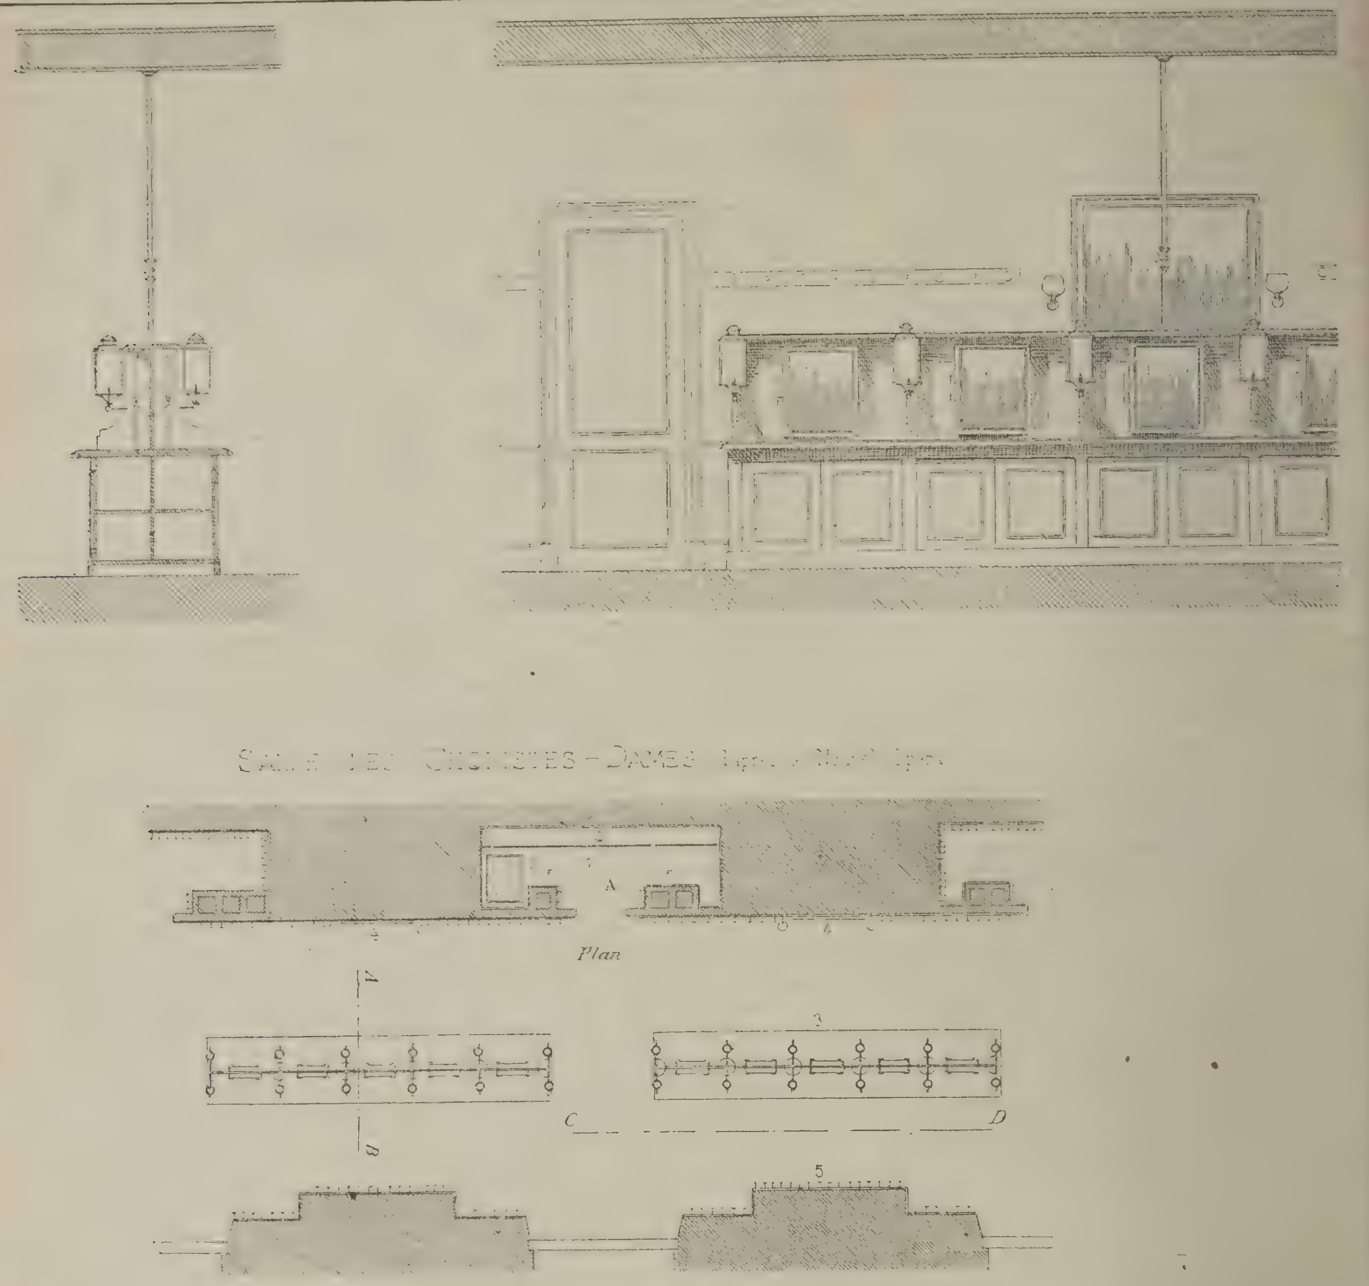

Fig. 2.

lengths. On this point of movable and stage-lights the London County Council's regulations enforce that—

"Where there is a stage or wings with scenery, the footlights or floats shall be protected by fixed iron-wire guards, and the burners shall be provided with glass chimneys.

"The rows and lines, and gas-burners in the wings (which must commence 4ft. at least from the level of the stage) shall be protected by fixed iron-wire guards.

"All battens shall be hung by at least three wire ropes, and be protected at the back by a solid metal guard and wire fixed to a stiff iron frame at such a distance from the gas-jets that no part of the scenery or decoration can become heated.

"All movable lights shall be fitted with flexible tubes, and the gas in every case shall be turned off by the tap on the stage, as well as by that on the flexible tube.

"All flexible tubes shall be of sufficient strength to resist pressure from without.

"An indicating gas-plate shall be provided at a convenient place at the side of the stage."

The other rules of the L.C.C. as to gasfittings read as follows:—

"All such premises, when lighted by gas, shall have separate and distinct gas-services and meters, as follows:—

"(*a*) To the stage;
"(*b*) To the auditorium;
"(*c*) To the staircases, corridors, and exits.

"Such meters shall be placed in properly ventilated chambers of fireproof construction.

"All gas-brackets shall be fixed without joints; and all burners within reach of the audience shall be fitted with secret taps, and be efficiently protected by glass or wire globes.

"All gas-burners within 3ft. of the ceiling shall have hanging shades of uninflammable material to distribute the heat.

"All gaspipes shall be made of iron or brass."

Most of these points I have already enlarged upon. Some other notes which I have collected from foreign regulations may not be out of place here; but I will only briefly mention those which are not included in the London rules. In New York, the gas-burners have to be provided with metal ducts or shafts to carry off the vitiated air. Provision is also made in this city for shutting off the gas from the outside in case of accident. In Berlin, the only means of lighting-up allowed is by inclosed and safe lighters, the use of lucifer matches, naked wax lights, &c., being prohibited. Here is a useful rule peculiar to Berlin: once in three months an examination must be made of every gaspipe, by recording the escape of gas when the main supply cock is turned on and all other taps turned off. This brings me to speak of the necessity of laying all gaspipes in positions so that they can at all times be got at and examined.

The regulations as to supporting and protecting glass chandeliers in the auditorium in Paris need no comment here, glass chandeliers being things of the past. All lights at a less distance than 7ft. from the floor are needed by the Austrian regulations to be placed in recesses or niches, and protected by glass or wire globes. In St. Petersburg, where there are movable lights on the stage, they must be at least 3ft. vertically and 2ft. horizontally distant from any inflammable material: footlights in this city must be lighted from below.

The lights in the staircases and passages of a Paris theatre must, in addition to having glazed fittings (*appliques vitrés*), be furnished with wire globes. There are other minor details which I will briefly note, such as the supply-pipes of the battens and floats being at a higher elevation than the wings (*châssis*); the footlights constructed with reversed jets, as I have referred to above, described by Mr. Buckle; the ground lines covered with basket-like coverings of close mesh wire; and the necessity of keeping the instruments, cloths, &c., for trimming oil-lamps in a metal box.

Brussels provides that the lighting of theatres shall be so arranged that in case of an accident the lighting of the auditorium, corridors, staircases, and public exits will remain intact, notwithstanding the gas is cut off from the stage. The gas-plate on the stage must, according to these rules, only extinguish the gas on the stage, in the dressing-rooms, property-rooms, and a portion of the auditorium. For this purpose there must be provided separate supplies, with a sufficient number of by-passes from the main.

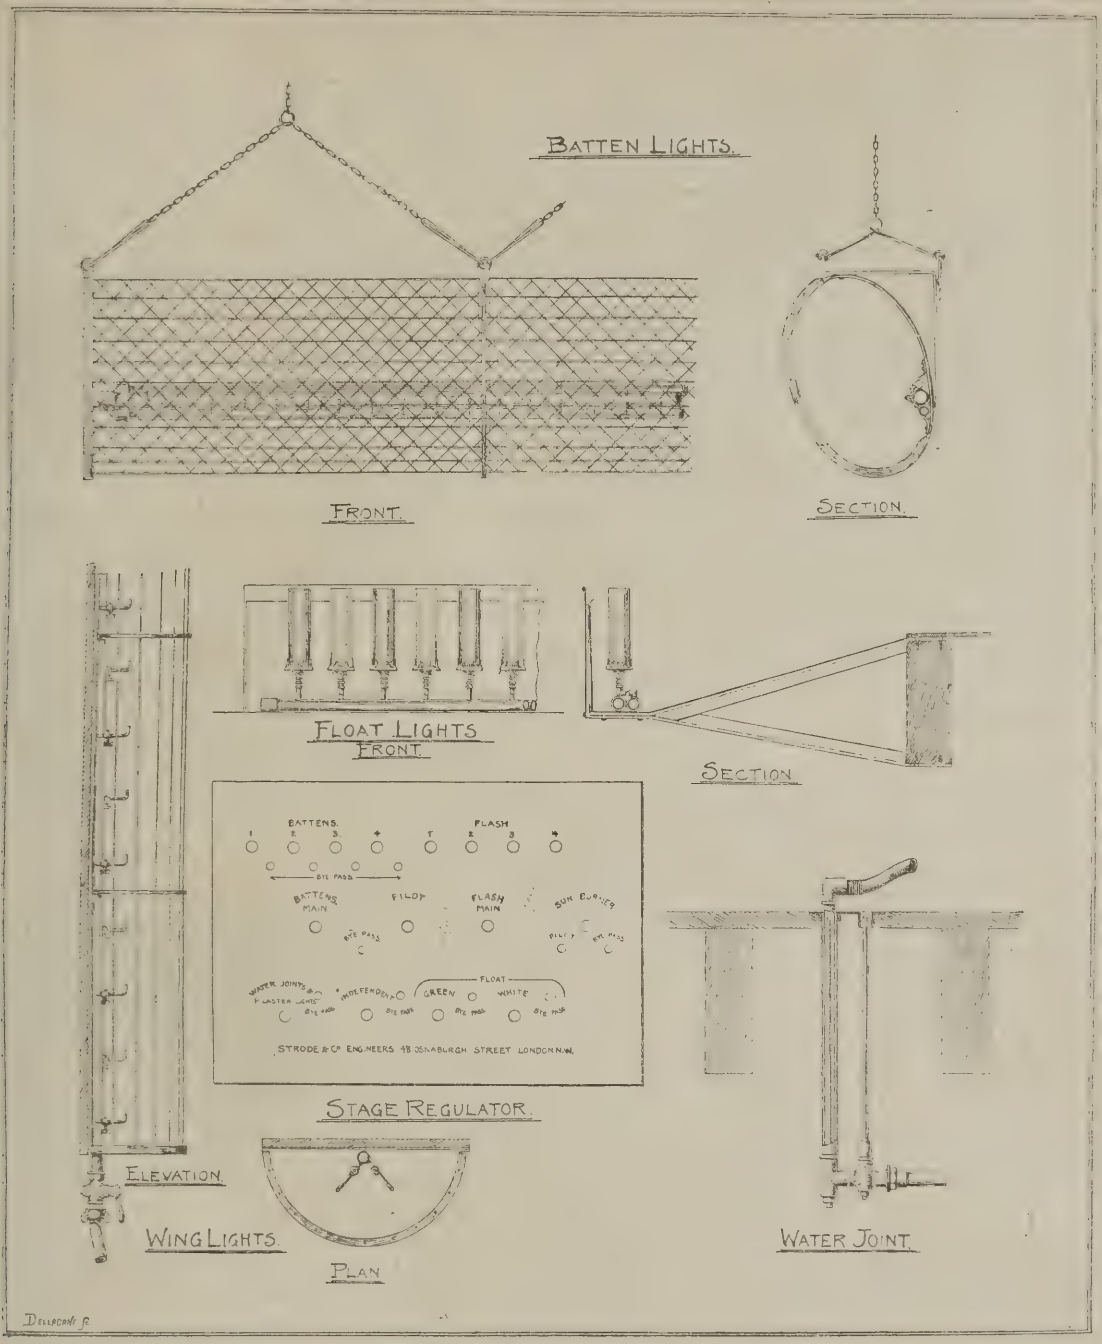

Fig. 3.

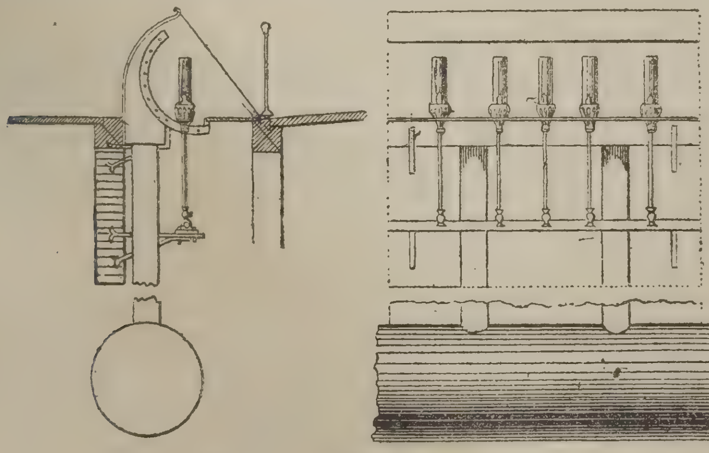

Fig. 4.

The wing-lights in Brussels (*becs des portants*) must have glass chimneys furnished with smoke-consumers, and arranged in such a manner that the breaking of a chimney will extinguish the jet. Gas-jets with chimneys must have regulators, smoke-consumers, and fixed wire trellis; those without chimneys, metal protectors; and those isolated, fitted with regulators and placed in fixed lanterns, and fixed at no less distance than 8in. from a ceiling, unless protected with iron. Where lights are on wood supports, the woodwork must be protected with iron sheeting to a height of 8in. above the flame.

I have already mentioned that the most recent German regulations entirely prohibit the use of gas in a theatre.

Some very interesting remarks are made by Mr. Buckle upon the almost incredible amount of gas consumed in an ordinary theatre. He gives these figures as taken at the Princess's Theatre, London, when Mr. Wilson Barrett was lessee, as the average nightly consumption: — Stage, 9,000ft.; auditorium, 8,000ft.; offices and corridor, 4,000ft. This writer also calls attention to the difference of consumption according to the nature of the performance, and attributes many accidents to the insufficiency of the gas-meters, which are frequently overtaxed when on special occasions many extra stage-lights are used without any regard to the capacity of the meters. The remedy he suggests is that arrangements should be made whereby the supply could be diverted from one section of pipes to another, and a switch be provided to obtain the gas direct from the main on emergency.

* * *

CITY AND GUILDS INSTITUTE.

THE annual report of the City and Guilds of London Institute states that last year 853 classes were registered with 25,718 students in attendance, against 734 classes and 24,374 students the previous year. The number of candidates examined during the year was 11,631, being 1,377 in excess of the number examined the previous year, and the largest increase in students since the foundation of the Institute.

Whilst the number of candidates' papers for the technological examinations has increased from 9,179 to 9,907, the number of passes has increased from 4,847 to 5,481, the percentage of failures having fallen from 46·4 to 44·6, a result stated to be in no way due to any lowering of the standard for passing. There has been no break in the steady and continuous increase in the number of candidates in plumbers' work. The numbers during the past few years have been successively 569, 684, 825, 988, and this year the number has risen to 1,253, showing an increase 265, the largest yet reached. Of these 1,253 candidates 652 have passed, 192 in the Honours Grade. At the practical examination—an optional one—450 candidates presented themselves, as against 293 in the previous year, and of these 202 satisfied the examiner. Of these 202, 168 also succeeded in the written examination, and will receive the certificate of the Institute.

In plasterers' work there was a marked increase in the number of candidates, although the quality of work sent up for examination is not yet of a high order. An examination in cabinet making was held this year for the first time; four classes were registered, with 77 students, of whom 43 came up for examination. Besides the classes in technology, attended mainly by artisans, 152 classes in manual training were registered by the Institute during the past session. These classes are intended exclusively for elementary school teachers.

BOOKS RECEIVED.

The Slide Rule, by Charles N. Pickworth, Wh.Sc. (London: Emmott and Co., Ltd., Fleet-street), is a small and useful manual on the Slide Rule. The author says, of the several works on the Slide Rule, none, as far as he knows, relate to the rules of the Gravêt or Mannheim type, which design of instrument possesses many advantages over the older forms. The examples given show how many and diverse are the uses of this instrument when properly understood. The civil, mechanical, and electrical engineer will find many of their calculations simplified by the intelligent use of the instrument. The general theory of the slide-rule is explained. Examples of computations on mensuration, weights of metals, falling bodies, steam-engines, steam-boilers, belts, ropes, strength of shafting, moments of inertia, horse-power of water wheels, electrical engineering, and various general commercial and trigonometrical applications are given, which cannot fail to be of value.——*Indian Engineering* for Sept. 29th contains an interesting summary of a valuable paper by Professor Mansfield Merriman, which appeared in *Engineering News*, on "Column Formulæ." The diagrams explaining Professor Merriman's theory of computation are interesting. As an approximate guide for ordinary practice, we recommend the paper to the notice of our readers.——*Tramways: their Construction and Working*, by D. Kinnear Clark, C.E., M.Inst.C.E., &c. Second edition, rewritten and enlarged (London: Crosby Lockwood and Son) is a bulky volume of over 700 pages, containing a history of the tramway system, with descriptions, illustrated in every case, of the various modes of traction, horse-power, steam, heated water, compressed air, cable, and electric traction, and particulars and sections of the rails and rolling-stock in use in the United Kingdom. This edition has been greatly enlarged. Mechanical traction, such as cable and steam-power, has compelled the employment of improved tramways in which girder-rails are used. The chief English tramways—as those of London, Liverpool, Glasgow, Edinburgh, Manchester, &c.—are described and illustrated, with their cost and working expenditure. Cable traction has been mentioned, and the plans used at San Francisco, Chicago, Highgate-hill, Edinburgh, Birmingham, and Brixton are referred to in Chapter VI., the latter being illustrated by plans and sections of the works at Streatham. Electric traction, as employed on the Liverpool Overhead Railway, at Leeds, the City and South London Railway, &c., also receives attention. The various plans of laying tramways and the sections of rails patented occupy a large portion of Mr. Clark's volume. It is up to date, and the illustrations are numerous. A few more details of the Streatham cable tramway would have been useful. On the whole, however, Mr. Clark's work gives a valuable epitome of the modern tramway system. —— The *Engineering Magazine* for October (London: G. Tucker, Salisbury-court, Fleet-street), comprises several readable articles, including "Evidences of a Revival of Business," as shown in the New York markets—a series of interviews; "The Cost of Living in Great Britain and the United States," by Andrew Carnegie; the "Industrial Development of Chile," by Courtenay De Kala, illustrated by several beautiful photo. prints. Professor W. F. Laird writes an appreciative and critical paper on "Recent Architecture in Philadelphia," illustrated by some typical designs of town houses on photo.-blocks. Some of these show picturesqueness and a quietness and restraint of treatment that are commendable when we compare the designs with the poor class of work of recent years. Dr. Oliver J. Lodge writes on "Lightning and Lightning Conductors," and points out the absurdity of speaking of "areas of protection," or to think that one easy path protects all others in its vicinity. To make an easy path is impossible, as all paths offer a great resistance to sudden currents. Many paths are necessary. "Plenty of iron wire instead of a single copper rod" seems to be the conclusion of Dr. Lodge as to the protection of ordinary buildings. The article is worth reading, and is a summary of his work on "Lightning Conductors," which we have already noticed.

"A DANGER TO THE PUBLIC HEALTH."*

THE evils of mechanical ventilation on the down-draught principle on the plenum system have been pointed out many times in these pages. Medical testimony, to a large extent, is against a system which allows the vitiated respired air of patients in hospital wards to be retained above or around the beds and be re-breathed, and it is opportune to hear what sanitarians, speaking in conclave and with authority, have to say upon the question. The recent proceedings of the Congress of the British Institute of Public Health have recalled attention to the subject of ventilation by these means, and we now refer to a small pamphlet containing the remarks made in the *Local Government Journal* lately. Natural ventilation was strongly advocated at the congress, and Mr. T. B. Hall, F.R.I.B.A., referring to the ventilation of hospitals, remarked that: "It said much for natural ventilation that the duration of a scarlet-fever case could be shortened by its employment some six or seven days." The writer refers also to the reports from several hospitals to the same effect. Many of these reports refer to the unsuccessful trials of mechanical systems on the plenum principle of forcing the air in by fans and other means. The Local Government Board approves of the natural system of ventilation by automatic extraction of the vitiated air at the ceiling, and admission of fresh air below, and this plan has been adopted in the best hospitals of the Metropolitan Asylums Board under the advice of experts, including Sir Douglas Galton, F.R.S. The "hospital smell" is by this system eliminated; the fresh air is screened and warmed, so that all impurities are removed. Abundant evidence is adduced by the author to show that the "mechanical" or plenum system, by propelling the air through ducts along the ceiling and extracting it through foul-air exits at the head of each bed, really operates most prejudicially on the patients, who are compelled to re-breathe the vitiated air as it passes over their faces to the exits. An apt illustration of this fact is given by a coloured sectional diagram, showing the descending currents of fresh air keeping down the products of respiration above the patient. The fresh air, being heavier, prevents the heated respired air from ascending, while the position of the exits at the head of each bed causes the vitiated products of respiration to travel over the patient, and thus, according to the principle of downward ventilation, the patient is actually compelled to re-breathe the poisoned air of the ward. We have no space to examine other facts which are here summarised in a readable form; but we recommend all architects and others interested in the subject to obtain the first instalment of this reprint.

Sir J. Whittaker Ellis has consented to serve as president of the recently-formed House Property Owners' Defence Association.

ARCHÆOLOGICAL.

Excavations at Jerusalem.—Dr. Bliss, who is conducting excavations for the Palestine Exploration Fund in Jerusalem, sends home a report of recent work, in which he says that he has found, at a depth of a few feet, the foundations of a wall, which may be those of the actual first wall of the city, and are certainly on the site of that wall. In the course of the work he had uncovered three large square towers. He had also found a gateway, the door-sill of which was still *in situ*, with the holes of the door-posts and the holes for the bolts. This sill was 4ft. above the ancient paved road which passed through the wall at this point; but on digging deeper he found, 4ft. below—and therefore on a level with the ancient road—the sill of an older gateway. Herr Schick has found a postern in the north wall, on the exact spot where the Lepers' Gate is placed by writers in the 12th century—a fact which seems to show that the present position of the wall is what it has always been, and that the city never extended further north than this wall.

The Condition of the Parthenon.—Shortly after the recent earthquakes in Greece a commission of experts, composed of native and foreign architects and archæologists, was appointed to ascertain what amount of damage, if any, had been sustained by the Parthenon during the successive shocks. The commission has now sent in a report to the Greek Minister of Instruction, in which it states that the building has not suffered in any appreciable degree. At the same time it advises that, as a measure of precaution against future accident, the architraves should be strengthened with iron girders, and that protection should be afforded against rain, and, in particular, against the falling of small stones, which has gone on uninterruptedly since the Acropolis was destroyed by the Venetians.

CHIPS.

A new Roman Catholic school-chapel has just been opened at Longton Bridge, near Preston. It consists of a school for 60 children, a central chapel to seat 100, and a teacher's house, all in one block of uniform height and width. The building is of brick, with stone dressings, and style is plain Gothic. Mr. E. Kirby, Liverpool, is the architect, and Mr. Thomas Cottam, Preston, has been the sole contractor.

A committee of the local College of Physicians have issued a report recommending the Edinburgh Town Council to secure as a site for a new fever hospital either an area at South Grange, including Craigmount cricket field, Grange-terrace, &c., or an area on the eastern slope of Blackford Hill to the south of the road leading from the Harrison Arch to the hill.

The name of Mr. Joseph Gardner, of Seacroft, near Blundellsands, timber merchant, has been placed on the commission of the peace for the County Palatine of Lancaster.

A new police-station is being built at Aberaman. The contractors are Messrs. Williams and Williams, Cardiff and Mountain Ash.

The dedication of the new reredos in the Yeadon parish church took place on Sunday. The reredos is of Caen stone with marble columns, and is in the Decorated style. Messrs. Jones and Willis, of Birmingham and London, have carried out the work.

A rearing supper was given on Tuesday week at Winchester to celebrate the completion of new offices for the proprietors of the *Hampshire Chronicle*. The buildings have been erected from designs by the Mayor of Winchester, Mr. T. Stopher, and Mr. Shearman, of the same city, was the contractor.

The new Panama Canal Company, which has been formed to proceed with the construction of the Canal, was formally constituted at a meeting held in Paris on Saturday, and it was announced that 800 men would, on Monday, resume work on the abandoned cutting.

On Saturday the foundation stones were laid of the new public library at West Hartlepool. The site is the fourth portion of a square of which the municipal buildings and the police-court and station form the other parts, and the building will be erected from plans by the borough engineer, Mr. J. W. Browne. A newsroom, lending library, reference library, committee-room, librarian's room, and librarian's private office are provided. The newsroom will be 54ft. long, 30ft. wide, and 19ft. high; the lending library 47ft. long, 25ft. wide, and 13ft. high; and the reference room 47ft. long by 25ft. wide, and 13ft. high. The buildings will be of Grosmont bricks with terracotta dressings, to harmonise with the rest of the municipal buildings. The cost of the buildings and fittings is estimated at £3,500.

ELTHAM COLLEGE CHAPEL.—CHISHOLME TRUST BUILDING, MERCHISTON, N.B.—ROYAL ACADEMY GOLD MEDAL: DESIGN FOR A PROVINCIAL TOWN HALL.—DETAILS OF CARDIFF POST OFFICE.—ARCHITECTURAL PHOTOGRAPHS BY HAROLD BAKER.—BEAUPRE, GLAMORGANSHIRE.—NATIONAL PRIZE DESIGN FOR WROUGHT-IRON CANDELABRA.

Our Illustrations.

ELTHAM COLLEGE CHAPEL (THE ROYAL NAVAL SCHOOL).

This chapel is to be erected on the picturesque site to which the Royal Naval School moved a few years ago. The building is designed to form the S.E. corner of the proposed quadrangle, which it is expected the exigencies of the college will require in no distant future. The internal length of the chapel is 97ft. by 25ft. in breadth, and it is of lofty proportions. Accommodation is provided for 200, and all the stalls and panelling will be of oak. Internally, the walls will be faced with Bath-stone ashlar; externally, the building will be of red brick with Box Ground dressings, and a Broseley tiled roof. The architect is Mr. Edwin T. Hall, F.R.I.B.A., of 57, Moorgate-street, E.C.

PREMISES FOR THE CHISHOLME TRUST, EDINBURGH.

These buildings cost £7,000. The fronts are built of scabbled stone from Prudham, Northumberland. The slates used on the roof are Coniston green peggies. The premises are erected at Merchiston, Edinburgh, on ground belonging to the Chisholme Trust, and provide accommodation for superior flatted houses, with rentals varying from £40 to £60 per annum. The corner premises are occupied as a branch post-office for the district. Messrs. Dunn and Findley, of Edinburgh, are the architects.

ROYAL ACADEMY GOLD MEDAL COMPETITION DESIGN FOR A TOWN HALL.

The merits of this design, which we illustrate to-day by these plans and perspective view, have already been referred to in our pages, at the time of the exhibition of all the designs submitted in the same contest at Burlington House. Its suggestive treatment and breadth of handling impart an interest sufficient to warrant the present illustration. The arrangements proposed by the designer are clearly shown by his plans, which we leave to speak for themselves without further comment. Mr. A. Dunbar Smith is the author of the design.

CARDIFF POST-OFFICE.

This concluding sheet finishes our present series of illustrations of this important block of Post-office buildings now in progress of erection at Cardiff from the plans of Mr. Henry Tanner, F.R.I.B.A., of H.M. Office of Works. The plate furnishes a working detail to scale of the central gable of the façade towards Westgate-street, with sections fully explaining the construction adopted. Our previous drawings were issued in the Building News for Sept. 21st and 28th last.

ARCHITECTURAL PHOTOGRAPHS BY HAROLD BAKER.

This sheet of views, illustrating some eminently picturesque studies of old English houses, together with an ancient bridge, is composed, by permission, from a selection made by Mr. Harold Baker, a well-known artistic photographer in Birmingham, who has taken a large number of similar photographs in various parts of the country. The bridge at Tewkesbury calls for little special remark, and the same may be said of the delightfully quaint old shop, with its coved pentice, from the little town of Berkeley in Gloucestershire. Compton Winyates, in Warwickshire, is, of course, a very famous and beautiful house, rich in exquisite colour and admirable in its architectural detail, the notable mansion of the Marquis of Northampton. We gave a sketch and plan of the house in the Building News for Feb. 12th, 1892. Somershall Herbert, in Derbyshire, is another capital example of timbered work—an uncommon type of building in that part of the Midlands. It belongs to the FitzHerbert family, and is kept just as it should be, in good repair and structurally secure, without abominable applications of tar on the framings, which are left in their time-matured beauty of silvery-grey. Inside the house is simply furnished in the best of taste, harmonising with the outside.

BEAUPRE, GLAMORGANSHIRE.

Beaupre stands in a position justifying its name. It was originally the seat of the Cecil family (then spelt Cecwilth, the ancestors of Lord Salisbury), who built the greater portion of it. It has, however, been for many centuries in the possession of the Bassetts, and the beautiful Renaissance porch was built, as the inscription states, by "Rycharde Bassett, having to wyf Katherine, dovghter to Sir Thomas Johns Knight, Bwvilt this Porche and the Tourres Ano 1600." The majority of the building dates from the latter part of the 16th century. The walls are standing and those of the entrance court, and a portion of the buildings, consisting of some half-dozen rooms, is in the occupation of a farmer. The direct descendants of the Bassetts live about a mile away, in New Beaupré. R. Morton.

NATIONAL PRIZE DESIGN FOR CANDELABRA.

In this design an attempt has been made to deviate from the usual form of candelabra, in which the candle-sockets are generally poised on separate arms springing from a central stem—a form beautiful enough with proper treatment, but apt to be hackneyed. This has been done without any violence to construction or the material employed. The base is firm and consistently plain, gradually merging into more complex detail in the band, and when carried out, as intended, in half-brightened iron, should be very effective, especially so when in use, from the reflections in the shields that fill the angles of the geometric band. The illustration is reduced from the full-sized drawing, and therefore is not to any particular scale; but the height, 26½in., will give an idea of the other dimensions.

◆

The new church of St. Magnus, Bessingby, near Bridlington, was consecrated on Thursday in last week by the Archbishop of York. The church is in the Decorated Gothic style, the exterior is of Whitby stone, and the interior of Ancaster and Dumfries stone. The pews, pulpit, reading desk, and lectern are of carved oak. The special gifts include an organ, a peal of eight tubular bells, heating apparatus, and lamps and chandeliers.

A portion of the premises of Mr. J. B. Delany, cabinet maker, Birkenhead, was destroyed by fire on Saturday, damage to the amount of from £7,000 to £8,000 being caused. The floors are fitted with double ceilings, and to this circumstances is due the fact that the fire did not spread downwards, as a vast quantity of water lodged in the ceiling of the second story, forming a reservoir which effectually cut off the flames from the lower part of the premises.

The borough of Weymouth is seeking to extend its borders, and proposes a scheme by which its area will be three times increased (from 453 to 1,346 acres), and raising its rating-power by £12,000. General Carey, R.E., held a lengthy inquiry on Wednesday week at the Guildhall, on the memorial of the Weymouth Corporation. The extension was opposed by the inhabitants of the parish of Wyke, and also by the inhabitants of Radipole, to the number of 3,000 people; but the application was principally based on the fact that an extended scheme of sewerage was contemplated by the borough, and that Westham and a portion of Wyke would be benefited.

COMPETITION.

Halifax.—The competition which is being held for the Haxlifax and Huddersfield Union Banking Co.'s new premises has attracted a good many competitors, as forty sets of designs have been received.

◆

CHIPS.

Mr. Alma-Tadema's painting, "Fredegunde," which was purchased at the late Vienna Exhibition by the Reigning Prince Liechtenstein, has just been presented by the owner to the Vienna Academy of Arts.

At a meeting of Burntisland Harbour Commissioners on Friday, plans were submitted for new deep-water docks at Burntisland, prepared jointly by Messrs. Meik and the harbour engineer. The probable cost of alternative schemes ranged from £200,000 to £300,000. After discussion, it was agreed to postpone further proceedings in the matter till another year.

An Exeter architect, Charles Pinn, was allowed to pass his public examination at the Bankruptcy Court in that city on the 18th inst. His liabilities were said to be £850, and the assets £63; but the greater portion of the deficit was owing to Mrs. Pinn and members of the family. Failure was attributed to the taking over of certain property left by debtor's father, and paying off certain legatees under the will. The depreciation of the property had meant very great loss to him.

A block of sanitary chambers three stories in height, and costing £17,500, are about to be erected at the corner of Montrose-street and Cochrane-street, Glasgow, by the police commissioners of that city.

The foundations are being prepared for the erection, in York Minster, of the memorial monument to the late Archbishop Thomson. The situation is beneath the stilted arch adjoining the entrance to the choir aisle, in the south transept, hitherto occupied in part by the vergers' bench. Messrs. Farmer and Brindley, of London, are the sculptors.

The opening of the 2nd Hants Volunteer new drill hall in the Leigh-road, Eastleigh, took place on Wednesday week. The hall, the main front of which was illustrated in the Building News for June 8, 1894, is 72ft. by 40ft. in the clear, and has attached at the platform end officers' room, lavatories, and servery, and at the opposite end are dressing rooms. Mr. R. M. D. Lucas, of Southampton, is the architect, and Messrs. H. Stevens and Co., were the builders.

A stained-glass east window has been recently placed in St. Mary's Church, Stanford, Worcestershire, to the memory of Lord Alfred Spencer Churchill, by his four daughters. The subject is a replica of the well-known altar painting, "Easter Morn," in the church at Moldë, Norway. A cross of white marble has also been put up to Lord Alfred's memory.

An hotel is about to be built in Hans-place, Belgravia, at a cost of about £40,000, from plans by Messrs. Reed and Macdonald, of Oxford-street, W. The builders are Messrs. Stephens, Bastow, and Co., of Bristol.

Miles Eccles, foreman of works under the Beverley Corporation, dropped down dead on Tuesday week, in the Stoneway of that town, whilst superintending the workmen. Deceased, who was between 60 and 70 years of age, had been in the service of the Corporation nearly 30 years.

The extensive additions recently made to the buildings of Somerville College, Oxford, were inaugurated on Saturday afternoon.

Berkeley Chapel, Mayfair, which has been closed for the decoration of the chancel, was reopened on Sunday. The paintings have been executed by Mr. Hemmings, at a cost of £300. The altar-piece represents Christ enthroned in glory. On each side is a panel, one representing Christ with the Bread of Life, the other as the True Vine. Beneath is a triptych of the Crucifixion.

The first ordinary general meeting for the session 1894-95 of the Surveyors' Institute will be held on Monday, November 12th, 1894, when the president, Mr. Thos. Chatfeild Clarke, will deliver an opening address.

At the parish church of St. Hilda, at Ampleforth, on Thursday in last week, the dedication took place of new bells and a restored tower, and the unveiling of a memorial tablet in memory of the late Rev. J. T. F. Hicks, vicar of the parish for 36 years, and also the dedication of a new organ. The late vicar had restored the church and erected new schools, but the weather-beaten tower and the dilapidated belfry and bells remained unrestored. The present vicar undertook the duty as a memorial to his predecessor, and also had a new organ erected, the latter being built by Messrs. T. Hopkins and Sons, of Heworth, York.

WAYSIDE NOTES.

I quite agree with others who are indignant at the scandalous and incredibly unpatriotic way in which the Nelson Column is being made the means of advertisement of some vendor of "patent foods." Every night an advertisement, some 20ft. high, is made to pass backwards and forwards by means of an electric search-light. Where is this mania for advertisement to stop? Our streets and public buildings, and even the rivers and fields, are desecrated and made hideous by boards of all colours, and yet, not content with these means, the advertiser of to-day attacks our monuments, which should be as sacred as the walls of Westminster Abbey. I fully expect to find a dozen tablets recommending somebody's soap on the backs of the chairs in St. Paul's one of these days, or a comic slide introduced at the end of Mr. Carlile's little show at Fish-street Hill one Sunday night, setting forth the virtues of Spratt's dog biscuits. It pays, and there seems to be no one to prevent it.

St. Paul's, according to Mr. Haweis, wants a thorough "wash and brush up." Another correspondent fears all the fire-engines in London will not remove the coat of filth which has been allowed to incrust its walls during the last two centuries, and declares that a *thorough scraping* will alone effect this. That the towers have escaped the pollution is, it is suggested, due to the fact that they are fully exposed to the cleansing influence of wind and rain storms, from which the lower parts of the building, now as black as Erebus, are protected by surrounding buildings. I trust the Dean and Chapter will have nothing to do with the suggested "scraping." Once during the past thirty years the building has been cleaned with fairly good results, exteriorily by the means of the Metropolitan fire-engines, and doubtless might be again. But we may safely trust Mr. Penrose to save us from the man with the chisel, who has long ago spoiled more than one cathedral exterior where there was no smoke or soot to furnish an excuse. Mr. Sydney Vacher very sensibly points out that sooner or later damage would be done by any washing experiments with hose and engine to the weathered skin of the Portland stone, and further shows that it would be impracticable to bring the surface up to a uniform tone, as the material weathers differently according to the amount of rain and sunshine it is exposed to.

I hear that the Science and Art Department will shortly issue a circular which will practically revolutionise the present means and method of support to organised science and art schools. It is stated that it is the intention of the Department henceforward to make grants very much upon the same basis as that already adopted by the Education Department proper. I don't quite grasp the nature or extent of the wonderful changes; but I have no doubt that any "revolutions" have first of all the object in view of making things better for the Science and Art Department itself, and any fresh additions to its ranks that it has become necessary to provide for. It always has been so, and probably always will.

I wonder what the Queen will do should any foreign potentate having peculiar habits and customs honour this country by visiting it while "Claridge's," the famous hotel in Brook-street, where so many princes, pashas, ambassadors, and foreign notabilities of all sorts have made their home during scores of past seasons, is in the hands of the "housebreakers"? Its site has been acquired by a syndicate, and a vast new hotel, built on modern principles, will soon be erected upon it. Meantime, the whole of the contents of the labyrinthine building are to be sold by auction during the next three weeks. Although there is nothing of exceptional value, there are numbers of old chairs, tables, cabinets, clocks, &c., French and English, with quantities of china services, Sheffield plated ware, &c., that have been in use very many years.

Why should Knightsbridge wait for at least three more years before the intolerable obstruction to traffic caused by the narrowness of the roadway near Albert-gate is removed by the London County Council? The owners of the obstructive houses are said to be willing, but the County Council is not, and thus a much-needed London improvement is made to stand aside to await that indefinite future when London's Parliament will attend to London's most pressing wants. The Council need have no fear that by widening Knightsbridge they will be benefiting the rich, because owners of private carriages can escape the crush by driving through the Park. It is the omnibus and commercial traffic that suffers. But the London County Council appears to have its favourite localities for spending money, just as it appears to have favoured papers that get early intelligence and the lion's share of its advertisements. I fancy sometimes, as Mr. J. C. Kenworthy said some time since in the *Weekly Times and Echo*, that there are already signs that in another five years the L.C.C. will have become every whit as corrupt a body as was the old Metropolitan Board of Works.

Moorgate-street Station, on the Metropolitan Railway, is undergoing a complete transformation, which will make it one of the best-appointed underground stations in the metropolis. Not only is the entire front to be rebuilt, but the platforms will be provided with covered ways, and there is to be a joint booking-office for the chief railway companies having running powers to the station. This last improvement will be of great service to passengers crossing from one line to another, as, hitherto, the process of rebooking has been decidedly inconvenient. The Metropolitan Railway Company will bear the entire expense of the alterations, the other companies being only tenants, and paying, it is said, half a crown for every train that enters the station. There was a conference of managers on Monday and a tour of inspection, the result being that it was practically decided that the contract for the whole work should be signed next week.

The members of the London County Council have not yet made up their minds as to whether they shall expend £6,000 in commemorating Queen Boadicea, by placing a group of statuary on the tumulus, at the top of Parliament-hill Fields, which the very dubious tradition declares to be the burial-place of the ill-used British warrior queen. The late Mr. Thomas Thornycroft devoted fifteen years of his life to a gigantic group of statuary representing the queen, supported by her two daughters, on a chariot drawn by two horses, preparing for battle, and his son, Mr. J. I. Thornycroft, has offered to present the work for erection on Parliament-hill Fields. As a gift, the model is very well; but £6,000 is a good round sum for casting a work which might fail to meet with popular appreciation.

A Bill will be introduced next session for carrying out a railway scheme providing communication, through the Dee Valley, between South Wales and Manchester. The projected line will start from Wrexham, forming a junction with the existing Wrexham, Mold, and Connah's Quay Railway, and the line now in course of construction between that town and Ellesmere. It will pass through Isycoed, Holt, Farndon, the Waverton district, and Tarvin, and join the existing Cheshire Lines Railway near Mouldsworth Junction. It will cross the Dee at a bend of that river near Deeside Farm, where there is a natural sandstone cliff on the Farndon side. The engineer of the scheme is Sir James Szlumper, Mayor of Richmond.

A hitch has, the *Birmingham Post* states, occurred in the arrangements for erecting the new meat market and slaughter-houses in Bradford-street in that city. When the tenders for the buildings, ten in number, were opened, by the Markets and Fairs Committee, in every case the amount of the tender was in access of the amount (£45,000) authorised by the City Council as the expenditure on this portion of the scheme. The tenders were referred to a sub-committee, with a view to see whether any modifications of the scheme could be made to bring the work within the estimate. The lowest tender was that of Mr. John Bowen, which, subject to the modifications in question, the committee will recommend the council to adopt.

At the recent Civil Service examination for Irish county surveyorships, Mr. A. M. Burden, B.A., B.E., A.M.I.C.E., assistant surveyor R.E. Civil Staff, obtained first place, being the third gentleman in succession of the department who has achieved this distinction.

The Bishop of Lincoln reopened on Monday the parish church at Bicker, South Lincolnshire, after undergoing restoration. The chief alterations and improvements have been effected in the Lady-chapel, south aisle, and clerestory, and the south transept and porch, and the work has cost £1,450. The vicar is stated to have acted as his own architect, and Mr. S. Sherwin, of Boston, was the contractor.

OBITUARY.

Mr. Edwin Clark, J.P., M.I.C.E., a well-known railway engineer, who died at Cromwell House, Great Marlow, on Monday night, was born in that town just 80 years ago. He worked under Robert Stephenson, and as resident engineer had control of the construction of the Britannia Tubular Bridge, his brother, Mr. Latimer Clark, F.R.S., being appointed his assistant. For many years he was chief engineer to the Electric Telegraph Company. He patented the hydraulic graving dock and the hydraulic canal lift, and was inventor of the block system of railway signalling. He constructed the famous harbour of Callao, in Peru, and carried out engineering works in various parts of the world. Retiring in 1876, he settled down in his native town. He was one of the senior subscribers to the Institution of Civil Engineers, having joined that body as an Associate in December, 1850, becoming a Member in April, 1852.

CHIPS.

The city council of Chester have decided to adopt the Hoppole Paddocks, near the cathedral and the wall, as the site for the proposed public baths, on which from £5,000 to £6,000 is intended to be expended. The portion of the grounds not built upon will be laid out as public gardens. A much larger undertaking just decided upon by the same city council is the purchase for £27,000 of 418½ acres of land at Sealand, for refuse and sewage disposal purposes.

Dorchester Town Council have decided to erect an infectious diseases hospital on the outskirts of the town, and to take steps with a view to the formation of an ornamental public garden near the Great Western Railway Station.

The work of restoring the roof of St. Michael's Church, Sopley, Hampshire, which was destroyed in a gale a few weeks since, is being well advanced. Practically the roof is being rebuilt, the damage having been so great. Mr. Burton, of Bournemouth, is the architect, and Mr. Alexander, of Ringwood, the builder. The Bishop of Winchester will reopen the church, after renovation, on All Saints' Day, Thursday in next week.

The marble bust of the late Duke of Devonshire, which is to be placed in the New Pump Room of Buxton as a town memorial, is from the chisel of Mr. W. D. Keyworth, jun., and represents the seventh Duke in his robes as Chancellor of Cambridge University.

A new institute connected with the Young Women's Christian Association was opened on Friday, in Muslin-street, Bridgeton, for the east end of Glasgow. The new building is constructed of red sandstone, and has been built, furnished, and equipped, and the site secured at a total cost of £4,800.

At Tonbridge, on Friday, the Archbishop of Canterbury formally opened the new buildings which have lately been added to the grammar school. The buildings, which were designed by Mr. Campbell Jones, include a long range of workshops, classrooms, &c., together with a hall. They are lighted by electricity, and their cost, some £26,000, has been defrayed out of the property belonging to the school. Messrs. Strange and Sons, of Tunbridge Wells, were the contractors.

Messrs. Harry Hems and Sons, of Exeter, are completing for a church at St. Leonard's-on-Sea a reproduction, in white Castellino marble, of the Santo Volto or Crucifix of Lucca, said by tradition to be the work of Nicodemus himself, and certainly the oldest representation of our Lord's Passion in existence. On a background of veined alabaster is a cross of grey Dove marble. Before this stands (not nailed on to) a clothed and crowned figure of our Lord, shown as King of Kings. He holds out his hands, marked by the stigma, and at His feet sculptured angels bend with a chalice. Above and about the head are other angelic forms. On the north side is a life-sized statue of the Blessed Virgin, and on the south another of St. John the Divine.

Some time since the vestry of Fulham, with the help of the London County Council, laid out some 12 acres of ground adjoining Fulham Palace as a public recreation ground, and at the same time constructed a substantial embankment and wall on the river front at a total cost of £19,580. An opportunity has now occurred for the acquisition of two properties known as Thames Bank and Prior's Bank, adjoining Bishop's meadow, with the view of adding the land to the recreation ground. The market value of the two properties is estimated at £5,740, but the Ecclesiastical Commissioners offer it for £4,000, on condition that the land is used as an open space. The estimated cost of acquiring and laying out the ground, continuing the river wall along the front, and constructing an approach from Putney-bridge, is £10,000, towards which the Council will contribute £7,500.

DESIGNING OF STEEL BRIDGES, THEORETICAL AND PRACTICAL.—X.

WE may now proceed to take out the weights of the different parts of our bridge, so as to arrive at the total number of tons of steel required for its construction. Steel is rather heavier than wrought iron; but the difference is so small that, unless in very large girders, it may be either altogether neglected, or when the lump weight has been ascertained, a percentage may be added to equalise the slight difference, which may be thus obtained:—

Weight of a cubic foot of steel in pounds ..	499
Ditto ditto wrought iron ditto	486
Difference	13lb.
Weight of a cubic inch of steel in pounds	0·288
Ditto ditto wrought iron ditto	0·280
Difference	0·008lb.

Taking the average of these differences, it will be found that if 1½ or 2 per cent. be added to the total weight of steel estimated as if wrought iron, the calculation will be correct. This method, moreover, will allow of the use of one or other of the numerous tables which give the weights of plates, bars, angle and tee-irons, and other sections of wrought iron, which are not equally available for the same forms of steel. Although these useful and reliable aids to the estimation of quantities and weights save a very large amount of labour and unnecessary trouble, the architect and engineer should not accustom himself to rely altogether upon their assistance. It not unfrequently occurs, especially in foreign countries, that tables are not always to hand. Again, a professional man is often called upon for an approximate estimate of an iron or steel girder, roof truss, or other description of metallic framework, when he is away from his library and books of technical reference, and ought not to be at a total loss without them. There a few leading principles, and a few particular applications of them, which should be retained in the memory, and which will render the designer independent of tables and pocket-books when from one cause or another they are out of the way.

Let W equal the weight required for any unit of length L, in pounds, of any plate or bar, or, as will be subsequently seen, of any section of steel. Put c for the number of cubic inches in the section multiplied by the required length L, and in the case of plates and flat sections of steel make b equal the breadth and t the thickness, both of which, as well as the value of L, must be in inches. It will simplify future calculations, and will be on the safe side, since it will add very slightly to the actual total weight, to take the constant or weight per cubic inch of the ordinary quality used in the structures treated of equal to 0·288lb. A very good constant multiplier for converting weights of wrought iron into their equivalent values in steel is 1·02. According to the notation we have adopted, the value of W is—

$$W = C \times 0·288 \ldots\ldots (1)$$

but with a given length L—

$$C = L \times b \times t \ldots\ldots (2)$$

from which, eliminating C, we obtain—

$$W = L \times b \times t \times 0·288 \ldots\ldots (3)$$

Sometimes the unit of length adopted is yards, but as the foot is more generally employed, it will be retained in all future calculations. Inserting this value in (3) it gives—

$$W = 12 \times b \times t \times 0·288 \ldots\ldots (4)$$

Put A equal to the sectional area, in this case of course the gross sectional area, so that $A = b \times t$, and—

$$W = A \times 12 \times 0·288 = 3·45\,A \ldots (5)$$

Whatever may be the form of the section, this value for W will hold good. In estimating the weight of round iron, it must be remembered that

$$A = 0·7854 \times d^2.$$

The following memoranda will be of service in assisting calculation:—

Weight of cubic feet of steel in lbs.	499
,, ,, inches ,, ...	0·288
Weight of one lineal foot of any form of section of the area A	A × 3·45
Number of cubic feet of steel in 1 ton	4·48

Similarly for angle, tee, channel, *fer tubulaire*, or the Zores section, the rule is the same. The methods of ascertaining the sectional areas of these different forms of steel have been previously demonstrated, and we shall not, therefore, recapitulate. One word of advice we give. In estimating quantities and weights, always, while retaining a proper regard for accuracy and fidelity, estimate in a fair and generous manner. There is nothing so detrimental to the cause of good materials and good workmanship as a niggardly, cheeseparing system of estimating, which is, unfortunately, a great deal too often practised at the present day. While, on the one hand, there is no necessity for being either lavish or wasteful in either of these two details, on the other, it shows a lamentable lack of good sense and *savoir faire* when a specification is so stringent and an estimate so clipped as to render it literally impossible that good work could be done at the price and under the conditions stipulated for.

Estimates of quantities and weights are usually made on printed sheets of foolscap, which vary in the headings of the columns, and also in the degrees of minuteness with which the different descriptions of materials and workmanship are enumerated. Some architects and engineers prefer one kind of schedule or "form," and some another. The practice of each particular office regulates this, as well as numerous other details of a similar character. In the example before us, the number of the different materials used is very limited, which will greatly simplify the "form" in question. It should be borne in mind that all descriptions, dimensions, scantlings, weights, and other necessary items cannot be entered too fully or two clearly under their respective heads. There is nothing so annoying and so frequently the cause of trouble between the professional man and the contractor than to find, after the works are in progress, that a certain class of material and workmanship has been insufficiently and carelessly described, and estimated at too low a price. Such instances are by no means uncommon, and there are very few principals or heads of departments who have had the good fortune to be perfectly free of them.

ESTIMATE OF WEIGHT OF STEEL IN TONS FOR BRIDGE 60FT. IN SPAN.

Description.	Length in ft.	Scantlings in inches.	Weight per ft. in lb.	Total weight in lb.	Remarks.
One main girder.					
Upper flange—					
One plate	35	18 × ½	31	1,085	
,, ,, ...	45	18 × ½	31	1,395	
,, ,, ...	73	18 × ½	31	2,263	Over ends of girder.
Two angle-irons ...	73	4 × 3½ × ½	12	1,752	Ditto.
Four cover-plates..	5	18 × ½	31	620	
Two end ditto	2	18 × ½	31	124	
Two angle-wrappers	1½	3½ × 3 × ½	11	66	
Weight of one upper flange	......	....	......	7,305	3·261 tons.
Lower flange—					
One plate	63	18 × ½	31	1,953	
,, ,, ...	45	18 × ⅜	22¼	1,001	
,, ,, ...	35	18 × ⅜	22¼	779	
Two angle-irons ...	63	4 × 3½ × ½	12	1,512	
Four cover plates ..	—	—	—	620	
Two end ditto	3	18 × ⅜	22¼	137	Over bearings.
Two angle wrappers	—	—	—	66	
Weight of one lower flange	......	....	......	6,068	2·708 tons.
Web—					
One plate	63	56 × 5-16	60½	3,812	
Sixty vertical strips	5	5 × ⅜	6½	1,950	
Four angle irons over bearings ...	5	4 × 3½ × ½	12	240	
Weight of one web	......	....	......	6,002	2·68 tons.
One cross girder					
Upper flange—					
One plate	41	15 × ½	26	1,086	Over ends of girder.
,, ,, ...	16	15 × ⅜	19½	307	Plate at centre.
Two angle-irons ...	41	3½ × 3½ × ½	11¼	922	Over ends of girder.
Weight of one upper flange......	......	....	......	2,315	1·033 tons.
Lower flange					
One plate	36	15 × ½	26	936	
,, ,, ...	16	—	—	307	Plate at centre.
Two angle-irons ...	36	—	11¼	810	
Weight of one lower flange	......	....	....	2,053	0·916 tons.
Web—					
One plate	36	28 × 5-16	30¼	1,089	
Twenty vertical strips	2½	—	6½	303	
Weight of one web	.....	....	......	1,392	
Four connecting L-irons to main girder	3¼	3½ × 3½ × ½	11¼	146	
Weight of one web and connections		....	......	1,438	0·642 tons.
Eight steel joists...	60	5 × 4 × ¼	10¾	5,160	
Buckled plates......	...	—	...	16,320	
Parapet screens ...	...	—	...	4,460	
Weight of steel platform	....	....	....	26,940	12 tons

In the preceding estimate, although we have not yet published the elevation of the main girder, the separate items can all be obtained from the illustrations to previous articles, and the information given in the text. With respect to the total lengths of one of the plates in the upper flange, and of the horizontal angle iron, which are put equal to 73ft. each, it must be borne in mind that they are all carried over the ends of the girder and riveted together there, as shown in Fig. 15. It will be seen that the total weight of one main girder is alone taken out in detail, and then doubled for the pair. In the same manner the estimate for the weight of the cross girders is arrived at by using the proper multipliers.

FIG.15.

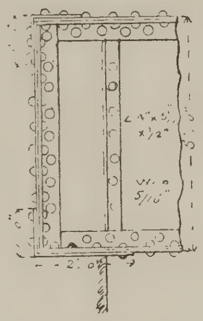

FIG.16.

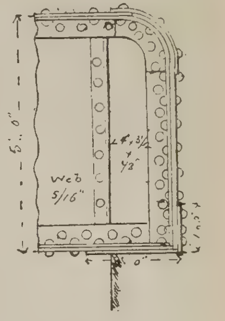

Before proceeding further with such explanations as may be necessary to enable our younger readers, for whose especial interest these articles are written, to thoroughly understand the "Estimate," it will be as well to explain Figs. 15 and 16, which will account for the apparent extra length given to the third plate in the upper and lower flanges. The former figure shows a right-angled termination to the girder, and the lengths of the separate vertical plate and the angle-iron of the flange at the back of the girder are added to the length of the regular flange-plate. A strip of plate, bent as shown in Fig. 15, covers the junction of the horizontal and the vertical plates, and may be riveted to it by the ordinary number of the rivets in the flange. The arrangement for the lower flange is somewhat different, as the similar strip of plate which has the same scantlings 18in. by ½in. is prolonged for a length of 2ft. under the lower flange. This extension is for insuring a uniform bearing on the bed-plate. It will be seen that the heads of the rivets on the under side of the plate are countersunk, and therefore do not show in the drawing. Another method frequently adopted for finishing off the ends of a plate girder is represented in Fig. 16, where the vertical piece of plate and angle-irons are rounded off with an easy curve. A strip of plate bent to the same radius as the angle-iron will suffice to cover the joint, and in some instances an angle-iron is used instead. Over the bearings the joint is arranged in the same manner as in Fig. 15. So far as strength is concerned, there is little or no stress on any of these parts of the girders; neither need appearance be considered, for the ends are invariably hidden in road bridges, by the parapets terminating the approaches.

If to the weight of one main girder in the estimate seven per cent. be added for rivets and small packing strips, the total weight amounts to 9·25 tons, as against 9 tons assumed for the trial weight. A similar calculation with respect to the weight of one cross girder and angle-iron attachment to the main girder, as shown in the cross section of the bridge in our last article, makes the total weight amount to 2·77 tons, as against 3 tons taken for the trial weight, which leaves a sufficient margin which will more than cover the small deficiency incurred with regard to the main girders. Summing up the weights of the several items, we have the following abstract:—

Two main girders at 9·25 tons	18·50
Nine cross girders at 2·77 tons	24·93
Weight of steel platform	12·00
Total weight of steel in bridge in tons ..	55·43

In point of absolute weight, the platform of a road bridge frequently compares very unfavourably with that of a railway bridge, since in the former it must be continuous over the whole area, but not necessarily so in the case of the latter structure. If the rails be carried on heavy balks of timber—that is, on continuous or longitudial sleepers, instead of on transverse sleepers—there is no need for any ballast, and all that is required is to provide some sort of a footway or a gangway for the platelayers to move about on. Even this scanty accommodation is often not available on railway bridges, and scarcely ever when they are erected in foreign countries and in out-of-the-way places at home. Owing to the exceedingly heavy loads—in some instances ridiculously ponderous—insisted upon by local authorities, even for structures which for size and traffic scarcely deserve the name of bridges, there is not so much difference between the absolute quantity of material, and consequently the weight, in a road or railway bridge as might at first be reasonably assumed. In fact, beyond the weight of the superstructure itself, there is very little additional dead load, and there is no necessity for making provision for the loading of the whole flooring of the bridge with a weight of so many pounds per square foot. In estimating the effect of a rolling load upon a bridge, it is not so much the actual amount of the load that has to be considered, as the ratio between it and the absolute or insistent weight of the structure itself. The greater the latter amount, the greater the resulting *vis inertiæ* of the entire structure, and the greater the antagonistic force which it opposes to the momentum or *vis viva* of a heavy passenger or goods train running at a high velocity.

CHIPS.

Lord Houghton has given a site for the erection of technical and art schools for Sandbach. The buildings to be erected are to be provided by voluntary effort.

The Duchess of Rutland opened a new building at Derby on Thursday for the Midland Deaf and Dumb Institution. The new structure is an extension of the old buildings, and has an elevation to Friars-gate. The buildings are three stories in height, and in the rear are schoolrooms and girls' and boys' indoor and outdoor gymnasiums. They have been constructed at a cost of over £13,000.

On Tuesday week Mr. Arnold Taylor, Local Government Board inspector, held an inquiry at Shepton Mallet with respect to the application for borrowing £1,350 by the local board for work at the sewage farm, and £1,000 for the completion of the public offices and rooms for technical education. Among those who took part in the proceedings were Mr. C. Hale, surveyor; Mr. Santo Crimp, sanitary engineer; Mr. G. J. Skipper, of Norwich, architect of the new public offices; and Mr. J. Jones, builder and contractor.

The Chelsea Vestry summoned the rent receiver of the house 32, Francis-street, Chelsea, to the Westminster Police-court, on Friday, for having allowed the property to become filthy and dilapidated. Mr. Sheil dismissed the summons so far as it related to whitewashing, painting, and similar renovations, the Act not empowering him to make an order for such repairs. The power for which the Vestry contended would enable them to enter a house and order it to be cleaned and whitewashed—really an enormous power. He made an order for the removal of stagnant water from the back yard.

The Marquis of Bute is carrying out some works of partial renovation at the ruined chapel of St. Blane, at the southern extremity of the Isle of Bute. The building has been measured and sketched by Mr. Schultz, architect, of Falkirk, and various repairs are being executed by the estate workmen. The ancient well near by has been excavated and cleared out.

The tracery of the east window of the parish church, Clifton, Tamworth, has recently been filled in with stained glass from the studios of Messrs. Jones and Willis, 43, Great Russell-street, London. The subjects thus illustrated are the Creation, Adam and Eve in the Garden, the Temptation, the Fall and the Expulsion from Eden, together with five other subjects, all from early Bible history.

The memorial-stones of a cottage hospital for Porth and district, in the Rhondda, were laid on Thursday in last week. The hospital is being erected on Cemetery-road, on an elevated position overlooking the Rhondda Valley. The building consists of two wards, each containing four beds, matron's room, doctor's room, nurses' day room, operating room, kitchen, and scullery on the ground floor, and private wards and bedrooms on the first floor. The building is to be of local stone, with red brick dressings for the front, the remainder of the external walls being cemented. The contract is being carried out by Messrs. Charles Jenkins and Sons, of Porth (the contract price being £2,529 10s.), under the superintendence of Mr. F. Gibson, architect, Midland Bank-buildings, Pontypridd.

Building Intelligence.

Ellesmere College.—The corner-stone of the new schoolroom was laid on Thursday in last week. The schoolroom is designed on the central-hall principle, with classrooms opening out on both sides. There will be ten of these, five on either side, each plastered with cement above, and having a dado of buff-coloured glazed tiles. The schoolroom will in length be 120ft., and in breadth 36ft. The height will be 33ft. 6in. to the wall-plate, and 45ft. to the apex of the panelling of the roof inside. This panelling will be of fir, and the roofing material to be used is green slate. The type of roof is of the hammer-beam style, with open tracery panels. The materials to be used are red brick and stone. Internally the room will be lined with brick, having its lower portion panelled with wood up to a height of 12ft. At the north end will be a gallery, capable of accommodating 100 people. There will be 18 windows along the sides, besides a large one of five lights at the south end. The heating will be by means of hot-water pipes. Externally, the schoolroom will be of brick, with stone dressings in the same style as the other college buildings. These already consist of a centre block with masters' rooms and dormitories, a wing containing further dormitory accommodation, classrooms, and the head-master's lodgings, and a dining-hall holding four hundred persons. The infirmary is isolated. When the schoolroom is built, there will still remain one wing (to complete the quadrangle, on one side of which is the dining-hall), the schoolrooms, and the chapel. Thirty thousand pounds have already been spent, and it is estimated that twenty thousand pounds more is required to complete the work. The school will then accommodate four hundred boys. Messrs. Carpenter and Ingelow are the architects.

Slindon, Staffs.—The Bishop of Lichfield dedicated on Friday a new church that has been erected at Slindon, near Eccleshall, at the cost of Mr. J. C. Salt. In dimensions the church is 62ft. 9in. from east to west, 16ft. in width across the nave, and 36ft. in width across the transepts. The church is cruciform in plan, consisting of nave, choir, sanctuary, and two transepts. The south transept contains seats for about 40 children; the north transept is to be used as organ-chamber and vestry. A low battlemented tower surmounts the space over the choir, which, as well as the sanctuary and porch, are covered by stone vaulting. The nave is covered by a queen-post roof, with large carved pateræ at intersections of the principal timbers. The material used is a mottled stone from Walford quarry. The style is that of the 14th century, and the windows are nearly all of different design in tracery. In the porch over the main entrance is a panel, with sculpture representing the Annunciation. In the south side of the sanctuary (externally) is a tracery-headed niche containing a figure of St. Chad, to whom the church is dedicated. The seats, choir-stalls, altar, pulpit, and litany-desk are all of oak. The local stone is used for the steps and pavement of the sanctuary. The work has been carried out by Mr. R. Bridgeman, of Lichfield, from designs by Mr. Basil Champneys, of 19, Buckingham-street, Strand, London. The cost has been £2,500. The east window is fitted with stained-glass by Mr. C. E. Kempe, and contains figures of Our Lord in the centre, and of the Virgin Mary, the Apostles St. John and St. James, and of St. Chad.

Stafford.—The foundation stone of the electric-light station was laid, on Friday, at Stafford, by the Mayor (Councillor G. Wormal). The contract for the main buildings was let to Mr. H. Lovatt, Wolverhampton, who is also the contractor for the county hall and the county technical buildings now in course of erection. The main buildings will be of red pressed bricks with Hollington stone facings, the interior of the dynamo-house being lined with glazed bricks. The dynamo-house is to be 82ft. by 45ft., and there will be three 120-horse-power condensing horizontal steam-engines, each to drive a dynamo, calculated to produce 300 ampères at 200 volts potential with a speed of 600 revolutions per minute. Adjoining the dynamo-house will be a boiler-house, in which there will be erected three Lancashire steel boilers, 7ft. 6in. diameter and 28ft. long. The chimney-stack will be 135ft. high, with capacity to accommodate eight boilers. The cables will be laid on the parapets, and inclosed in earthenware pipes. The supply will be on the three-wire system patented by Dr. Hopkinson, F.R.S., the adviser to the corporation; the outlay will be £15,000.

Starcross, Devon.—The parish church of St. Paul, Starcross, a Romanesque structure, was reopened on Saturday after renovation of the interior and re-seating. The high pews have been replaced by benches of pitch-pine, the passages being laid with wood block paving. At the western doorway an entrance lobby has been formed with pitch-pine framing, and swing doors. The roof-timbers have been painted, and the plaster ceiling between them tinted and divided into panels with stencilled border. The walls have been coloured. Pitch-pine stalls are provided for the clergy and choir westward of the chancel arch, the space occupied by the stalls being raised above the level of the nave floor, and laid with encaustic tiles. The organ has been rebuilt and a carved oak pulpit and lectern are in course of preparation by Messrs. Hems and Sons. Messrs. J. W. Rowell and Son, of Newton Abbot, were the architects.

The London County Council agreed on Tuesday to accept the offer of Mr. C. H. Read, of the British Museum, to superintend gratuitously the opening of the Tumulus on Parliament Hill. Mr. Read has recently been engaged in opening up the Anglo-Saxon cemetery near Worthing. It was reported that the preliminary steps have been taken towards widening Wood-lane, Hammersmith, at its junction with the Uxbridge-road, and the formation of a new street from Evelyn-street to Creek-road, Deptford, under the powers granted by the London County Council (General Powers) Acts, 1891 and 1894. A long discussion occurred with reference to the proposal to instruct the Public Health and Housing Committee to report "whether in certain cases the open gratings to the sewers in the highways constitute such a danger to the public health as to render it desirable that the Council should consider the question of whether a remedy can be provided." The resolution was ultimately adopted, but the Main Drainage Committee was substituted for the Public Health and Housing Committee.

The Corporations of Manchester and Salford have at present under consideration the question of deepening the river Irwell. It is proposed to deepen the river from the Ship Canal to Broughton Bridge. This will make it increasingly useful for the purposes of navigation, and the greater depth will also be the means of helping to carry off flood water, by the overflow of which much damage has been done to property on the river banks from time to time during past years.

The organ in St. Augustine's church, Edinburgh, one of the first introduced into the churches in Scotland other than Episcopal, was built by the firm of Messrs. Hamilton and Muller, in October, 1863. It was damaged by fire a few years ago, and has just been rebuilt and had extensive additions to it. The tubular pneumatic principle has been introduced, the whole mechanism has been modernised, and the pipes have been revoiced. The organ contains in all 1,228 pipes, of which 276 are newly added. The work has been carried out by Mr. Herbert King, organ builder, Edinburgh.

The Welsh Calvinistic Methodist Chapel at Prestatyn, built in 1864, having become inadequate for present needs, a larger structure is to take its place, the foundation stones of which were laid on Friday. The new structure will be in the Romanesque style. Provision has been made for the future introduction of a gallery, which would increase the number now to be provided for, 360, by 60 sittings. The front of the chapel will be faced with stone from Carreg Llwyd Quarry, Prestatyn, with terra-cotta dressings. Mr. Hugh Jones, of Morley-road, Rhyl, is the contractor for the work, which will be carried out under the supervision of, and from designs by, Mr. T. G. Williams, M.S.A., 3, Cable-street, Liverpool.

The historic mansion of Christchurch, Ipswich, has been purchased by Mr. Felix T. Cobbold, with the object of presenting it to the town of Ipswich, in the event of the purchase of Christchurch Park, which consists of 51 acres, being completed by the corporation, who are awaiting the sanction of the Local Government Board to give £16,000 for the property. Until Mr. Cobbold came forward, it was intended by the syndicate who have acquired the estate to demolish the mansion, and lay out the site and grounds for building purposes. We illustrated the mansion by a ground-plan and general perspective, and a sketch of the guests' bed-chamber, from drawings by Mr. J. Shewell Corder, of Ipswich, in the Building News for Aug. 25, 1893.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Glasgow Architectural Association.—At a meeting of this association, held in the Rooms, 114, West Campbell-street, on Tuesday week, Mr. A. N. Paterson in the chair, Mr. P. McGregor Chalmers, F.S.A.Scot., read a paper on "The Abbeys and Cathedrals of Scotland." He pointed out that local tradition is often interesting; but as a fabric reared by memory and imagination it can aid us but little where scientific accuracy is required. It might be thought that in the mass of literature published since Scott revived the interest of Scotchmen in the beauty of their own country and its history there would be found all the material necessary for the history of our abbeys and cathedrals. Closer acquaintance, however, convinces one that it is seldom more than a local tradition. The writers generally have been men of culture, but with few exceptions had no knowledge of art. When we turn to ancient charters we may think we have at last found some foundation; but the writings of past ages have been a most prolific source of error. An illustration in point occurs in the charters relating to the building of the central tower of Glasgow Cathedral, a part of the erection which is commonly attributed to Bishop Wishart. The lecturer proved, however, that this is erroneous, and that the tower really erected by Wishart, and restored by Lauder, was the north-western tower, so foolishly removed 60 years ago. It was a favourite practice for a local magnate or chief prelate to have his arms carved on the building erected or restored by him, and in this connection he argued that the arms of Archbishop Blackader, which appear on the remarkable aisle of Car Fergus, are not a record of building, but only of restoration. The presence of names or arms is not an infallible guide to us in our study—that infallible guide must be found in the art itself. Mr. Chalmers afterwards exhibited a series of views by limelight, covering the country from Kirkwall to Durham, and from St. Andrew's to Iona, arranged in chronological order.

Liverpool Master Builders' Association.—The members held their annual meeting on the 4th inst., at their offices, 6, Lord-street, Liverpool. Mr. J. Sirett Brown presiding. The report and accounts for the past 12 months were read and adopted, and the officers for the ensuing year were appointed, with Mr. Wm. Hall as president. The report states that the notices received from the various branches of the building trade for advances in wages, reduction in working hours, and alterations in trade rules have all been amicably settled, and that all the trades (with the exception of the masons) are now working to a uniform code of rules. Last autumn notices were received for a reduction of the working hours and an advance of wages from the bricklayers, plasterers, slaters, plumbers, and painters, and also from the bricklayers' and plasterers' labourers, and the committee considered this a good opportunity for endeavouring to effect such alterations in the general rules as to make them applicable to all the various branches of the trade. The masons and carpenters and joiners were working virtually the hours the other trades desired—viz., what is popularly called the nine hours' system—but to effect a uniform code of rules it was necessary to serve them with a notice of the proposed new rules, which was done. These rules were drafted by the committee and submitted to a special meeting of the association and approved of. The association has considerably increased the number of its members during the past year.

It has been resolved to establish a Society of Lady Artists for Wales. The first exhibition will be held next summer, in the Round Room, Conway, noted successively as a cockpit, Baptist Chapel, bandroom, and the studio of the late Mr. J. D. Dawson, R.W.S.

The city council of Coventry on Thursday adopted a report and plans by Mr. James Mansergh, C.E., for the disposal of the sewage by an extension of the present precipitation works and the filtration of the effluent on land in the Avon valley; the estimated cost of the scheme is £44,500, exclusive of purchase of land. At the same meeting a memorial from the Coventry and District Master Builders' Association was presented, asking for a revision of the building by-laws, with a view to render them more reasonable and workable, as at present they were obnoxious and irksome, and tended to discourage building enterprise. The memorial was referred to the general works committee.

Correspondence.

LOCAL BUILDING REGULATIONS.

To the Editor of the Building News.

Sir,—The case stated in my letter in your issue of Sept. 7, 1894 (p. 342), has, through your courtesy, been dealt with in your Legal column of Oct. 12, 1894 (p. 522), and is therein described as "an important and interesting question." I will, with your permission, therefore, continue the discussion.

Your solicitor (Mr. Fred. Wetherfield) considered that nothing can be done at law, on the assumption that the house mentioned was isolated, and 500 yards from the public sewer.

I must explain that this house is situated on the principal suburban road, and that between the point where the sewer ends and the house in question there is a row of detached and semi-detached houses; so that there is not a vacant building plot intervening, and, therefore, the house in question is simply the furthest of some 19 houses from the last house served by the public sewer. I may add that the rentals vary from £50 to £100, and that they are served by both the gas and water companies.

Now, your solicitor says that: "If there were a row or a street of houses . . . . the local authorities might probably be called upon to extend their scheme of drainage." Cannot my case be included in that category on the above explanation?

But I venture to push the question farther. Authority involves responsibility. Urban authorities may obtain the power to include large agricultural districts within their rateable areas. On doing so they become responsible for the sanitary condition of those districts. And, as property is rated *inter alia* to meet the expense incurred in removing sewage, the local authorities are *morally*—I will not say legally—bound to remove the sewage from every house in their rateable areas, whether by a public sewer or by the emptying of its cesspool. The former alternative applies to my case; the latter to an isolated house erected at such a distance off as to make the laying of a public sewer thereto an unreasonable expense to the ratepaying community.

This is my argument from the payment of sewer rates—an argument which does not postulate that each occupier pays rates in proportion to the sanitary service rendered to his occupation.—I am, &c., Surveyor

ARCHITECTURAL PHOTOGRAPHS.

Sir,—We have read with much interest the correspondence which has appeared in your journal *re* architectural photographs. As there seems to be a desire on the part of many to form a club of those who are interested in this subject, we may say that our committee suggest that there should be an amalgamation of forces.

The Central Photographic Club has been established about twelve months, mainly for the purpose of encouraging social intercourse between all classes of photographers.

Should the amalgamation take place, we think we could promise that the architectural section would have the exclusive use of one or two rooms, with a hearty welcome to the general club rooms.

Our committee will be pleased to meet any gentlemen interested in the question to discuss the matter further.—We are, &c.,

John H. Avery, } Joint Hon. Secs.
C. W. Gamble, }

The Central Photographic Club, Ashley's
Hotel, Henrietta-street.

Sir,—I was very glad to see the letter from Mr. Taylor in your last issue. We all know the energy of the A.A. when it sets its shoulder to the wheel, and I venture to think that, if the A.A. Camera Club were to throw open membership of the Exchange Society to *every* amateur photographer in the United Kingdom, it would prove a far greater success than merely keeping it among architects, photographers among whom must, of necessity, be limited.

My suggestion for working it would be as follows:—Let a scrap album, or albums, circulate, say, once every month among the members, each member, as it passes, pasting in one, or two, as the case may be, specimen prints, the negatives of which he or she must be prepared to lend, or print from, themselves, and at the same time choosing from among the prints already in the book those required in exchange (whether prints or slides), which might vary in size and number, according to each member's subscription.

The negatives of all prints asked for would be sent to the secretary, who would get the necessary prints or slides made therefrom by a professional photographer, at rates previously agreed upon, and return them to their owners.

As the scrap albums get filled with specimen prints from time to time, they would remain in the possession of the A.A. in return for the use of their rooms for meetings, &c., subject only to the inspection of members of the society.

This collection, embracing as it would little-known subjects from all parts of the world (though for postal reasons members would probably require to reside in the United Kingdom), would prove of incalculable benefit to future students of the A.A.

I think also that the exhibition proposed by Mr. Maurice B. Adams would act as a great impetus towards the formation of such a society.—I am, &c.,

A. Whitford Anderson, A.R.I.B.A.

TECHNICAL EDUCATION.

Sir,—We hear on all sides a great outcry on this subject, chiefly, as I believe, in consequence of neglect of the old system of apprenticeship, and various public bodies are indulging in schemes at the expense of the poor middle-class man, who pays for everything; but the strangest thing that I have heard of for a long time is that the governors of the North London Polytechnic think that after a man has acquired sufficient technical knowledge to act as clerk of works for their new building, he is worth £3 per week.—I am, &c., Observer.

CHIPS.

The city council of Bath adopted, by 23 votes to 16, on Tuesday, a resolution requiring that in all contracts over £5,000 contractors shall not sub-let nor pay less than the standard rate of wages. Similar motions have previously been brought forward at Bath and defeated; but many members of the city council stand for re-election on Thursday in next week.

New schools are now being erected at Courtney-road, Hull, and special consideration has been paid to the ventilation, which will be carried out on the Boyle system, the latest patented improved form of the self-acting air-pump ventilator being adopted for the extraction of the vitiated air.

The opening meeting of the sixty-first session of the Royal Institute of British Architects will be held on the evening of Monday week, November 5th, when an inaugural address will be delivered by the president, Mr. Francis C. Penrose, F.R.S.

A new clergy-house and Church institute, in connection with the parish of St. Mary, Haggerston, was opened on Tuesday last by H.R.H. the Duchess of Teck, attended by Hon. Mrs. Mitford and the Hon. S. Greville. There were present the Bishop of Bedford, General Sir O. Tanner, and a large number of local clergy. Mr. Richard J. Lovell, of 46, Queen Victoria-street, E.C., was the architect.

A large brewery is in course of erection at Blackburn, for the Blackburn Brewery Co., from designs by, and under the supervision of, Mr. James Bertwhistle, F.S I., of Tackett-street, in that town.

Mr. Gladstone, a short time ago, gave sittings for a portrait to the Cavaliere G. de Giovanni, an Italian artist, and a copy of the head in the form of an oval bronze has been accepted by the Trustees of the British Museum.

The second section of the new church of All Saints at Peterborough was opened last week. The building is in the Decorated style, and consists of a nave and south aisle.

Details of the new railway from Bristol to London viâ Bath and Andover, were submitted to a private meeting of influential citizens of Bristol on Wednesday. A committee was formed to further the project, and substantial financial support was promised. The scheme provides for a central station at Bristol, with access to the docks.

In our account of the new buildings at Leeds in our issue of 12th inst., we only mention that Mr. J. F. Ebner laid the mosaic at Yorkshire College for Messrs. A. Waterhouse and Son. Mr. Ebner has also laid all the oak floors at the Medical School on his patent hydrofuge system, and also the Roman marble mosaic, which was specially designed by the architect, Mr. W. H. Thorpe, F.R.I.B.A.

The fine Jubilee statue of the Queen, carried out by Mr. Alfred Gilbert, R.A., has at length been removed from its obscure and ignoble site on Castle Hill, Winchester, to a pedestal in the centre of the Abbey grounds in that city.

Intercommunication.

QUESTIONS.

[11236.]—**Colouring Deed Plans.**—Can any of your readers tell me if there is any chemical to make colour and Indian ink lay evenly on parchment. I have to colour plans on deeds, and owing to the oily nature of their surface, the result is unsatisfactory.—E. H.

REPLIES.

[11227.]—**Soundproof Rooms.**—"Q.'s" architect did not carry his remedy far enough. What is required is to break the connection between the flooring boards and the joists, and between the joists and the ceiling. This may be effected by nailing strips of inodorous hair-felt along the tops and undersides of the joists. It is advisable to chamfer the lower edges of the joists, which also affords a better key to the plastering.—J. T. Rea.

[11227.]—**Soundproof Rooms.**—Possibly the builder may have used some of the imitation "silicate cotton" lately foisted on the market, which, when tightly packed, would, no doubt, have pulverised, and ceased to be a non-conductor. Assuming, however, that the genuine article was employed, there would inevitably be some conduction of sound through the medium of the joists. The remedy, however, is simple. If "Q." fixes to existing ceiling Jones's patent combination slabs—i.e., plaster slabs lined with silicate cotton—he will have a complete insulation, and thus effectually protect himself from the noise overhead. All that the slabs require after being nailed up is a thin finishing coat of fine stuff or Keen's cement.—Clerk of Works.

[11227.]—**Soundproof Rooms.**—If "Q." has the floors perfectly pugged, and the noise is still heard, the only remedy that I can suggest—a very simple one—is that the frisky kitchen-maid be required to wear slippers in the house.—H. L.

[11227.]—**Soundproof Rooms.**—Cork felting is an excellent means of deadening sound. It is composed of pulverised cork, ¼in. thick, laid on a backing of coarse canvas, and used as a floor covering.—R. J. Angel, Birkenhead.

[11228.]—**Bills of Quantities.**—The recognised charge for quantities is 2½ per cent. except for works of a small troublesome nature; then the fee is one of arrangement. See the Royal Institute suggestions as to scale of charges.—R. J. Angel.

[11228.]—**Bills of Quantities.**—For a job of plain character the charge should not exceed 1½ per cent. Very few jobs exceed 2½ per cent. It may interest "Provincial" to know that the London School Board, while providing for a fair wage to the mechanic and labourer, cuts down the surveyor to 1 per cent. for new schools and alterations.—H. Lovegrove.

[11229.]—**Priming Internal Joiner's Work.**—Joiner's work can be knotted, stopped, and primed before it is taken to the building; but "Learner" should ascertain the quality of the material used prior to this operation, as priming, like charity, covers a multitude of sins.—H. L.

[11230.]—**Steel Gutters.**—This question is not very clear; but I should say that steel would last longer in any position.—H. L.

[11231.]—**Wasted Stone.**—The only remedy I know which is permanent, and is not a paint, is the "Fluate" process, sold by the Bath Stone Firms, Ltd., Bath. This process acts chemically upon the stone, does not hide the grain, or paint or varnish it; but leaves its natural appearance unaffected.—Constant Reader.

[11231.]—**Hot-Water Supply.**—The flow and return are usually the same size. The end of blow-off is usually free. Hair-plaster would do for covering, so would felt lagging.—H. L.

[11231.]—**Wasted Stone.**—A good deal of stonework about Liverpool has been treated with chloride of calcium and silicate of soda, and has been found successful in preserving the stone from decay.—R. J. Angel, Birkenhead.

[11232.]—**Domestic Hot-Water Supply.**—Theoretically speaking, the flow-pipe to a hot-water cylinder should be greater in diameter than the return since water expands 4·38 per cent. of its bulk when at its boiling-point—i.e., 212°; but in practice this is never done; both pipes are of an equal diameter, say 1in. or 1¼in. There is a great objection to the blow-off pipe dipping into the cold-water cistern in the roof, for should the water in the cistern freeze during winter-time, the steam outlet would be sealed, and an explosion would occur. The blow-off pipe should discharge outside the building, and be protected from frost by wrapping it round with felt.—R. J. Angel, Birkenhead.

[11234.]—**Staining Timbers.**—The object of priming joiner's work is to render the wood non-absorbent. It is usually done with oil-paint containing a good proportion of red-lead. A coating of this paint will prevent the subsequent coats from sinking into the pores of the wood. Size is sometimes used instead of oil-paint, but should not be allowed.—R. J. Angel.

[11234.]—**Staining Timbers.**—It is very much the custom now to leave the timbers of roof plain in modern churches; but in such a case it is essential that the best materials be used—and if possible, oak. It is many years since I have seen plastering between the common rafters of a new building intended for a church. Boarding has many advantages, and it has been found that if the common rafters shrink, the plaster becomes unsafe, and the necessary whitening spoils the appearance of the timbers.—H. L.

[11235.]—**Ash Vents.**—Questions are asked about these from time to time, and it would be well if "Doubtful" described what they are, their construction, and use.—H. L.

[11235.]—**Ash Vents.**—The old-fashioned ash vents at the back of the fire-grate are not desirable, as they form a conduit for cold air to obtain access to the chimney-flue, thus cooling the smoke and causing it to descend into the room. The modern firegrates have the opening above the fire as small as possible, and by doing away with all superfluous openings, cause the air to pass through the fire before reaching the chimney, which obviates a nuisance.—R. J. Angel, Birkenhead.

CHIPS.

During the hearing, at Birmingham, on Friday, of summonses by the corporation against Sir Alfred Gooch, Bart., requesting magisterial orders for the closing or demolition of a number of houses on his land, Dr. Hill, medical officer for the city, stated that there were in Birmingham at present no fewer than 10,000 houses absolutely unfit for human habitation.

A granite obelisk is about to be erected at Lutterworth, Leicestershire, to the memory of John Wycliffe, "the morning star of the Reformation." The cost will be £1,000.

The Paisley School Board have adopted the plans sent in by Mr. T. G. Abercrombie, of that borough, for the new Barbour Grammar School. The estimated cost of the building is between £18,000 and £19,000. In addition to the academy, a swimming-bath, gymnasium, and workshop will be erected at a cost of £5,000. It is to be erected at Crossflat, on the Glasgow-road.

At the Southwell Diocesan Conference, held at Nottingham last week, the Suffragan Bishop of Derby, on behalf of the clergy and laity of the diocese, presented the bishop with a pastoral staff. The stock was of ivory, with gold head and joints, and on it were two small figures of SS. Chad and Paulinus, representing the two archdeaconries united in the diocese.

Mr. E. E. Oliver has been selected to succeed Colonel Marshall as Chief Engineer and Secretary to the Punjaub Government.

Mr. J. Bowen, A.M.I.C E., borough surveyor of High Wycombe, Bucks, has been recommended by a committee of the Reading town council for the appointment of borough engineer. The other candidates selected and interviewed by the council (out of a total number of 111 applicants) were Mr. Thos. Reader Smith, A.M.I.C.E., of Kettering; Mr. Campbell, A.M.I.C.E., of Stratford-on-Avon; Mr. Witts, of Leeds; Mr. F. W. Howard, of Reading; and Mr. W. Jane, of Reading. Mr. Jane acted as borough engineer during the period of about three months since the appointment of the late borough engineer, Mr. Collins, A.M.I.C.E., to the city engineership of Norwich.

The church schools, Wrangthorn, Leeds, are being warmed and ventilated by means of Shorland's patent Manchester stoves, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

The Harwich school board have given instructions to Mr. J. W. Start, F.S.I., architect, of Colchester, Clacton-on-Sea, and Harwich, to prepare plans for an infants' school, to accommodate 150 children, at Lower Dovercourt, this being the second block of buildings undertaken by the board.

It should not be forgotten that to Lord Basing (better known as Mr. Sclater-Booth), who died on Monday, we owe the carrying through Parliament of the important measure for consolidating the sanitary laws, recognised as the Public Health Act of 1875, and also the Rivers' Pollution Act of the same year.

It is proposed to make an additional entrance to Brockwell Park, at the north-eastern corner leading from Arlingford-road. The purchase money for the land, with the legal costs, will amount to between £6,000 and £7,000. The Lambeth Vestry having agreed to contribute one-third of the cost with a maximum contribution of £2,000, the London County Council will be recommended next week to carry out the improvement.

The memorial-stone was laid on Saturday of a new school to be erected in Gorton by the Manchester School Board. The school will have accommodation for about 1,200 children, and is to cost, with the ground, £15,750.

At the Torquay police-court on Saturday, Thomas Cridiford Matthews, a bankrupt builder, of Babbacombe, was charged with setting fire to his house in Fore-street on the previous evening. Prisoner was remanded, in order that his mental condition may be reported upon.

A new gasholder, with a capacity of 5,250,000c.ft., has just been completed at the Meadow-lane Gasworks, Leeds, by Messrs. Clayton, Son, and Co., of Leeds, and its formal opening took place on Monday. The diameter of the holder is 240ft., and when full it will have an elevation of 120ft. exclusive of the base, which is about 15ft. above the ground. The completion of this holder increases the storage capacity of the city to 16,250,000c.ft., and the gas committee hope that they will now be able to dispense with Sunday labour at the gasworks.

Legal.

THE SETTLED LAND ACTS.

ALL who are interested in land and building are more or less concerned with the working of the Settled Land Acts, for it is by means of these statutes that many estates come upon the market and, by falling into the hands of men with money to spend, bring about business. As long as a tenant for life had no method by which he could do anything with the property except at his own expense, there was little hope of its improvement or development. Now that, by reason of the change made in the law, the tenant for life can sell, with the consent of the Court, subject to the due investment of the proceeds for the benefit of those who will come after him, such sales are likely to become more and more common as the existence of this power becomes more widely known. In the general interest, it is, however, most important that there should be no practical difficulties or awkward objections placed in the way of the tenant desiring to sell, because such things are likely to hamper that free transfer of landed property which it is in every way desirable to encourage. From this point of view the decision of the Court of Appeal in the recent case of "Smith v. Lancaster" (*Times*, Aug. 9), seems to us unfortunate.

There, the "tenants for life," as defined by the Settled Land Act of 1882, was found to comprise 25 persons as parties interested in the income, and so together constituting their legal entity. A sale of the settled lands was agreed upon, however, and they all consented to let one solicitor act. This solicitor accordingly conducted the sale on behalf of all these parties, and his name appeared only as vendors' solicitor upon the particulars of sale. But after the sale four of the parties employed separate solicitors of their own, in whom they had confidence, to peruse the defendant conveyance and complete the purchase. When it came to taxing the costs and allowing them out of the proceeds, Mr. Justice Kekewich held that only one set of costs could be permitted, and he disallowed the costs of the four parties who had thus been subsequently represented, on the ground that they were not entitled to do so. They now appealed, and the Lord Chancellor, with Lords Justices Lindley and Davey, allowed the appeal, and reversed the order of the Court below. This was done on the ground that the Act did not compel all the persons who together constituted a legal tenant for life to employ the same solicitor, and therefore each one of them was entitled to be separately represented. In this case, therefore, there might have been twenty-five solicitors. But as all these costs come out of the proceeds, the result must be to seriously hamper the popularity of sales under the Settled Land Acts.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

Electric.—Shop-front.—Bylaws.—The Local Board seem to be wrong, upon your statement. You might complain to the Local Government Board by a letter setting out your facts, and you could apply to the Queen's Bench for a *mandamus* against them; but that is expensive and doubtful.

Whilst employed upon the extension of a mineral-water factory at Blackpool, on Tuesday morning, three men were badly injured through the collapse of arches which had been used for the support of concrete flooring between girders. Richard Preston, a bricklayer's labourer; George Perry, foreman of the factory; and William Johnson, another of the firm's employés, were all severely cut about the head and body, while Preston sustained serious internal injuries.

Extensive alterations and improvements are contemplated at the Theatre Royal, Jarrow. At present the whole of the ground floor is occupied by business premises and billiard-rooms; but after the reconstruction the pit will be on the ground floor, and the means of exit will be improved. On the first floor will be the boxes, ladies' and gentlemen's rooms, and the accommodation for the artists will be largely increased. Previously the theatre held 1,100 persons, but in future the number will be 1,400. The interior is to be entirely redecorated. The estimated expenditure is £4,000, and the work will be carried out from the designs and under the supervision of Mr. Albert P. Farthing, architect and surveyor, Pilgrim-street, Newcastle-on-Tyne.

LEGAL INTELLIGENCE.

Frontage Lines on Building Estates.—Stainer v. Masterman.—At the Christchurch (Hants) County Court, on Oct. 16, before Judge Hooper, the case of "Stainer v. Masterman," remitted from the Chancery Division by Mr. Justice Kekewich, was heard. The South Coast Freehold Land Society possessed a piece of freehold land at Christchurch, known as the Fairfield Estate. The estate (consisting of 55 plots) was apportioned by ballot in March last among the members of the society. A moiety of plot No. 1 was sold to Mr. Stainer, the plaintiff, and Mrs. Masterman, the defendant, became the owner of plot No. 3. It was a building estate sold in plots under the same conditions, the allottee of each plot being bound to regard a uniform building line. In June plaintiff observed building operations on defendant's land, a trench being dug out for the footings of the wall, indicating a transgression at one end of the plot of over 3ft., and at the other 4ft. or 5ft. He wrote to defendant, threatening proceedings. The owner of the intermediate plot had given a written consent; but plaintiff was never asked for his written consent. The same day, Mr. Tiller, jun., who was acting as builder and architect for plaintiff, wrote and had a conference with defendant, with a view to a compromise, suggesting that one of defendant's houses should be kept out as proposed, and the other kept back to the proper building line. Defendant, however, emphatically declined to compromise, and the directors of the society decided not to enforce the conditions as to the building line. Plaintiff again wrote to defendant, who said she should go on, as the directors had consented, and the premises were now roofed in. Plaintiff now applied for an injunction and the assessment of damages. Affidavits were read, made on plaintiff's behalf by Mr. Corbin Harris, surveyor, Bournemouth, and by Messrs. Thomas Tiller, senior and junior, builders, as to the damage to plaintiff's property by the want of symmetry in the building line. The defence was that plaintiff had verbally acquiesced in the defendant's proposals, that no other allottee objected, and that he would sustain no damage by the changed building line. The witnesses for defendant included Mr. William Webster Ebrall, surveyor, of Bournemouth, and Mr. William Horsey, the builder of defendant's houses. Plaintiff's counsel quoted "Gascoigne v. Balls"—a strong one, he said, in which there had been five years' acquiescence. The judge said he should make no mandatory injunction in this case. Defendant had proceeded with her building under a misunderstanding; but he could not believe plaintiff had suffered any damage. No allottee had a right to break the covenant regarding the building line, which was binding on all. He should, therefore, give judgment for the plaintiff, without damages. He made no injunction and order as to costs.

Wrongful Conversion of Bricks.—At the Walsall County Court, on Friday, before Judge Griffiths, George Pedley, licensed victualler, Brewood, sued James H. Edwards, formerly of Walsall, now of Bournemouth, for £25 damages for the wrongful conversion of bricks sold by the defendant to the plaintiff. The bricks, numbering about 70,000, were stacked on land belonging to the defendant, in Bentley-lane, at the end of 1892, when the sale and purchase took place, and the plaintiff paid £39 10s. for them. Subsequently the land changed hands, and the plaintiff, who had taken away only 12,000 of the bricks, found that all the others had disappeared. It then came out that defendant had sold about 30,000 of them to Mr. W. Lowndes, brick manufacturer, Bloxwich, for £8 10s., and had got Mr. Jabez Cope to take another lot of 7,000 in payment for rent, to the amount of £3 11s. 3d. The other 21,000 could not be traced. The defence was that the plaintiff had authorised the defendant to sell the bricks for him, and that the money would have been paid over promptly but that the plaintiff had circulated reports prejudicial to the character of the defendant. His Honour gave judgment for plaintiff for £18 10s.—being for 37,000 bricks, at the rate of 10s. per 1,000—and costs; and assumed that those unaccounted for had been stolen by unknown persons.

The Collapse of Scaffolding at Plymouth.—The inquest on Mrs. Rowan, of Plymouth, who died from injuries and shock sustained through the collapse of a "platform" on the occasion of the laying of a memorial stone at a Plymouth Wesleyan Sunday-school on the 3rd inst., was resumed on the 18th inst. Nearly fifty persons were injured by the accident, one lady being still in a critical condition. The contractor for the new school, Mr. Thomas May, of Coburg-street, Plymouth, stated that the so-called platform was merely a scaffold erected for the accommodation of his workmen. On behalf of the chapel trustees, it was alleged that the scaffolding was offered to them by the contractor's foreman for the accommodation of ticket holders. Nothing, it was stated, was said as to its insecurity, or the desirability of limiting the number of people who should use it. This statement was denied by the contractor and his foreman, Mr. William Nancollas; but the latter admitted having stated in conversation with a trustee that twenty people might be put upon the scaffolding. As a matter of fact, any person who chose to pay sixpence for a platform ticket seems to have been allowed to get upon the scaffold, so long as he could find standing room.—The inquiry was adjourned.

Curious Party-Wall Dispute.—At Folkestone County-court, on Tuesday, His Honour Judge Selfe tried the case of "Mackenzie v. Tunbridge," a claim for £11 5s., half the cost of a party-wall. The facts were that Mr. Jenner, a builder, erected a house on a plot of land purchased by him from the Kent and Sussex Land Society. One of the conditions was that he was to build the party-wall half on his own plot and half on the adjoining plot, the purchaser of which would be bound to pay half the cost. When Mr. Jenner had built his house he sold it to Mr. Mackenzie. Mr. Tunbridge purchased the adjoining plot and erected a house on it, using the party-wall, for which he was willing to pay. But there were two claimants for the money. Mr. Mackenzie demanded it, and Mr. Jenner also, the latter contending that he only sold what was on his plot, and not the half-wall on the adjoining plot. His Honour decided that as Mr. Jenner made no reservation of his right to the half party-wall, he conveyed to Mr. Mackenzie all his interest in the building, and therefore Mr. Mackenzie was entitled to receive. Mr. Martyn Mowll, who appeared for the plantiff, asked for a special solicitor's fee of one guinea to be allowed, as it was a case which had involved a good deal of work and a good deal of investigation. His Honour allowed the special fee, remarking that it was a case in which counsel might reasonably have been employed.

In re Young and Buss.—H. W. Young, O. Buss, and C. W. W. Young, recently carrying on an extensive business as wholesale ironmongers in Hill-street, Dorset-square, and Blenheim-street, Bond-street, under the style of "Buss and Young," have furnished accounts showing their liabilities to be £13,180, of which £7,249 are unsecured, with assets £4,691, subject to preferential claims £208. The debtors state that their business was founded fifty years ago by Mr. John Young, the father of the debtors H. W. and C. W. W. Young. About 1864 Mr. John Young was joined by the debtor Buss, an arrangement being made whereby Mr. Young's capital of £7,600 was to remain in the business at 6 per cent. interest during the lifetime of Buss. H. W. Young brought no capital into the business. His partner's share was taken at £1,000, and he also introduced a further sum of £500. The Official Receiver (Mr. A. H. Wildy) says it further appears that in 1887 the debtor C. Young was admitted into the partnership, and contributed nothing to the capital. About 1893 Mr. J. Young died, and the sum left by him in the business became, under the terms of his will, the joint capital of the debtors H. W. and C. Young. The debtors attribute their insolvency to loss on trading arising from (1) bad debts, (2) general shrinkage in trade profits, (3) realisation of stock, and also to depreciation in the value of the present stock as estimated for realisation. Mr. H. W. Figg, metal-trades valuer, is trustee of the estate, with a committee of inspection.

CHIPS.

Mr. Ebenezer Levi Montefiore, the director of the National Art Gallery of New South Wales, died suddenly at Sydney on Monday last, in his 75th year.

The annual conversazione of the Dundee Institute of Architecture will be held in University College in that city on the evening of Saturday, November 10.

The Portsmouth Town Council had brought before them on Tuesday a new scheme of railway development, which is being promoted by certain landowners of Hampshire. The proposed new line will be from Portsmouth to Basingstoke, *viâ* Waterlooville, Meonstoke, and Alton, with a branch from a point near Meonstoke, to join the Didcot and Newbury Railway at Winchester.

Tenders have been received by the town council of Edinburgh for the reconstruction of the well-known North Bridge; but pending inquiries now being made by the engineers, Messrs. Cunningham, Blyth, and Westland, no name has at present been recommended for acceptance. The list has not yet been published, but it is understood that the lowest tender is about £82,000.

Extensive oil-mills are being erected at the south end of Liverpool by the African Oil-Mills Company. The buildings occupy the site of the old Southern Hospital and St. Barnabas' Church, and will cover the ground lying between four thoroughfares—Parliament, Greenland, Flint, and Chaloner-streets. The mill will be of fireproof construction, will cover 85ft. by 56ft., roofed in one span, and will be two stories in height. Separated from the mill are oil-tanks and a warehouse six stories in height. The works will be lighted by electricity. The buildings will be faced with red bricks.

STATUES, MEMORIALS, &c.

Salford.—The Duchess of Buckingham and Chandos unveiled on Saturday two pictures in mosaic which have been placed in the chancel of St. Clement's Church, Salford. The pictures are a second instalment of a scheme for the complete decoration of the chancel with scenes from the life of Christ. Some time ago a large representation of the Crucifixion was placed over the altar, with figures of St. John and St. Clement on either side. The two new designs, which are on the north side of the chancel, represent the Annunciation and the Nativity. It is intended to fill the two panels on the south side with representations of the Burial and the Ascension. The work has been executed by Messrs. Doulton and Co., from designs by Mr. Pearce, one of their own artists, and under the supervision of Lord Egerton and Canon Scott. The painting is on terracotta, and burnt in so as to render the colour indestructible.

WATER SUPPLY AND SANITARY MATTERS.

Leicester.—The water supplies of Leicester, Melton Mobray, and Ashby-de-la-Zouch have been curtailed to eleven hours per day. At Leicester further auxiliary supplies are being arranged for, amounting to about one million gallons, in addition to those already in operation. If these new sources are available at the time, and yield the quantities anticipated, there will not be any further curtailment of supplies till December 1, but if a heavy rainfall does not occur before then, a further curtailment will be necessary, although it is estimated that the auxiliary supplies will have then reached two million gallons per day.

Portishead.—Mr. Arnold Taylor, deputy chief inspector to the Local Government Board, held an inquiry at the Assembly Hall, Portishead, on the 19th inst., the Portishead Local Board having applied for sanction to borrow £14,000 for works of sewerage and sewage disposal. Mr. J. C. Oldye, clerk to the board, said that there was no proper system of drainage at Portishead at the present time; the assessable rateable value is £11,715; the acreage of the district 976 acres, and the number of houses 550. Mr. T. J. Moss Flower, of Carlton-chambers, Bristol, the engineer for the scheme, read a report on the present condition of sewers at Portishead, and pointed out that there were many ill-constructed sewers and drains, and that the drainage was as bad as it could be. He proposed to construct about eight miles of pipe sewers; the sewage from the low-level would be lifted at two points automatically into the high-level gravitating sewers, and the whole of the sewers on the low-level would be made perfectly watertight. The sewage from the high-level and low-level will be taken out to sea, and will be discharged at high-water. The outfall will be constructed of 15in. cast-iron pipes, supported on lines of elm piles, and taken out to a point below lowest water of lowest neap tides. The storm water would pass into the existing system of drains, which were to be repaired, cleansed, and extended where necessary. A large number of ventilating columns and shafts up the side of the houses will be erected throughout the system. The inspector remarked that they might take it there would be a large sum required for private-house drainage in addition to the £14,000. He pointed out to the local board the desirability of enforcing the proper reconstruction of defective house drains under close supervision. Subsequently the inspector, in company with Mr. Moss Flower, inspected the district, and expressed his opinion that without a doubt the district badly required draining, and it appeared to him that the scheme proposed well met the requirements of the case.

In memory of the late Prebendary Roe, Diocesan Inspector of Schools, it is proposed to erect a two-light stained-glass window in Wells Cathedral, with a suitable brass.

A marble portrait bust of the late Dr. Robert Harvey, which has been presented to Aberdeen University, was unveiled on Tuesday, by the Marquis of Huntly, in the Upper Hall of Marischal College. The bust is the work of Mr. Joseph Whitehead, London, and was exhibited at the Royal Academy.

The Lord Mayor visited on Wednesday the Royal Free Hospital, Gray's Inn-road, to inspect the new front which has been erected there at a cost of about £28,500. From time to time considerable sums of money have been expended in endeavouring to maintain the old front erected in 1842; but the structure became so dilapidated that the committee had no alternative but to rebuild it. The work was commenced in June last, and includes new front building and laundry, together with the reconstruction of the drainage, fire-extinguishing appliances, and other improvements. In the new front are isolation wards, casualty-room, a dispensary, board-room, offices, and rooms for the resident medical officers and servants.

Our Office Table.

At Tuesday's meeting of the City Commission of Sewers, the Streets Committee submitted a report by the clerk and solicitor relative to the proceedings of Mr. Power, a district surveyor, under the Sky-Signs Act, in reference to signs which, in the opinion of the committee, were not sky-signs within the meaning of the Statute. They advised that the report should be communicated to the London County Council, with the suggestion that that body should call on the surveyor to refund the fees exacted—illegally, as they held—by him, as, although Mr. Power, as one of the district surveyors of the City, was the statutory officer in regard to sky-signs, the Commission had no control whatever over him or the fees, which were paid to him direct. This was agreed to.

The Norman Castle at Norwich, which for five centuries had served as a prison, was disused for that purpose ten years ago, and has now been fitted up by private munificence as a city museum and fine art gallery. The alterations have been made, and the new buildings erected and fittings provided from plans by Mr. Edward Boardman, F.R.I.B.A., of Norwich. Among the special contents of the institution are an almost perfect collection of raptorial birds, largely the gift of the late John Henry Gurney, a rich collection of fossil mammalian remains from the forest bed of the Norfolk coast, an archæological and geological collection presented by Mr. Fitch, and some interesting examples of the famous Norwich School of Painters, presented by the East Anglian Art Society, Mr. Colman, M.P., and others. The museum was inaugurated by the Duke and Duchess of York on Tuesday.

At Tuesday's meeting of the Police Commissioners of Glasgow, a discussion arose on a proposal of a committee to pay Messrs. Cunningham, Blyth, and Westland, civil engineers, of Edinburgh, £5,000, in full settlement of their charges for preparing plans for rebuilding Glasgow Bridge. Several members objected to pay such a sum for what they characterised as "paper work"; but it was pointed out that, by the customary scale, the engineers were entitled to £7,000, and that the sum agreed upon between them and the committee was a substantial reduction. Eventually the recommendation was adopted.

Lecturing at the Museum, in Manchester, on Saturday afternoon on "Prehistoric Civilisation in Western Europe," Professor Boyd Dawkins described the characteristics of the Neolithic age and people. He showed that the new-comers, travelling from Central Asia, represented an important advance in the arts of life as contrasted with Palæolithic man as evinced by their tools, weapons, and household utensils found in the caves of England and Wales, and in the lakes of Switzerland. In this age attention was given to husbandry and the rearing of cattle; the occupation of weaving, pottery, and mining were practised, and the foundation laid of the civilisation of the present day. The evolution of the axe, saw, pick, knife, and scissors was traced, and also that of the dressing comb from the primitive instrument (with the teeth at one end) originally employed in the art of weaving. The nearest descendants of the Neolithic people, in Mr. Boyd Dawkins's judgment, are the Basques of Spain and Portugal, the names of whose working tools point backwards to the time when they were a stone-using people. The invasion of Western Europe by the Celts, a more physically powerful people, who were provided with instruments of bronze and who had a better idea of social and national life, was also referred to.

Miss Anna Lea Merritt, the well-known artist, describes Adolf Keim's method of decorating mural surfaces, as it has been adopted on the interior walls of St. Martin's Mission Church, in Blackheath, near Chilworth, a small building designed by Mr. C. Harrison Townsend, F.R.I.B.A. The wall surfaces are so prepared as to eliminate lime almost entirely. The painting ground consists of marble dust with a proportion of infusorial earth. This, after being laid on the roughcast, is so treated as to become very porous and firm of texture. The painting is done with colours ground in distilled water, and only chemically pure water may be used. The pigments are of a wide range and fine quality. The colours are finally set by a series of careful applications of a kind of silicate, applied very gradually and with reference to the various absorbent qualities of special colours. When the fixing is complete, the surface is exceedingly hard. It requires great force to break it, and the painting, which has no gloss, but a granulated surface, may be washed freely, or will even resist exposure to rain and open sunlight. The preparation of the walls at St. Martin's, Blackheath, was done by a country builder, following the directions given from Munich.

An inquest was held at Birmingham on Friday last, touching the death of Thomas Smith (49), painter, who was killed by a fall from the scaffolding in Smithfield Market in that city on Wednesday last. Deceased, while with others, engaged in painting the interior of Smithfield Market, was walking along a temporary platform—consisting of two planks resting on scaffold work—when he slipped between the planks and fell to the ground. His fall was broken by a linen net suspended to catch any débris, but the material was not sufficiently strong to bear the man's weight. He dropped head foremost a distance of 41ft., and died instantaneously from a fractured skull. Mr. Breakspear, a member of the firm in whose employ the deceased was, and two or three witnesses stated that the platform was constructed in the usual manner, and one workman added that there was no danger if proper care was taken by the painters. The jury returned a verdict of "Accidental death," and the Foreman added that, while they were of opinion no blame attached to anybody, they strongly recommended the Association of Master Painters and Decorators to ask the trade to provide netting of such strength as to prevent similar accidents. Mr. Breakspear expressed his regret at the accident, and said that, as no provision was made in the estimate of the contract with the Corporation for such a netting as was suggested, perhaps the Corporation would contribute something towards its cost.

The town council of Glasgow discussed at their last meeting the recent policy of the City Improvement Trust, in connection with a recommendation that plans for further house property be approved. It was complained that the trust are building palatial residences for a population that they have not dispossessed, and further that the rents of the new houses thus provided by the trust are too high for the poorer classes of people. It was stated that during the past five years the Improvement Trust had demolished 311 houses rented at or about £5; 255 houses above £5 and not over £10; and 27 houses rented at £10; and they were putting up in their place at the present time single-roomed houses rented at £6 16s. to £8, room-and-kitchen houses at £9 18s. to £11 5s., and two-room houses at £15 to £22 10s. Eventually the plans were approved, and the proposed buildings will consequently be proceeded with.

Under the auspices of the Sanitary Inspectors' Association several courses of lectures to sanitary officials are being given at the rooms of the Society of Architects, St. James's Hall, Piccadilly, S.W. On Monday evening last Professor Vivian B. Lewes gave the second of a series of five lectures on "The Atmosphere — its Sanitary Relations," and the course will be completed in three other addresses to be given the next three Monday evenings at 7. 30p.m. On the evenings of Saturday December 8 and 22, Mr. E. Tidman, M.S.A., will explain the "Details of Modern House Drainage"; and on alternate Monday evening's in the spring of 1895, lectures will be given by Mr. S. G. Fairchild on "Details of Plumbers Work," by Dr. J. J. Piller on "Food and Feeding, Air and Breathing," and also on "Discretion and Disinfection," by Professor E. M. Crookshank on "Microbes."

MEETINGS FOR THE ENSUING WEEK.

Monday.—Sanitary Institute Lectures. "Ventilation, Warming, and Lighting," by Sir Douglas Galton, F.R.S. 8 p m.

Tuesday.—Society of Architects' Annual Meeting. The Report of the Council on the Examination for Membership Question will be submitted and considered. St. James's Hall, Piccadilly. 8 p.m.

Wednesday.—Carpenters' Hall. "Sanitary Building Construction," by Professor Banister Fletcher, F.R.I.B.A. 8 p.m.

Sanitary Institute. "Principles of Calculating Areas," by H. Law, M.I.C.E. 8 p.m.

The Society of Architects.

Founded 1884. Incorporated 1893.

The ANNIVERSARY MEETING of the Society of Architects for the Session 1893-4 will be held at the Society's Rooms at St. James' Hall, Piccadilly, W., on TUESDAY, OCTOBER 30th, at Eight o'clock p.m., when the Election of the Officers and Council for the year 1894-5 will take place; and the Report of the Council on the Examination for Membership will be laid before the Members.

ELLIS MARSLAND, Hon. Sec.
A. MONTEFIORE, Secretary.

By a majority of two in a thinly attended court, the City Commissioners of Sewers adopted, on Tuesday, a report recommending that a Bill be promoted next session to give powers to erect a crematorium in the City of London Cemetery at Ilford.

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXVII.—No. 2078.

FRIDAY, NOVEMBER 2, 1894.

BOOKS AND BUILDINGS.

TWO ways of teaching architecture may be summed up as teaching by precept and example. It is comparatively easy to frame a set of rules or precepts from a limited experience. The man who builds a house may be able to write down a few rules and suggestions that may be tolerably correct and fairly useful; but it is quite evident he cannot frame such a useful or reliable code as the man who has erected a score of houses or has spent a lifetime in dwelling-house construction. And the same may be said of anyone who writes a book on school or hospital construction from a few buildings, or of a man who writes a book on construction or sanitary matters from a very limited experience indeed. Then we have a set of men who are simply compilers, often copyists, and publish books upon various art subjects or technical questions, about which they know very little except what they have read in other books of a similar kind, just for the sake of advertising themselves. These "authors" are often mere prigs, and simply repeat what others have said, but in a less meaning sort of way. The book-instructed man is liable to fall a victim to this sort of teaching by precept—to learn a few superficial things at a great sacrifice of truth. The one exists for the other: the book reader must have books, and the man who "makes" books is ready to supply the demand. Of course, we are not speaking of all books, for there are many that are invaluable to the architect and the student, which have been written by men who have had a wide experience of buildings as well as students of literature; but we speak of the plethora of books which pretend to give instruction, and to lay down rules and directions from a very partial experience. The "precept," or the book system of equipment for the profession is essentially a modern method, very popular just now, and may be represented as the school method of instruction. But there is a danger in it. It saves thinking; the student, if of a receptive order of mind, readily accepts all the author says; every proposition receives assent, and the reader is all the better or all the worse for this kind of cramming, just, in fact, as it is true or false. We know architects who have taken their views and opinions on architecture generally from Fergusson's "History," who have accepted his views as to style; others who pin their faith to Scott or to Street's teachings—all excellent in their way, because men who had studied widely and who knew something about what they wrote. There is the mischief, however, of such students accepting too readily the opinions and teachings of authors of a very different calibre, of not inquiring of themselves whether there is another and opposite view of the question. In this way books rather stifle than promote inquiry.

We have such a thing as book architecture. The author of this kind of work draws his inspiration entirely from the illustrations of designs or old work he sees in books, just as others follow the directions given in sanitary and other manuals in carrying out such work. Not being able to dispute the author, they slavishly follow him in all his directions, and wonder afterwards why the work is a failure. The book-rule, in fact, is much stronger now than it was in the days of the Revival, when only a few great works were issued, like those of Stuart and Revett's "Antiquities of Athens," the Dilettanti publications; and in Gothic the works of Britton, of Pugin, of Dallaway, of Billings, of Paley, Sharpe, Nash, and others. Each of these had its influence upon style; but now there are hundreds of authors who pose as authorities on every conceivable branch: the student is overwhelmed by books on construction, technical subjects, hygienics, and so on, and he is supposed to go through a course of reading, after which he is assumed to be fully competent to act as an architect. No doubt there is a certain safety in number; it is better to trust three or four authorities on a given subject than only one; but the question arises how far the book-rule is to govern the rising architect in his choice of models and plans. A book can only be used as a skeleton—an outline—but the tissues and life must be obtained from personal observation and practical work. The practical mind can alone fill up the bare outline of the author, the experience obtained from actual building, from contact with manufacturers and craftsmen.

We must look rather to the clinics of architecture, the study of buildings, for any real help. Just as the surgeon or physician studies disease at the bedside of his patient, so must the architect try to discover the actual requirements of his profession from buildings. This is the old way, the way which all the great architects of the past pursued who had no books to refer to, when the literature of the art had scarcely become known. As Professor T. Roger Smith observed the other day in his inaugural lecture at University College, architecture can be better learned from buildings than from books. But we are afraid this source of information is being lost sight of. The output of modern literature has been so great, that there is danger of the younger generation of architects placing too much reliance on book study—first, because it is easier; and second, because it supersedes the study and observation of buildings. The courses of lectures on architecture, valuable as they are, naturally encourage the study of textbooks too often as the end, instead of as the means of professional knowledge. The student versed in a few textbooks imagines himself equipped in the knowledge of his profession; not so in the first practical application to a building, he is compelled to confess that his reading only extended to general principles, and did not take into account certain contingencies of practice. Take any practical question, as the construction of a timber or iron roof of certain span and height, with dormers or skylights; the requirements for specifying the heating a building by hot water or steam, the planning of a school or laboratory. How hopelessly his book knowledge misleads him in such questions as acoustics, the author of which takes care not to give any examples of how a hall or church should be constructed! Others lay down impossible schemes. How provoking it is to find a textbook on iron construction leaving one in the dark as to the connection of iron columns and girders, or gallery construction details! A score of instances of such might occur to any architect. On the contrary, the examination of any building in which these requirements have been fairly met, furnishes information of a sort no book can give. One thing a building affords is the structural *connection* of parts. While the treatise deals with design in its separate parts, perhaps plan, or construction, or detail—in the concrete building the eye and mind can grasp the connection of the several parts, the relation of plan to elevation and to detail. In this way buildings form the best school and discipline for the student of style. No illustrations can give so complete an idea of the characteristics and functions of detail. The architect can, by drawing and measuring a few of the best monuments of a given period, make himself master of types of plans and mouldings, and is able to put together the forms he has thus learned by heart; secondly, he can learn the adaptation of materials better than any amount of verbal description can teach. Treatises on materials consider their properties without reference to their use in the building, just as treatises on construction describe walls, frames of carpentry and floors as separate things. On the building the architect sees an organic structure in which every material and every piece of construction has its proper function adapted to their several purposes, and it is in this connection that its real educative value lies. The building is the only school of style and construction, whereas the illustrated treatise is more like a bare, disconnected collection, and serves much the same use as a technical museum. Both have their purpose in education; but it is necessary to reassert the proposition now more strongly than ever, that building knowledge can only be efficiently learned from buildings. Old as well as new edifices must be studied. In London there is a capital choice. We have Wren's churches and interiors, the works of Inigo Jones, Soane, Gibbs, Chambers, and Adam Brothers, to go no further back. In the executed works of all these masters we can learn a good deal, in planning, in internal arrangement, and architectural detail. In many of the Inns of Court, as we have been told, there is abundant to learn in details of woodwork alone, and not a little that is charming in plasterwork. These buildings may afford us all that is necessary to learn of the style of the 17th and 18th centuries. But we have also a valuable catena of modern buildings in our town-halls and municipal offices in the leading revived styles. They surely can teach us more than a whole host of books on many things if we study them both inside and out, as a biologist does animal life, or the conchologist and botanist do the forms and peculiarities of shells and plants. Books are useful in the study of the classification of these things; but no observant student of biology or any branch of natural history would think of stopping here. Architects alone, of all professional students and scientists, are satisfied to take other authors' impressions for their own, to accept second-hand dicta and conclusions drawn up by partisans of this or that style, or this or that arrangement, and to build up their professional knowledge on the precepts of authors instead of upon their own observation and study of concrete facts, such as may be found embodied in ecclesiastical, in domestic, and secular buildings, in houses, hotels, schools, commercial offices, hospitals, libraries, museums, and a host of other works by modern architects.

INSTITUTE OF PAINTERS IN OIL COLOURS.

THE Institute in Piccadilly has a very fair sprinkling of clever pictures of the anecdotal, *genre*, and landscape orders, and it is something to find that the directors or council of the Institute have at length given up their scruples about admitting works of the "Impressionists," and that a small corner of the East Gallery has been timidly appropriated to the school which finds its freer expression at the New English Art Club. To this class of work we shall refer, after a rapid glance at the pictures in the West and Central Galleries. In the West Gallery a few pictures of more than ordinary merit are seen. In landscape, J. L. Pickering has one of his solidly-painted landscapes full of light, "Weybourne Pool, Norfolk" (19), conscientiously painted and in good colour, qualities not always obtainable. Frank Brangwyn contributes one important work after his manner, "A Trade on the Beach," perhaps a scene from Morocco, in which are seen a group of negroes of the African type squatting down and bargaining. Flat and mosaic-like in treatment, there is a lack of modelling, life, and movement in the figures; but the painter has the courage of his conviction at least, and his mode of representing sunlight and colour is the main incentive of this school of painters. The very sombre canvas by this master in the Central Gallery (376), called "A Sketch," a woman feeding ducks in a pond, is more a study of deep shadow, and as a colour experiment is of interest only to a very few. Ernest Parton is as delightfully delicate in his subject and manner as ever. "Windermere from the Fields" (157) hangs in a centre position. The thin foliage of the beeches is graceful; the wild flowers in the foreground brightened by scarlet poppies are exquisitely painted, and the misty distance of the lake lends a charm to the scene. J. Clayton Adams's "Golden Rocks and Silver Willows" hangs at the opposite end of room, another exquisitely-painted landscape, but perhaps just wanting in those qualities of strength of colour and force of handling which have given rise to the more vigorous expositions of nature. There is a softness in the picture which finds many admirers in this gallery. In a more masculine mood is E. M. Wimperis's "Carting Gravel" (95), a broadly-painted common, breezy and fresh; James S. Hill's "On the Stour" (168), a grey, broad effect of river and meadows; and Arthur Severn's "Cloud Effect near the Lizard" (175). Other pictures of merit are by Hamilton Macallum, as in his "Landing Fish," fresh in colour; John Fulleylove's "Ely Cathedral from the Marshes" (28), Frank Walton's "Old Barns" (29), Joseph Knight's "Stubble Field" (13), R. Thorne Waite's "Hayfield," &c. T. B. Kennington has a clever lamplight study of a girl, "Pierette" (39). Some nice colour is seen in G. Sheridan Knowles's little girl in blue frock carrying hay (48). C. Burton Barber has in a centre position a taking picture of a fair-haired little girl in bed, about to partake of her breakfast, with her dog and kitten beside her and a box of flowers—"For What We are about to Receive" (57); the composition and colour are pleasing. Leslie Thomson's river scene (105) is a study of light and colour, broad and Impressionistic. Of figure subjects, we must note Edgar Bundy's "A Love Philtre" (108) as one of the best. The subject represents an old alchemist in a gloomy cell illuminated by the fire of a retort, and having before and round him all kinds of apparatus, alembics, and flasks. The old man holds a phial of love potion before a dark young maiden who stands in front of the table. She looks somewhat terrified and motionless. The figures and accessories are boldly and cleverly painted. J. C. Nettleship's "Scenting" is a fine leopard study, and S. E. Waller's "Cotswold Kennels" (181) is of interest.

In the Central Gallery, the President, Sir James Linton, has in the usual position a small half-length figure-study of a buxom maiden, entitled "Autumn," the note symbolising which season may be found in the rich rose-coloured low-cut dress. She holds a plaited basket of grapes, and her dark hair and face is set off against a sky-blue. There is much skilful painting in the texture and sheen on the dress, but the work is less satisfying than others we have seen here. J. C. Dollman (200), "Her Father," has one of his clever, humorous pieces, which appeals at once to our sense of drollery. In the dress of the 18th century, a well-got-up beau has alighted from his horse at the garden entrance of a country house; he holds a beautiful bouquet in his hand, while at the half-closed gates stands the old gentleman in spectacles, surprised and repellent in his manner, who refuses to take in the proffered nosegay to his daughter. The drawing and composition are admirable. G. G. Kilburne's young lady going to a ball, in satin before a mirror, about to have her cloak put on, "Ready for the Fray" (195); Alfred East's clever little study, "Hoar Frost," Vincent P. Yglesias's "At Gorleston" (210), C. MacIver Grierson's "The Merry Thought"—two young girls pulling at the "merry thought" at luncheon (222), Arthur J. Elsley's group of merry fisher-children, "Here's Father!" are all works of merit. A felicitous piece of imagination illustrating "Gabriel Grub," from Dickens's "Pickwick Papers"—the graveyard scene in moonlight—by Edgar Bundy, shows invention and cleverness. H. Caffieri's "Gone" (231), a mother and child on a rocky ledge of a sandy beach, is sympathetic in its rendering; near it G. Reginald Frampton has a broadly painted river scenery, "Rye, Sussex," in which the light of sunset is well done. Stanhope A. Forbes sends a charming study of roadside, "Paul Church Tower" (258), a country lane in which a man and horse and some cattle are coming, painted with masterly effect; the perspective and colour and the drawing of the cattle are inimitable. John R. Reid, who sends three characteristic specimens of his work, is strong in colour and grouping in "Hush-a-Bye Baby" (297); the deep-blue sea gives light and warmth to the figures. J. J. Shannon's clever and somewhat decorative composition, "The Purple Stocking"—a young girl knitting, her head seen against a brass plaque, which, nimbus-like, reflects the light—is quaint and symbolical in motive; a charming colour study, in which the blue plates on the wall make a pleasant harmony. This is one of the cleverest subject-pictures. "Orpheus and Eurydice," by T. Graham, a typical pair of lovers, the young man playing a concertina to his smiling 'Arriet, strolling along the Victoria Embankment in the evening gloom. The lamps on the river glimmer, and throw a charm of seclusiveness over the pathway of the amorous twain. Frank Walton has a fine landscape (344)—a wide heath, with its yellow gorse. Robert W. Allan (311) paints "A Fisherman's Haven" as only he can paint it, solid, fresh, and full of sparkle. We see also some capital work by Alfred Praga, "Sorrow and Sin" (261), a girl bending over her desk, sunbeams entering through a curtained window. Adrian Stokes's "River Bank" is rather too cold in colour; George Wetherbee's "Summer Sea" represents an undraped maiden of nymph-like grace standing near a rock; E. C. Clifford's clever figure of a student, "In Grub Street"; John R. Reid's "The Woman's Work," a bright and freshly-painted subject (293); S. Melton Fisher's "Spring," a nice study of pink almond blossom and peasant girl, an Italian scene, and G. J. Linton's cottage and garden scene, "An Autumn Day" (333) are worth attention. The latter is somewhat hard, a fault that appears in his otherwise good picture in the East Gallery (509). Among the small studies is Tom Noyes Lewis's feelingly-painted "Vigil until Dawn," a kneeling recluse before an altar, rich in colour. Herbert Dollman has a cleverly-painted *genre* subject, "A Love Letter." A disconsolate young lover is seated at desk puzzling his brain over a letter. Torn scraps of letters litter the floor, and an elderly gentleman, possibly the father, near the door watches in silent wonderment the distracted state of his youthful son. St. George Hare paints a child with toys with true sympathy and subtlety of colour, and we see a strong work by Flora M. Reid (379), one of those sparkling fresh Normandy market pieces she loves to paint, and a fine sunlit cornfield by Anderson Hague, "Harvesting" (381), vigorously painted. G. Sherwood Hunter's "Alight" (278), is a characteristic figure, replete with life and colour, a reminiscence of Zuider Zee, a sturdy Dutch fisher lad smoking a huge cigar. John A. Lomax's "Trapped" (384), is a piece of historical drama, painted many times, but which does not lose its interest, an episode of the Cromwellian epoch, which is told well and minutely. There is much life and animation in the figure of the young cavalier bound by ropes to an iron chest, and in the other figures at the table. In the East Gallery there are few pictures that need detain us. The last painter's *genre* picture (391), an invalid young lady in the convalescent stage, seated in an armchair, her lover beside her, who has picked a number of red roses, is painted with much delicacy and colour. The "Dragon and St. George," by Rowland Holyoake, is quite Dollman-like in motive, a clever bit of satirical humour, a screaming comedy simply told. "Allurement," by Edward H. Fahey, is rather overdone. The young lady's rich rose-coloured velvet dress is well painted, and also the playing cat, but the accessories are distracting. Passing a few mediocre works, we come to Geo. C. Haite's "Sunday Morning," a delightful piece of satire on 18th-century church-going—an elderly lady, finely dressed, her pageboy carrying her prayer-book and scent-bottle behind her. Several Impressionist pictures are here hung, startling to the admirers of old conventions. A. Harrison's three pictures represent effects of sunrise and sunset and moonrise. "A Yellow Harmony" (429), "Moonrise," and "Eastern Glow" (434) are intended to represent the effect on the retina of certain impressions of light. The first may be deemed certainly unnatural, but it is experimental. These and "A Nautilus Race" (427), "The Entr'acte" (425), will no doubt be thought audacious attempts, but they each have a meaning and a presentment of truth. T. B. Kennington's "Hush!" (465) is admirable in drawing and colour, and occupies a prominent place on the walls, and on the opposite wall Miss Henrietta Rae's "Pandora" will be admired for the delicacy and grace of the figure and the refined colour. John R. Reid's "Ferryden Fisherfolk" is one of the largest and most important works of this master of fisherfolk and harbours, solidly painted and rich in colour.

Miss Amy Sawyer's "Lost Princess" (501), a legendary incident, shows strength and inventiveness. We have seen elsewhere Fred. G. Cotman's "Steaming into Lincoln," a very dexterous study of mist, smoke, and sunlight. Other pictures include J. L. Pickering's "Blakeney" (527), Carlton A. Smith's "Sweet Springtime," a graceful figure in steel-coloured satin standing beneath the blossoms of a tree (534); Claude Hayes' seascape (540); Anderson Hague's forcibly-painted "On the Conway" (543), beautiful in colour, and in the ripple of the river against a cloudy sky. Arthur Severn's "Sun Setting in Mist," a luminous Thames view with lady in flat punt (548), by Arthur Barrington; Robert W. Allan's "Through Wind and Rain," and a pathetic study of mother and child (575), by Miss May Baylis Barnard, are among the pictures that call for commendation. Sir Geo. Hare's "Bubbles" is a delightful picture of girls blowing bubbles, animated and painted in a luminous key; and John Scott's "Seven Ravens" (578), is a cleverly-depicted fairy tale—the ravens admirably painted.

THE ROYAL SOCIETY OF BRITISH ARTISTS.

THOUGH a smaller gathering of pictures than usual, the old gallery in Suffolk-street shows a higher average of work. This autumn two or three eminent honorary members have come forward to lend a helping hand—Sir Frederic Leighton, Sir E. Burne-Jones, Bart., and G. F. Watts, R.A. The President of the Royal Academy sends several delightful small "Studies for Pictures," such as the now historic subjects, "Fatidica," "Rizpah," "The Bracelet," "The Spirit of the Summit," "Summer Slumber" (5—10); also a group of landscape studies, which are hung on the screen (340—362), which are chiefly sketches in Greece and Italy. These studies are free transcripts of nature, fresh and suggestive of atmosphere. True classical feeling for breadth and spaciousness is to be found in these sketches of ruins, and plains, and promontories. Sir E. Burne-Jones's single contribution is one of those idealised, sweet, and seraphic faces which we are all acquainted with, full of spirituality and expression, and is to be found over the fireplace in the South-East Gallery. Mr. Watts sends two works. "Arion" (44), as a sketch for a larger work, is the most characteristic of this master. The Central Gallery contains, besides, a few pictures that may be regarded as compositions above ordinary merit. Robert Christie's large picture of "Idleness" (8) has unquestionable invention of a high order; the figure of the girl who is seated below a tree covered in blossom, with a Cupid behind her, listlessly blowing bubbles, which surround on all sides the figure, is gracefully drawn, and the colouring is in a low key. The work has a decorative value. F. Caley Robinson is a contributor of whose work there may be two estimates. His "Evening," in this gallery (14), a girl in a punt on a river, is flat and uninviting, though extremely suggestive of the pre-Raphaelite manner in its earlier days. His work in the South-West Gallery, "Mother and Child," will be intensely strange to the ordinary picture viewer; but is interesting to those who are watching the movement in art known as "Impressionism." The mother and child—the latter looks rather a girl in her teens—are seated together at a table, the former a fair-haired woman of the straight pre-Raphaelite type, with some embroidery before her, while the girl has before her toy animals, and is drinking from a cup. Both are quaint and slim in figure. In sentiment and pathos, this picture has much of the early pre-Raphaelite manner—too much to awaken more than popular curiosity, yet it has a certain charm of its own. A large corner picture (21), "Springtime on the Bay," by Fred. W. Jackson, shows some good painting in the foreground weeds and flowers and in the colour. The President (Wyke Bayliss) is, as usual, strongly represented. "St. Mark's, Venice" (24), is a noble interior, showing the screen and apse, rendered by a master's hand. The gleaming marbles and gold mosaics and frescoes are painted with much beauty of light and colour, from the President's own point of view. "Interior of the Duomo, Florence" (61), is another characteristic work, of equal interest, a poem of light, perspective, and colour.

We can only note the merits of J. S. Noble's tiger and monkey episode (26), Yeend King's "View on the Ouse" (29), Chas. E. Marshall's "Birthday Ode" (33), Adam E. Proctor's "Old Cronies," a pleasant study of village life; R. J. Gordon's "Bracelet," and W. Douglas Almond's three clever figure-studies near the fireplace, "Rejected," "Sunday Morning," and "Labour." H. A. Brownsword's "A Grey Evening, Wells-on-Sea" (46), a view of harbour, is in pleasant colour; and G. Sheridan Knowles has a figure-subject, "Adeline," a Tennysonian heroine, graceful and delicate in tone. Julius Olsson (78) has an ambitious rainbow and seascape, with sandy beach; Fred. Millard, a clean group of monks preparing their fishing tackle; G. Hillyard Swinstead's "Spellbound" is a large group of young ladies round an old-fashioned fireplace listening to a thrilling story by an old soldier, a skilful firelight effect (93); Stuart Lloyd's view of Christchurch is a melodious sunset. H. W. Strutt paints a facetious subject, two monks on a see-saw, with characteristic humour, "Religion never was designed to make our pleasures less" (95); R. J. Gordon's subject-picture is a strong piece of *genre*, representing two attractive young ladies seated at dessert, and a young man on the opposite side indulging in complimentary banter; the red background throws up the figures and white table-cloth with telling effect. A colossal canvas in the centre of the gallery, "Hope," by H. T. Schäfer (102), is allegorical in composition. "Hope," clad in white draperies, is poised in mid-air over a rocky coast, her arms outstretched towards a man on the rock below. The merits of the picture hardly call for so large a canvas. "Vanity Fair," by Fred. Roe, a scene from Thackeray, depicts, with much dramatic skill, the incident where Rawdon Crawley opens the door, to the surprise of his Becky, who is in full toilette on a sofa, the villainous Steyne having her hand in his, bending over her to kiss it when Rawdon enters. The colour and accessories of the room are pleasing. "Fame" is another large picture by W. Hunt (111), a misty and shadowy figure hovering over a group of despairing mortals below. W. Gilbert Foster's landscape, "O'er the Hills and Far Away," is effectively painted. W. Smith's "Great Thoughts" (120) is a clever bit of humour, but the dog could not possibly see the tempting dish on the table above him where he is. "The Magic Spindle," by Sydney Muschamp (81) is admirable in drawing and composition. In the other galleries we note the following: Arthur H. Buckland's "Le Crépuscule" (131). R. Machell's "The Path" is a large symbolical picture of sufficient power to command notice, both for its composition and colour and the design of the frame. A large grey-toned and impressionist picture is Rupert C. W. Bonney's "Nausicaa finding Odysseus," in which there is evidence of strength. "Half-way," by John A. Lomax, is a capital *genre* study (160); and A. W. Weedon's "Evening, West Highlands," a fine sunset effect on hills (168); "Rumswick, Yorkshire," by V. P. Yglesias; R. J. Gordon's "Windy Day," a figure of a girl in the wind; a fine seascape, fresh in colour, by F. Spenlove Spenlove (195); W. Manners's "Hayfield" (202); Robt. Morley's dog study, "Envy, Hatred, and Malice" (216); and Alfred W. Strutt's study of dogs, "Live and Let Live" (233) are interesting subjects. In the North-West and North-East Galleries the President's drawings of "Caudebec" (238), "Bayeux Cathedral" (250), and of "San Pietro, Perugia," are of much beauty. W. Harding Smith sends a capital drawing of "The Jesse Screen, Christchurch" (257), and another view of Canterbury, with glimpse of cathedral; Montague Smyth, studies of atmosphere and colour in North Holland (259), "A Wet Evening" (262); J. Herbert Snell, "Gipsies" (269). Over the fireplace, Dudley Hardy, F. Spenlove, E. W. Davis, and Edward Read show several vigorous sketches.

THE ARCHITECTURAL ASSOCIATION.

THE opening meeting of the present session of the Architectural Association was held on Friday evening. The President, Mr. Edward W. Mountford, F.R.I.B.A., who was cordially received on resuming the presidential chair, delivered the prizes in accordance with the following list:—Architectural Association medal, with prize of the value of ten guineas, G. Lucas; measured drawing prize, J. Allen; essay prize, value ten guineas and silver medal, subject, "The History and Development of Timber Roofs in England during the 15th and 16th centuries," C. de Gruchy; Cates Scholarship, tenable for two years, John Hunt; travelling studentship, bronze medal, C. C. Brewer; Oliver prize, T. F. Green. Lecture Side:—Division I.—S. L. Crosbie, silver medal; P. J. Groom, bronze medal. Division II.—S. Perkins, silver medal; T. E. Abbott, bronze medal. Division III.—C. de Gruchy, silver medal; J. R. Stark, bronze medal. Division IV.—J. P. Clark, silver medal; A. J. Stratton, bronze medal. Studio Side:—Division I.—P. J. Groom and H. W. Tomes, certificates. Division II.—T. F. Green, silver medal and certificate; H. C. Trimnell, bronze medal and certificate. Division III.—A. C. Dickie, silver medal and certificate; A. Wood, bronze medal and certificate. Division IV.—J. P. Clark, silver medal and certificate; M. G. Pechell, bronze medal and certificate. The medals were the long-promised ones, designed by Mr. Alfred Gilbert, R.A.

This ceremony over, the President delivered his

INAUGURAL ADDRESS,

in which, after thanking the members for his re-election, he expressed his satisfaction that the past session had been a most successful one—perhaps the most successful they had had under the present order of things. The studio and classes generally had been very well attended, excepting in Division IV., and the work done had been distinctly good. In a large majority of the classes the first man had gained more than the 80 per cent. of the maximum number of marks necessary to qualify him for a book prize in addition to his certificate, while in several cases he had obtained the full number allotted to the subject. This was very gratifying, as was also the fact that of the 96 new members who joined their ranks during last session, no less than 73 joined either the classes or studio, and that there were 78 students who took up complete courses of lectures and classes—40 of them being in Division I., 25 in Division II., and 10 in Division III. As regarded those who were really making use of the educational course, and who alone could obtain the full benefit of it, of the students who worked in Division I. in Session 1892-3, fourteen moved into Division II. in Session 1893-4, while seven moved from Division II. into Division III., and two from Division III. into Division IV. It had been his hope that more students would have seen the advantage of this gradual and sustained progress from one division to another; but this was an improvement upon last year, and he trusted the improvement might increase, for only so could the best results be obtained. The continued want of appreciation of Division IV. had been very fully considered and discussed by the committee, with the result that it had been temporarily abandoned, the subjects hitherto contained therein being either treated as extra subjects or room found for them in other divisions. It was proposed to re-establish it at the first opportunity. There was improvement also in the competition for prizes. Six designs were submitted for the A.A. Medal, while Mr. Brewer carried off the Travelling Studentship with a set of drawings of unusual merit; and although only one entered for the Essay Prize (Mr. de Gruchy), the sub-committee reported that his production was most meritorious, and well deserved the prize. The Architectural Union Co.'s prize was not awarded, neither was that offered by Mr. James Brooks. With reference to this last, the President suggested that the subject—one bay of the vaulting of the Cathedral at Oxford—was somewhat too difficult, necessitating, as it did, the use of scaffolding and ladders, as well as residence in Oxford. Mr. Brooks had, however, kindly allowed him to set the subject for the coming year, and intending competitors would find it not only interesting, but easily accessible with ordinary appliances, and within easy reach of London, so that a few summer Saturday afternoons would be sufficient for the work. One cause of complaint which he had to make last year the members had removed entirely—the attendances at the fortnightly ordinary meetings had been very good, and the discussions frequently quite animated. Having made reference to the losses sustained by the Association through the deaths of Mr. J. L. Robinson and Mr. Wyatt Papworth, the President continued: During last session the Association was actively employed in the consideration of the new Building Act for London. We entered an appearance against it before the Committee of the House of Commons, and made a determined effort to obtain the abolition of the clauses respecting parapets to party-walls so far as relates to dwelling-houses. In this work our past vice-president, Mr. Caröe, took a very active part, and spared neither time nor money to achieve our ends. He fully proved his contention that there is no necessity for carrying party-walls above the roofs of ordinary dwelling-houses, but with the present and late heads of the fire brigade against him we failed to carry the point. This is much to be regretted, for all of us, especially those who live in the suburbs, or daily traverse them in the train, must know how extremely unsightly they are in small houses and what constant sources of expense and damage to their interiors. Although we failed in this point, we were more successful in others, and we may at least congratulate ourselves that the new Act is a great improvement upon its predecessors, and removes many irritating restrictions under which architects suffered. Very much time and consideration have been given by both the committee and a special subcommittee to the scheme originated by Mr. Owen Fleming, for the better technical education of London workmen employed in the buildings trades. Our communications on the subject with the various City companies, the trades unions, and other bodies have received general approval, and with your consent a preliminary conference will shortly be held at which all the above-mentioned bodies will be represented. In my address last session, I advised very young architects to take any work that may chance to come their way, so long as it be honest and at all remunerative, whether it be "light and air" cases, "dilapidations," sanitary work, or any other lowly undertaking. As a fact, these things pay very much better than more pleasant and artistic work, as may be easily seen by comparing the incomes earned by the lordly surveyor with those made by the mere architect, and the palace inhabited by the former with the humble home of the latter. But now I want to remind the aforesaid young architect that, although the surveying work referred to is by no means to be despised, and is indeed very profitable, that it is only to be regarded by him as a means to an end, and that architecture not only *is* an art, but the greatest amongst arts. It happens that it is not what may be called a popular art, nor does it command the same remuneration from the British public that the arts of painting and sculpture do; but this, considered in the right light, may possibly be an advantage. The public does not run after architects and compete for the honour of employing them. It would never occur to the vast majority of them that architecture is an art. Very few, indeed, know a good building from a bad one, and they pay us our £5 per cent. commission equally willingly or unwillingly as the case may be, whether it be for designing a brick warehouse or a church full of elaborate detail. The very method of payment is obviously against our acknowledgment as artists by the public: they are more likely to class us with auctioneers, house agents, brokers, and other individuals paid by commission in a like manner. No, when the great British public speak of an artist they mean a painter, or possibly a photographer; but certainly someone who makes pictures that can be put in gold frames (made in Germany), and hung upon the wall. To them picture-making is art, and pictures appeal to them because they can, if the story told by the pictures be sufficiently clear, understand them, and then they buy them, and the manufacturers wax exceeding rich. But very few, comparatively, of the public care about or understand sculpture, and still fewer architecture, which is quite sufficient proof that of the three arts architecture is the greatest, sculpture the next, and painting last. But the public reverse the order, and pay accordingly. And so, as we are not likely to attain to either riches or glory by our work, it only remains for us to work for the sake of doing good work—work that shall be an honour to our time, and which shall be appreciated in the years to come. If you consider the work of an architect you will see how responsible it is, and how careful we ought to be to carry out to the very best of our ability all that is intrusted to us. Our work is necessarily conspicuous, and its influence, for good or evil, correspondingly greater than that of a picture or statue hidden away in some gallery or church. Statues and pictures must generally be the property and delight of the more or less rich; our work is for all, from the richest to the poorest. Doctors have this great advantage over architects, that when they make a mistake it is promptly buried, while ours remain a constant reproach possibly for centuries. Our own motto, "Design with Beauty, Build in Truth," fairly expresses the whole duty of an architect, and happy is he who can do it. The question of what constitutes the beautiful in architecture is more than difficult to answer. There is beauty of form, mass, and outline, beauty of colour and material, beauty of detail. Failure in any one of these mars the building, and but few men can hope to attain all. As regards beauty of outline, it would seem that a change is taking place in our ideas. Not so long ago picturesqueness was the great aim of most architects, and I well remember the mayoress of a considerable provincial town seriously informing me that a leading builder of the town (naturally an authority on the subject) had imparted to her the one way to make a building pretty, which was simply "to cut up the roof as much as possible and use plenty of iron cresting." This opinion was once no doubt more or less generally acted upon, but lately men have learnt once more that long unbroken lines and large masses of roof and wall impart a dignity and repose to buildings not to be obtained in any other way. Unnecessary breaks in the roof of a building are to be specially avoided, for they are expensive, constant sources of danger from rain and snow, and being meaningless, are certain to offend the educated eye. In the matter of colour one is the less likely to go wrong, probably, because the opportunities for doing so are more limited; moreover, in this respect time is good to us, excepting in very smoky towns. In London there can be no happier combination than red brick, Portland stone, and Westmoreland slates for the exterior of buildings, and, indeed, they would be fairly safe anywhere; but there are many other building stones of great beauty of colour, and tiles, shingles, and lead have good claims to consideration as beautiful roof coverings. Of the various beautiful colour effects to be obtained internally by the use of marbles, alabaster, and glass, it is impossible to speak here. I would simply say, avoid violent contrasts, do not dot slender shafts of dark marble about an otherwise almost white interior, as one not unfrequently sees done in modern churches, and make all the use you can of British materials. Probably a good many people are unaware of the wealth of red, green, and grey marbles to be obtained in our own islands. Beauty of detail is, perhaps the most difficult of all to obtain; certainly nothing more marks the distinction between good and bad architecture than the quality of its detail. The tendency of modern times has been to overload buildings with ornament of all kinds, many important buildings having been thereby spoiled. "When in doubt, turn on the carver" seems to be the principle on which many architects work, and no more fatal mistake can be made. Simplicity and breadth are the great things to strive after, and nothing more helps the appearance of a building than abundance of absolutely plain wall surface. What is more beautiful than the effect of sunlight upon a large mass of unbroken wall, where the ever-varying tints of good brick or stone have a chance of displaying themselves? Have carving by all means, but see that it is the best obtainable, and then probably the cost of it will prevent your having too much. Concentrate it, too, in masses, and do not spot it all about your elevations; then its richness gives value to the plain wall surfaces which by contrast add to the effect of the carving. It is a good plan when you think you have finished your elevations to go carefully over them again and see what features you can omit, and as you grow older you will probably find that more and more can with advantage be omitted. It is quite possible to design a noble building which shall be entirely free of any (so-called) ornament whatever, and owe the whole of its beauty to fine proportion and materials. So much, then, for designing with beauty. It is granted to but few men to be able to do it, but we can at least all try. A man who, really loving his work, sticks to it unflaggingly, always doing his best, and losing no chance of improvement, is sure in the end to produce work worthy of respect, even though he be not, and never can become, a genius. To "build in truth" is simpler, and, requiring but good common sense, is within the reach of us all. This part of our motto means simply that we should use each material in the proper and appropriate manner. It is not building in truth, for instance, when one designs what professes to be a half-timber building and executes the timber in cement, as a good many architects have done. This may be artful, but it is not art—in fact, it is merely a poor fraud, by no means justified by the fact that our London and many provincial building regulations bar the use of timber in this manner. A very pleasing front can be made of stucco, used as stucco, as Mr. Colcutt has shown us in Fleet-street. The use of cast iron to imitate wrought iron is another common fraud, and one that is quite unnecessary, because cast iron, used in the proper way, can be perfectly satisfactory and beautiful, as may constantly be seen in old work. Indeed, effects can be legitimately obtained with cast iron that it would be difficult, or at least extremely costly, to get in wrought. It only remains to consider how best a young man may learn to design with beauty, because this is the one great business of an architect. Well, first of all he has to decide whether he really is fitted to be an architect, and whether he had better not turn his attention to something else. It is extremely difficult to understand the reasons which actuate many young men in their selection of the calling of an architect. Some do it under the mistaken notion that it is a genteel profession—whatever that may mean. They will soon find out their mistake, and my advice to them is to become solicitors, and so acquire the advantage of being declared to be gentlemen by a special, and often necessary, Act of Parliament. Others join us because their fond parents discover in them a "taste for drawing." Unfortunately, that by itself is a very small qualification for the practice of architecture, although it is a most necessary thing to possess. Possibly he might do better by becoming a draughtsman for an illustrated paper, or even a mere painter. One of the funniest reasons for becoming an architect that ever came under my notice was that it was "a nice clean business." This reason was given by a young gentleman who favoured me with a call with a view of entering my office, and who at the time was acting as assistant to a hair-dresser. Thinking I was upon the point of bringing out a hitherto suppressed genius, I asked if he could draw pretty well, but was somewhat staggered by the reply, that he "did not know, for he had never tried." So I strongly persuaded him to give up the idea, which I have reason to believe he did, and this same advice I give to every young man unless he is quite sure of his heart being in the work. Unless it be, the whole thing must necessarily become the most dreadful drudgery, for probably no other profession requires so much right down hard work as ours, if there is to be any chance of ultimate success. A man possessed of a small income and influential friends may, indeed, obtain a large practice, and, with the help of clever assistants, carry it on successfully without having the least ability or love for the work; but though he may thus become a successful tradesman, he is certainly not an architect. Of course, however, the public will not realise that; so with plenty of assurance, some good luck, and a little entertaining, he may possibly in time become even an R.A. Supposing the imaginary young man to have made his decision, however, to have become articled in a fairly good office, to have been admitted to our Association, and to have joined our classes and studio. Then the one and only way to learn how to design is by the constant study of existing work. I say existing work advisedly, because it is my belief that the study of modern work is as necessary, and more useful, perhaps than that of old work. Of course, he must study old work—that goes without saying, but by all means study modern buildings as well. The old men undoubtedly acted upon this principle; they saw what had last been done, and then proceeded to make some improvement upon it, and if we work upon these lines architecture will become more and more living art. It is my very strong belief that there are amongst us now men capable of doing work better than any done here in the Middle Ages; indeed, I often doubt whether we should so much admire some of our famous old work if we could see it "white from the mason's hand." Take the west fronts of Salisbury and Wells Cathedrals, for instance, two of the most admired productions of the middle ages Worn by the hand of time, beaten by the winds washed by the rains and baked by the sun o centuries; saturated with religious sentiment and surrounded by the glamour of romance, they are most beautiful, and their contemplation fills one with delight. But if they could be done by modern architect, and stand before us brand new with all their mouldings clear and sharp, and their every detail as it left the mason's hands, do not hesitate to say they would receive very much unfavourable criticism from our shinin lights. Therefore, I repeat, study old work, bu do not fail to study new. There is something to be learned from it all, and though a great deal may be useful only in showing us what to avoid, there is much, very much, that is well worthy of our admiration. Take Mr. Norman Shaw's New Scotland-yard, for instance, and see how that fulfils every requirement as to simplicity, breadth, proportion, and colour. Look at the ecclesiastical work of Messrs. Gilbert Scott, Bentley, Bodley, and Pearson. Note especially how the latter obtains beautiful results, sometimes with scarcely any ornament and no sculpture. On the other hand, look at the works of Sedding, and see how full they are of charming detail. But whether studying old or really good new buildings, remember that you are not to think that by reproducing certain details of them you are doing the right thing. Quite the contrary. It is the spirit you have to strive after, the life that is in them, the evident enthusiasm and love for the work which they all show so plainly. These are not the buildings that tradesmen-architects produce. Nor is the £5 per cent. commission what their designers had in view when they produced them. That £5 per cent. is a curse of our calling, and probably does us more harm with the public than we realise. You must not trouble as to whether your work is going to pay financially or not; enthusiasm is what you want, fiery enthusiasm that will carry you through days and nights of arduous toil and through years of disappointment. Spare no time, nor thought, nor labour upon your work, and then, though you may never earn the wages of a commercial traveller, and have no chance of realising the fortune of a stockbroker, you will be repaid by the knowledge that you have done good work, work that may give pleasure to generations of your fellow men, when the stockbroker and all his ways are forgotten or only remembered with horror. Some very good men hold that an architect cannot do his best when trammelled by the conditions of a competition; but I venture to hold an opposite opinion, because, even if it be true in the first instance, the man who is so fortunate as to be successful in one of these affairs is certain to have plenty of opportunity and time for improving and maturing his design afterwards, and no one will object to his doing so. What I said as to the necessity of making it one condition of every competition that the author of each design should send with his drawings a formal declaration that the work is absolutely his own, has since received very strong confirmation. There have been two competitions during the year for municipal buildings in London, and in each case the successful design was entirely the work of ghosts. Now, for a man to send in, as his own design, the work of another, everyone must admit to be a downright fraud, and the man so acting ought to be punished by immediate disqualification. It is a matter that the Institute should take up strongly for the credit of the profession, as nothing can be more damaging to us as a body than the knowledge that this sort of thing is done. The ghosts themselves are by no means free from blame, but I am not prepared to sit in judgment upon them. They do their work honestly, for a more or less nominal sum; but their employers, who do not do the work, and could not do it, take all the credit and all the profit, to neither of which have they morally the least right; and, after all, if the design be a good one, as it may or may not be, it is certain to be more or less spoiled in the carrying out, by the utter inability of the reputed architects to properly detail it. In conclusion, the President said: I hope we are all agreed to work together, shoulder to shoulder, for the good of the Association. See that there be no petty jealousies among us, no envying, and no malice, but good, honest, healthy competition, as to who can do the most, not only for himself, but for the whole body, to raise the standard of work, and to maintain, unbroken, as handed down to us by our illustrious predecessors, the glorious traditions of the Architectural Association.

Mr. W. H. Seth-Smith proposed a vote of thanks to the President, which, having been seconded by Mr. Aston Webb, and supported by Mr. Leonard Stokes, was carried by acclamation.

THE SOCIETY OF ARCHITECTS.

THE tenth annual general meeting of the Society of Architects was held at St. James's Hall, Piccadilly on Tuesday evening, Mr. George Highton, F.R.I.B.A., of London and Bedford, the President in the chair. Mr. William Herbert Alton, of Sea-road, Bexhill-on-Sea, was elected as a member.

ELECTION OF OFFICERS AND COUNCIL.

The scrutineers reported that 78 voting papers had been received, two of which had been rejected as spoiled. The voting had resulted in the election of †Edwin J. Hamilton, of Brighton, as president; vice-presidents: †Ernest Day, J.P., F.R.I.B.A., Worcester; and Banister Fletcher,[§] J.P., F.R.I.B.A., London; honorary secretary, *Ellis Marsland, London; hon. corresponding secretary, †Major F. Seymour Leslie, R.E., War Office, Whitehall; treasurer, †H. G. Quartermain, Merton; hon. auditor, †S. C. Johns, Wallingford. Members of council (12): *G. A. T. Middleton, of London, 72 votes; Robert Keith, president, Dundee Institute of Architecture, 69; George Thomas, Cardiff, 69; Edgar Farman, London, 68; Henry Lovegrove, London, 65; Silvanus Trevail, Truro, 65; *C. A. Bassett Smith, London, 61; J. W. Frazer, A.R.I.B.A., Newcastle-on-Tyne, 61; *William Allport, F.S.I., London, 58; Herbert J. Jones, Bristol, 50; *W. A. Mallett, F.S.I., London, 49; and †Edward Tidman, F.S.I., 49. There were four unsuccessful candidates. (An asterisk denotes re-election, a dagger that the member previously held some other office.)

Mr. E. J. Hamilton proposed, and Major Seymour Leslie seconded, a vote of thanks to Mr. Highton, the retiring president, the first to hold office since the incorporation of the society, and who had carried out his duties with great ability, zeal, and tact. The President, in replying, expressed his desire to see the Society growingly prosperous and useful. He believed that the scheme of examination for membership to be brought before them would have an excellent effect on the Society. They had the prospect of a good series of papers to be read during the coming session. A vote of thanks to the retiring vice-presidents, Messrs. E. J. Hamilton and G. Baines, was agreed to on the motion of Mr. Edgar Farman and Mr. H. G. Quartermain, and was acknowledged by Mr. Hamilton. Mr. E. J. Kibblewhite proposed, and Mr. Sidney Marsland seconded, a vote of thanks to the retiring members of Council, for whom Mr. Allport responded, and a vote of thanks was also accorded to Mr. Ellis Marsland, the hon. secretary, on the motion of Messrs. Hamilton and Allport, and was suitably acknowledged.

THE MEMBERSHIP EXAMINATION QUESTION.

Mr. Ellis Marsland, in the unavoidable absence of Mr. G. A. T. Middleton, moved the adoption of the Report of the Council upon this question, as follows:—

> "The subject of the desirability or otherwise of an Examination of Candidates for Membership was referred to the Council at the General Annual Meeting held in October, 1893, and since then it has been under careful consideration. A Committee was appointed and drew up a series of questions, which were approved by the Council and submitted to the Members of the Society. The replies received have been considered, and the opinion of the Members appearing to be practically unanimous, the Council have decided as follows:—
>
> 1. That after October 31st, 1896, Election to Membership will only be open to Candidates who have passed the Society's Examination, with the following exceptions:
>   (*a*) Candidates who are not less than 35 years of age, and have been directly engaged professionally in architectural pursuits, as Principals, for at least seven years.
>   (*b*) Candidates who are not less than 35 years of age, and have been directly engaged professionally in architectural pursuits as Assistants for at least seven years.
>
> Candidates applying for Membership under *a* and *b* will be required, as heretofore, to submit drawings and other proofs of their professional abilities.
>
> 2. That the Scheme of Examination shall be formulated and published before June 30th, 1895.
> 3. That a Register of Students between the ages of 17 and 23 years be open on November 1st, 1894.
>
> Registered Students shall be pupils or assistants in Architects' offices and be nominated by a Member of the Society, subject to the approval of the Council.
>
> 4. Registered Students shall be entitled to the following privileges:—
>
> Free admission to lectures to be delivered under the direction of the Council in London and the Provinces; a ticket giving admission to the Society's Ordinary Meetings and the use of the Society's Library for reference; and a copy of each issue of the *Journal*.
>
> 5. That each Registered Student shall be required to pay 5s. per annum, on November 1st, in each year, and shall cease to be a Registered Student on October 31st next, after his attaining the age of 23 years.

In proposing its adoption, Mr. Marsland remarked that this was a very important step for the Society to take. He wished to see the Society a progressive one, and that could only be done by adopting progressive measures as the one under consideration. They did not propose to institute progressive examinations; but they wanted to be able to say that all elected as members were fully qualified architects. To the rule of examination before admitting to membership, it would be seen that two important exceptions were made—candidates over 35 years of age, and who had been in practice as principals for seven years, or as assistants for ten years, would be exempt, for it was felt that those who fulfilled either of these conditions would be loth to submit to examination, and probably too busy to undergo it. It had been objected that the examination was in opposition to, or rivalry with, the Institute; but he denied that this was the case, for they proposed only to establish a qualifying examination for their own members.

Mr. H. G. Quartermain seconded the adoption of the report.

Mr. Edgar Farman asked what were the numbers of replies to the circulars sent out asking the opinions of members on the scheme, and the proportion of votes.

Mr. A. Montefiore, the secretary, said about sixty circulars were returned, and of these 90 per cent. were in favour of the scheme. The report had been unanimously adopted by the Council.

Mr. A. Stoner protested that the Council was by no means unanimous; the report was adopted *nem. con.*, because the minority, rather than divide the Council, abstained from voting when it was finally carried. The opposition had been very strong.

The President said that the council minutes recorded that the report was unanimously adopted.

Mr. J. Hicks, of Redruth, as one who had passed many examinations in earlier life, thoroughly believed in the value of the system as a training. He should like to know what would be the nature of the examinations proposed, and whether acquaintance with the dead or with modern languages would be regarded as one of the tests.

Mr. Henry Lovegrove had considerable experience in the establishment of examinations in other bodies, as a member of an examination committee, as moderator, and as lecturer. He wished them first to decide whether or no it was well to establish examinations, and then they could consider what form they should take. The desirability of examinations was now agreed to; the first question was, Did the Society feel strong enough to close its gates against all but those passing an examination? If they believed they were, by all means let them institute a qualifying examination, and it was possible that they might, as the examining bodies of other professions did, accept certain examinations held by other bodies as evidence of qualification. It had always been thrown in the teeth of architects and surveyors that, unlike other professions, anybody could start in practice, and that there was no proof of their proficiency; and this argument was an injury to their status. He was glad to see that they proposed to exempt men of 35 years of age, both principals and assistants, from examination, as it was hardly fair to expect such men to submit themselves. He had been moderator at many examinations, and had found that men of 40 or 50 were not nearly so ready as younger men. Art writers told them that artistic faculties cannot be developed by examination; but he had never known a man of genius injured by education. Burns would not have written worse poetry, and might have avoided some mistakes, had he been as well trained as Tennyson, and while they could not insure that examination would produce an architect of refinement, they ought to ascertain that a man in practice possessed a minimum knowledge of constructional matters.

Mr. W. H. Seth-Smith, past president, expressed the continued interest he had in the welfare of the society; but he pointed out that they had consistently maintained that any examinations ought to be in the hands of the older and representative body, the Royal Institute of British Architects. In the past a great lack in that Institute was the absence of a compulsory examination to everyone entering that body. In draughting the Registration Bill the promoters had named the Institute as the sole examining body, and in so doing they had made a great concession and sacrifice to the R.I.B.A. He

felt bound to say a few words in opposition to the proposal for exempting those entering the Society. They had in the past urged that there should be one qualifying standard, as was the case in most professions. A notable exception was the medical, and the numerous schools were a great trouble to the General Medical Council, whereas they were asked to establish a fresh scheme. They had, further, always contended that the standard ought to be a very high one, and they all knew that the Institute was doing its best in this direction by establishing the new progressive examinations. Up to the present time the Institute had not been able to pay their examiners, and the services of the best men could hardly be expected without remuneration. He believed the Institute was alone equal to the task of examining, and therefore could not support the present proposal. He admitted the desirability of instituting such a scheme if the Society were numerically strong enough; but at present they had neither the numbers nor the means, unless candidates were prepared to pay heavy fees. He also doubted the expediency of the proposal, and knew that it would elicit a good deal of opposition which might, or might not, be good for them. He hoped that the council would not press the scheme, and would propose the following amendment:—"That this Society, in the interests of the profession generally, decides to postpone the institution of any examination, in the hope that the Royal Institute of British Architects will speedily promote legislation for the compulsory examination of all architects, and will secure for itself the privilege of being the sole examining body."

Mr. Stoner seconded the amendment, as he held that the Society was not numerically or financially strong enough to close the door at present.

Mr. Tidman pointed out that the institution of an examination for membership was unanimously decided upon at their last annual meeting.

Mr. Hamilton, as president-elect, feared he might be misunderstood in supporting the amendment; but he thought the scheme was premature, and if examinations were left with the Institute it would afford very long leverage for the Institute to support the compulsory registration of architects.

Mr. Hicks regarded the amendment as humiliating to the Society. It was delegating to another body of men work that they ought to undertake themselves.

Mr. Farman held that all men who called themselves architects should be compelled to pass an examination. Mr. Hicks's remark that the amendment was humiliating showed that he had not sufficiently studied the question. The Institute examination might not be their ideal, but it was most thorough and searching.

Mr. E. J. Kibblewhite reminded members that the report was based upon the unanimous resolution of the last annual meeting, and was brought forward as the unanimous recommendation of the council. Were they to eat their own words? Was the scheme now to be frustrated by the—prudence, he would term it, of some members? They were warned that the Society was not strong enough, and that they must wait; but it struck him, in the words of the Salvation Army hymn, that—

> If you tarry till you're better,
> You will never come at all.

His objection to the scheme was not that it went too far, but that it did not go far enough. He did not see why the middle-aged gentlemen of 35 years and upwards should be exempted from examinations when two years remained in which they could freely enter the Society.

Mr. Ellis Marsland, in replying on the discussion, said Mr. Seth-Smith's amendment had been supported for opposite reasons. All admitted that architects should pass some examination; but Mr. Seth-Smith held that there should be only one examining body, the Institute, which would allow of qualifying examinations. Messrs. Hamilton and Stoner feared the Society was not strong enough, but they must go forward or the Society would retrograde. He entirely disagreed with the Institute system of examinations as too prolonged and needlessly severe. He wished the Society to institute a practical and shorter examination, and one that will enable the public to know, not whether a man can speak French or German, but whether he has a thorough knowledge of his profession.

The President reminded the members that examination had been practically decided upon by the Society, and it was not proposed to commence the scheme for another two years. He thought they would be doing wrong if they did not provide some sort of qualifiying examination. He then put the amendment, which was lost, in a thinly-attended meeting, by a majority of three.

Mr. Farman then moved a further amendment —Clause 1: "That the following article be added as Article 11a to the Articles of Association, to become operative on October 31st, 1896: 'Subject to confirmation by general meeting, the council shall select from time to time certain examinations, which shall be deemed qualifying examinations for membership of the Society; and election to membership shall be only open to candidates, approved by the council, who have passed an examination held by the Society, or any one of such examinations, with the following exceptions: (*a*) Candidates who are not less than 35 years of age, and have been directly engaged professionally in architectural pursuits, as principals, for at least seven years. (*b*) Candidates who are not less than 35 years of age, and have been directly engaged professionally in architectural pursuits as assistants, or as assistants and principals for at least ten years.'" He held that they were not yet strong enough to establish a sole examination, and ought for the present to accept certain examinations already instituted as qualifying ones. The alteration to Clause B was, it will be seen, a neutral one, providing for the case of the man of 35 who had been assistant, and then principal during parts of the ten years which qualified for exemption. He would suggest that the council's propositions for registering students be postponed for the present.

Messrs. Hamilton and Hicks supported the amendment.

Mr. Kibblewhite said he distrusted it, as it was asking them to shunt that which could not be obstructed. The Society would, moreover, never be thoroughly successful till provision was made for the registration of students. He would like to be quite sure that the new council meant to go on with that part of the scheme.

The hour being late, the amendment was carried in a rapidly emptying room, by ten votes to three, and Mr. Farman withdrew his proposal to postpone clauses 3, 4, and 5, providing for the registration of students.

BANKS' FIREPROOF CONSTRUCTION.

We have so often heard of "fireproof" buildings being burnt to the ground that some have come to the conclusion that fireproof buildings do not exist, and are not likely to. Unfortunately *uninflammable* is not the same as *fireproof*, as the construction of many buildings in brick, iron, and concrete has too often proved. At the great fire last year in St. Mary Axe, warehouses built with wooden floors stood better than some of iron and concrete; the reason, of course, being that frequently when iron is exposed to heat, it expands irresistibly, crushes the concrete floor, and the whole falls bodily, or it pushes out the walls and makes still greater ruin.

A new system has lately been brought out, and on Friday last a party of some 100 architects and scientific men met at the St. Pancras Ironworks, Belleisle, to witness tests of a severe character applied to a house built on this plan. A small four-roomed house with doors, windows, chimney, &c., was built in brickwork on a piece of waste ground adjoining the works at Belleisle, York-

road, the upper story being covered with a wood-joisted ceiling, and the roof made of wood and corrugated iron. The floors of the upper story and the partition walls were made on the system patented by Mr. T. L. Banks, F.R.I.B.A., and the ground floor was filled with shavings and pitchpine, saturated with petroleum. This was set fire to, and allowed to play on the ceiling for about three-quarters of an hour. The fire was then extinguished, and when the interior had cooled sufficiently to be explored, the floor above the fire was found perfectly unharmed, and the ceiling and walls intact. There was no sign of falling plaster, and in the story above the apartments were cool, and a block of ice that had been placed there before the fire was lit, was unmelted.

We should like to have seen as well a vertical test of the system applied, say, to a staircase, or partition wall; but have no reason to doubt that the result would have been equally as satisfactory. The principle claimed for this system of fireproof is the interposition of a fire-checking obstacle virtually severed from, and not in direct connection with, that part of the structure to be protected. In the case of fireproof floors a suspended ceiling is the fire-checking obstacle. Between the ceiling and the floor above is a perfectly open and undivided chamber, through which an uninterrupted current of air passes. This current of air, it is claimed, provides much better protection from heat than covering the parts to be protected with any non-heat-conducting substance. It is also held to be of the first importance that the constructive iron or wood should not be in contact with any substance reached by the flame, such as tiles and plaster. The exhibits at Belleisle last Friday consisted of three fire-resisting floors, two being ventilated and one solid; a fire-resisting partition, a mode of protecting wood construction from fire, helical twisted metal lathing, and a fire and waterproof plaster. The first ventilated floor is constructed as follows:—Light iron arched centres, in lengths which can vary from 4ft. to 8ft., rest upon the lower flanges of the steel joists. They are spaced from 12in. to 15in. apart, and are covered with sheet or corrugated iron to support the concrete. Horizontal bars of iron are suspended from the ends of the centres, and are upheld throughout their length by additional suspenders from the arch bar. These latter suspenders are not bolted as those at the ends, but can be moved along the arch towards its centre, so that in the event of the weight of the concrete slightly deflecting the arch bar, the horizontal or ceiling bar can be adjusted to a true level. The level of these ceiling bars is never less than 3in. below the lower flange of the steel joist. Experiments, we are assured, have shown that small pieces of wood and shavings resting on the ceiling will ignite when the ceiling becomes sufficiently heated, but that removed 3in. away they will not do so. It follows, therefore, that the ceiling being suspended from arch bars which cannot be made red hot will remain level and unbroken, notwithstanding the heated state of the horizontal bars within the ceiling.

The lathing which supports the plaster is constructed of helically-twisted and woven flat wire. This metal lathing offers a perfect and uniform key. It is imbedded in the plaster, and, unlike punched sheets, is not *exposed in one surface* and liable to expand when heated. The plaster is a composition which is worked easily, and sets as hard as Portland cement. It does not corrode, but preserves the iron. This plaster not only withstands fire, but the effects of water played on it when white hot. Samples shown thus tested excited a good deal of interest

Ventilated floor No. 2 differs from No. 1 only in the substitution of removable centres which can be reused, which is a cheaper form of floor when there is much repetition of the same sizes.

The solid floor is distinguished from other solid floors by providing a centring in the metal lathing, which also secures a good key for the plaster ceiling, and by its binding together all the steel joists with straining rods. Should the floor become heated and the joists expanded by the heat, the metal lathing centring which upheld the concrete in its liquid state will continue to do so, though the concrete be rent and cracked by reason of this expansion.

In large works now being carried out, advantage has been taken of this principle. The floors are constructed of very light steel joists bedded in concrete. The floor over each room is treated as one slab, not *divided* by steel joists, but strengthened and bound together by the joists, straining rods, and metal lathing.

Floors constructed of wood joists are therein protected by a similarly suspended ceiling. By sacrificing 3in. in the height of a room, existing buildings can have this fireproof ceiling added, without removing the existing ceiling.

The fireproof partition shown is constructed of light iron framing, covered on each side with metal lathing, and plastered. It is extremely light, and at the same time rigid. Solid partitions 2in. thick can also be built by means of this metal lathing. Columns, stanchions, and girders to be incased with metal lathing and the fireproof plaster have patent "distance pieces" applied, to separate the plaster casing from the iron.

DEAN SWIFT'S ESCRITOIRE, AND CABINETS FROM ROXBORO' CASTLE.

APART from its associations with the gifted and eccentric Dean Swift, the old Escritoire of which we give a drawing is a highly-interesting piece of furniture. It is made ef oak, inlaid with walnut, and decorated with marquetry. In the lower portion, the two-side pedestals are fitted with different size drawers, slightly concaved in the front, and finished with a circular head on the top drawer, each ornamented with small beading round. In the central recess is a cupboard with shelves. Underneath the fall-down flap, which, together with the lift-up flap, at the top of this lower portion, incloses the escritoire proper, is a writing-table, which slides out. The inclosed portion is fitted with beautifully-made drawers and pigeon-holes, with a small central cupboard, with a niche-like shaping in the door, and curved pediment over; while right and left the two central pigeon-holes are likewise surmounted with curved pediments hollowed out. The upper body has the ordinary cupboard arrangement, with shelves shaped on the edges, and inclosed by two doors with fluted pilasters of sycamore on the stiles, with flat Corinthian caps. Between these pilasters, of which there are two on each door, is a bevelled mirror, with shaped head. Besides the general drawing with the escritoire thrown open, we give a small sketch showing the flaps closed, and the writing-slide drawn out, and revealing additional drawers immediately below the top cupboard. We may say that, though no absolute proof exists of this escritoire having belonged to Dean Swift, there are strong grounds for sustaining the traditional reputation it bears, and which its present owners, Messrs. M'Coy and Sons, of Belfast, will doubtless do all they can to establish. The two Cabinets which are shown on the same drawing were purchased at the sale of Lord Charlemont's effects at Roxboro' Castle, Moy, Co. Tyrone. They are unusually fine, and in splendid preservation. The Elizabethan one is in oak richly carved, and fitted with the usual top and bottom cupboard, separated by a long drawer. The other one, probably of earlier date, and certainly of more unusual form, is made of chestnut wood, and the carving seems to point to Irish workmanship. It is singular, too—in that there is no projection or break to separate the two cupboards, as in the other and most cases. We are indebted to Messrs. W. J. M'Coy and Sons, of Belfast, in whose possession these fine pieces of furniture are, for their courtesy in enabling us to illustrate them.

THE L.C.C. AS THEIR OWN CONTRACTORS.

AT Tuesday's meeting of the London County Council, the Works Committee presented accounts showing the differences between the estimated and the actual cost of works intrusted to them. The total estimates amounted to £66,061 19s. 2d., while the actual cost was £63,045 18s. 5d. They claimed that in such works as excavation and brickwork, the cost compared very favourably with that of contractors, but in architectural work, where the cost had exceeded the estimate, their work was of such a quality as is only comparable with that executed by builders of the highest class, who very seldom undertake work at competitive prices. They considered they had had to work under difficulties, such as unsuitable premises, second-hand machinery worked by old and wasteful engines, and so on, and these conditions will have to continue until nine or twelve months hence, when the new workshops, stables, and offices will be completed. In the discussion which followed, Mr. Westacott pointed out that in the report there were 13 items mentioned, of which nine cost more than the estimate and four less. The only work they could manage to do under the estimate was that done underground, where it could not be seen. Nearly every matter referred to the committee cost more than the original estimate, and they were by no means saving the ratepayers' money. Mr. Hoare said that the committee had not been in existence a sufficient length of time for the Council to ascertain the profit or loss arising from their operations. He suggested that the Council might later on obtain powers to compete with contractors for the work of local authorities. Lord Farrer agreed with Mr. Hoare that it was too early yet to say whether the Works Committee was a success or not. He hoped they would take into consideration the suggestion that they should offer to do work, especially sewer work, of which they had large experience, for vestries and other London authorities in competition with contractors. The debate was adjourned.

BEARING POWER OF FOUNDATIONS.

THE following data have been published in a recent textbook by Mr. E. L. Corthell, of the Western Society of Engineers, on the relative bearing power of foundations. In clay soils the resistance is from 2 to 8 or 9 tons per square foot, with allowance for friction. In sand the data vary much in different kinds. Sand mixed with loam will not bear more than 5 tons per square foot. Nine and a-third tons per square foot were placed on fine gravel and sand at Urk Viaduct; masonry piers on cylinders 4·8in. diameter; friction neglected. In India, on coarse sand, not over 9 tons are used. In experiments 20 tons have been placed on sand without settlement. Referring to friction, the author says: Side friction varies from 200lb. to 600lb. per square foot. Blackfriars Bridge, on clay, is put at 5 tons per square foot, settled; new London Bridge 5 tons per foot on piles = 80 tons per pile, settled badly. Other weights are given of American buildings. Thus, Washington Monument is 9 tons per square foot, inside edge; clay and sand 3 tons per square foot, outside edge. These data vary greatly, arising from the admixture of loam or gravel with the sand; the latter appears to give the highest results.

CHIPS.

The work of excavating the tumulus in Parliament Hill-fields, Highgate, was begun on Monday by a body of workmen in the employ of the London County Council. This tumulus is supposed to be the burial-place of either Queen Boadicea herself or of a number of her followers. The work of excavation and investigation is being carried out under the supervision of Mr. C. H. Read, of the British Museum. The mound has been carefully fenced in since the County Council became the guardians of the fields, and during the progress of the work of excavation it will be carefully guarded night and day.

At the eighth annual meeting of the Egypt Exploration Fund, held on Monday, the chairman, Sir John Fowler, stated that there was now little danger of the destruction of the temples of Philæ; further inquiries had shown that the material necessities of Egypt and the claims of archæology were capable of reconciliation.

The London County Council approved on Tuesday a recommendation of the Parks Committee for certain expenditure with the object of providing a new entrance to Brockwell Park from Arlington-road, Brixton. It was also agreed to contribute £7,500 towards the completion of Bishop's Park, Fulham. On the recommendation of the Water Committee, an expenditure of £450 for the surveying of certain large reservoirs in connection with a water-supply scheme now being considered was approved. In reply to a question as to whether the scheme was in regard to a direct supply from Wales, Mr. Bassett Hopkins said it would not be consistent with public interests to give any information at present.

In mentioning, on p. 559 in our issue of Oct. 19th, the new board schools in course of erection in Church-road and on Roman Hill, Lowestoft, the address of the builder of both groups of schools, Mr. G. E. Hawes, should have been given as of the Steam Joinery Works, Duke's Palace, Norwich.

The statue of Edward Colston, the Bristol philanthropist, about to be erected in that city, will be executed by Mr. John Cassidy, of Manchester, and is 8ft. in height, being executed in bronze. The pedestal will be of stone, and 10ft. in height.

The Pope has given orders for the preparation of his own tomb, and Signor Maccagnani has received the commission to set about the work. The monument, which is to be of white Carrara marble, is to be a sarcophagus, on which will repose a lion with its four paws resting on the Papal Tiara. To the right there will be a statue of Faith, with a torch in one hand and the Scriptures in the other, and to the left a figure of Truth, the hand laid on the coat of arms of the Pecci family. The Pope directs that his remains be buried in the Basilica of St. John Lateran.

COMPETITIONS

EDINBURGH.—At a meeting of the directors of the North British Railway Company, held on Friday, it was resolved to invite plans for the new North British Railway Hotel, Princes-street, Edinburgh, from a selected number of Edinburgh and Glasgow architects.

KILKENNY.—The corporation held, last week, a special meeting, for the purpose of considering plans sent in by architects for the erection of a new town hall. Seventeen designs were received, from among which an assessor had selected three, recommending one for adoption. This did not, for some reason, meet with the approval of the majority of the members, and a long discussion took place as to whether the assessor should re-examine the designs, or whether they should be dealt with by the members in committee. Several members objected to the further charge of five guineas which the assessor would require, and accordingly the corporation decided to act as their own adjudicators. The stipulated cost of the town hall is £4,000. We are no prophets; but we venture to predict that under this exposition of the practical working of Home Rule a local architect will be selected. We believe that a few months since the same corporation advertised for competitive schemes for a water supply for Kilkenny, and stated that an assessor would be appointed. The assessor placed the design of a Belfast engineer first; but in their wisdom the commissioners set aside the award, and adopted the design of a local gentleman.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.—The 20th session of this association was opened on Friday night last by a conversazione, exhibition of drawings, and smoking concert, held at the rooms of the association in the Exchange. Mr. W. Henman, the president, was in the chair, and was supported by Messrs. Reading, Peacock, McConnal, Hawley Lloyd, Harrison, H. R. Lloyd, Newton, Hale Silk, Bewlay, &c., and Messrs. Bateman and Buckland, hon. secs. An interesting and representative collection of drawings had been provided, the chief exhibitors being Sir A. W. Blomfield, Messrs. George and Peto, Douglas and Fordham, Maurice B. Adams, G. Horsley, R. N. Prentice, Ernest Newton, R. A. Briggs, James Brooks and Son, Arthur Bolton, A. Cox, Bateman and Batemen, Cossins and Peacock, A. Harrison, Ernest C. Bewlay, J. A. Swan, &c. A few water-colour drawings and landscapes were also lent by H. Wilson, R. Phené Spiers, A. Harrison, Victor Scruton, Ernest C. Bewlay, &c. In the vocal part of the evening the members were assisted by Messrs. Crosbee, T. Mathews, Pritchard, Hughes, &c.

CARLISLE ARCHITECTURAL, ENGINEERING, AND SURVEYING ASSOCIATION.—The annual general meeting of this association was held in the Town-hall on Wednesday, Oct. 24th. The business consisted of the election of various officers, Mr. C. Lonsdale being elected president, Mr. P. F. Ruthven and Mr. F. J. Nichols vice-presidents. A letter of resignation was read from the late hon. sec., Mr. J. Rush Dixon, now residing in Walsall, and it was resolved that the best thanks of the association be awarded to Mr. Dixon for his former able services. Mr. Edwin B. Newton, city surveyor's office, was appointed hon. sec. and treasurer. The annual balance-sheet was read, showing that financially the association is in a most flourishing condition. The opening meeting of the session 1894-5 will be held in the Town-hall, at 8 p.m., on Wednesday next, when the president will read the opening address.

Major-General Crozier, Local Government Board inspector, held an inquiry at the Council-chamber, Haslingden, on Thursday in last week, with reference to the application of the corporation to borrow £19,000 for cemetery and town's yard purposes, and £3,300 for a town-hall.

High-street Congregational church, Burton-on-Trent, was reopened last week after renovation and alterations. The alterations include the removal of the old pews and the erection of more modern seats, the lowering of the general gallery, and the enlargement of the choir gallery. Messrs. Lowe and Sons and Mr. Turner have carried out the general work, while the decoration has been in the hands of Mr. Coulson, of Birmingham. The work was executed from designs by Mr. Carpenter, architect, of Burton.

TERRACOTTA MEDALLIONS, BY GEORGE TINWORTH, OF MR. J. PASSMORE EDWARDS AND THE LATE WILLIAM BLADES, FOR THE ST. BRIDE FOUNDATION INSTITUTE—THE NEW SWEDISH HOUSES OF PARLIAMENT AND NATIONAL BANK.—THE JOURNEY OF THE MAGI.—XXXVI. AND XXXVII. HIGHLAND GARDENS, ST. LEONARD'S; ST. BARNABAS' SCHOOLS, BEXHILL-ON-SEA; HOUSE IN BOSCOBEL ROAD, ST. LEONARD'S-ON-SEA.—DEAN SWIFT'S ESCRITOIRE, AND CABINETS FROM ROXBORO' CASTLE.—COUNTY BOROUGH OF SALFORD MODEL LODGING-HOUSE.

Our Illustrations.

TWO MEDALLIONS FROM THE ST. BRIDE FOUNDATION INSTITUTE.

Nearly twelve months since the foundation stone of the new St. Bride Foundation Institute was laid by the Prince of Wales, and in our issue of Nov. 17, 1893, we gave a double-page illustration of the building, which is being erected, from the designs of Mr. R. C. Murray, by Messrs. W. Brass and Sons. We mentioned at the time that Mr. J. Passmore Edwards had placed at the disposal of the governing body of the Institute a sum of money sufficient to purchase a modern technical library of works on printing and the allied trades, and that the collection of books and pamphlets on printing of the late William Blades, an eminent London master printer, had also been secured. The donors of the "Passmore Edwards Library" and the "William Blades Library" are to be commemorated by the erection within the building of the two Medallions we illustrate this week. They have been modelled by George Tinworth, and executed by Messrs. Doulton and Co., and are remarkably good likenesses, and more than average examples of their distinguished sculptor's ability. The late Mr. William Blades was doubtless highly esteemed by many readers. Mr. J. Passmore Edwards is as much so by all who know the Building News, which his energy and enterprise years ago made the foremost journal of its class, and most of the readers of which have reasonable cause to witness with satisfaction the bent and scope of his discriminating liberality, which, in the erection of many public libraries, hospitals, and other public buildings, has provided many thousands of pounds' worth of work for all connected with the building trades.

THE NEW SWEDISH HOUSES OF PARLIAMENT AND THE NATIONAL BANK OF SWEDEN.

For more than fifteen years past the question of a new parliamentary building worthy of the nation has been before the Swedish Parliament, but not until the year 1888 the indefatigable advocate of the scheme, Herr E. Lithander, member of the Upper House for the great city of Gothenburg, and to whose courtesy we are indebted for the drawings and plans, with description, published in the present issue of the Building News, succeeded in carrying a motion whereby a committee was appointed to invite and consider designs and plans for the new buildings, conjointly with similar ones for the National Bank of Sweden, to be located on the same premises. King Oscar has always taken a warm interest in the scheme, and supported it substantially, as we shall presently show. The committee appointed framed a programme for the erection of the buildings on the so-called Helgeandsholme, an island situated in the river which flows through Stockholm in the most central and public part of the capital facing the square of Gustavus Dolphus, and at an angle with the Royal Palace, the Prince's Palace, &c. The competition was naturally confined to Swedish architects, and although four tempting prizes were offered, and, we believe, over a hundred excellent designs received, none met with the full approval of the jury, most of the plans submitted far exceeding in cost of execution the sum limited by the Riksdag—i.e., about £350,000. In consequence of this result the committee was empowered to request Herr Helgo Gettervall, one of its members, chief of the Crown Building Office, and a leading architect, to prepare the necessary designs and plans of the buildings, and it is these that we illustrate. The technical part of the description of the structures runs as follows:—The Houses of Parliament are approached by a sweeping raised terrace and a flight of broad steps, and entered through a huge portal which constitutes the central portion of the main elevation. This portal is supported by Ionic marble columns. The portico leads into a vestibule and hall of great width and dimensions, running through two stories, and lighted from above. From this hall stairs lead on both sides to the upper and lower stories, whilst on the level are the Parliamentary lobbies or foyers, with refreshment bars, &c. Facing the great arched entrance-way runs a vaulted gallery, whence access is gained to the common hall, the private rooms of the Presidents, the Cabinet Ministers, and other high officials. Access to these rooms is also easily gained from the members' lobbies. The principal entrances of the body of the two Houses are, of course, from the foyers, with side entrances from the gallery referred to, both Houses being thus conveniently connected. Each House has its separate system of refreshment, club-rooms, &c. At the back of the Tribunes there are separate entrances to the body of the House for the Cabinet Ministers, Presidents, and others, whilst below the public galleries in both Houses are two large boxes, reserved for distinguished visitors. The lighting of the two chambers is effected partly from the ceiling, and partly through huge windows looking on to the courtyards. In the wing abutting on the Drottninggata Passage are localised the Parliamentary offices, and these are reached from the vestibule by separate staircases, whilst others lead direct to the upper parts of the House, to the Presidents' rooms, the library, and the clubrooms. Close to the common hall is a staircase, which runs through all stories, lifts, &c.; but this part of the building is not accessible to the general public from the galleries. Five staircases lead to the top floor, where are situated committee-rooms and other offices. On this floor, too, are found, but distinctly separated, the public galleries of both Houses, the diplomatic and the press galleries. There are no separate galleries for ladies. The three galleries communicate, and to each are attached writing, telephone, and cloakrooms. On this floor are various exits available in case of fire. On the upper floor is situated the library, with offices attached to the same, and in this part a lift runs from the top to the bottom of the building. On the bottom floor, reached by many staircases, are the public bars and restaurants, with offices connected with the Parliamentary Treasury (members are paid in Sweden), and the telegraph and telephone services. The Bank of Sweden will be located on the opposite side, or at the back of the block described, this part forming a semicircle by the Vasa Bridge. Naturally the bank will be constructed with all modern improvements and means of safety, whilst in all parts of the twin building concrete and iron are to be employed for floors and walls, and the materials principally used in the general construction are granite, lime, and sandstone. The roof will be of iron, sheeted with copper. The undertaking is the vastest of its kind ever entered upon in Sweden, and it may be confidently stated that its entire execution and completion will entail an outlay of close upon £400,000. As stated, King Oscar has given a strong support to the undertaking by presenting the site, his private property, estimated to have a value of £50,000.

OLD MASTERS ON THE CONTINENT.—X.: "THE JOURNEY OF THE MAGI" (FLORENCE), BY BENOZZO GOZZOLI.

Mr. Charles Eastlake, the Keeper of the National Gallery, has already somewhat fully described the magnificent series of Benozzo Gozzoli's frescoes at Florence, when we gave the first of our reproductions from them in our issue for July 27th last, p. 98 *ante*. On August 24th we printed another compartment of the same cavalcade, with a further descriptive article written for us by Mr. Eastlake, p. 241 *ante*. To-day we are enabled to represent another of these paintings, in which the grand costume of the figures and intricate detail of the landscape are excellently shown. The reader will do well to refer to the above papers, which include a biography of the painter. Some of these figures are shown as typical examples of historic dress by the late William Burges, A.R.A., in his big folio of "Architectural Drawings," and they were also included in Lonsdale and Tarver's smaller volume on the "History of Costume." They were in these volumes only depicted in outline.

XXXVI. AND XXXVII. HIGHLAND GARDENS, ST. LEONARD'S-ON-SEA.

These houses occupy a good position with south aspect, and contain three reception, six bedrooms, &c. The work has been carried out by Mr. T. Salter, contractor; Mr. Philip Tree, F.R.I.B.A., being the architect.

ST. BARNABAS' SCHOOLS, BEXHILL.

This scheme, by Mr. Philip Tree, F.R.I.B.A., was one of the two placed designs for the above in open competition some little time ago. The scheme was afterwards abandoned, and a two-storied building erected.

RESIDENCE, BOSCOBEL-ROAD, ST. LEONARD'S-ON-SEA.

This residence contains three reception, seven bed and bath-rooms, &c., and is occupied by the Rev. R. Cowan. Mr. Charles Hughes was the builder, and the architect Mr. Philip Tree, St. Leonard's-on-Sea.

DEAN SWIFT'S ESCRITOIRE, AND CABINETS FROM ROXBORO' CASTLE.

(For description, see p. 604.)

MODEL LODGING-HOUSE, SALFORD.

In the Building News for Oct. 19 last, we gave a full description of this building, and we now supplement it by reproducing the ground and first-floor plans and section, showing more clearly the arrangement of the blocks. The whole of the work has been carried out from the plans, specifications, and quantities of Mr. Joseph Corbett, the borough engineer, and the building, which is situated in Bloom-street, was opened on the 13th of last month. The scheme is based upon the successful design of the London County Council competition for a model lodging-house; but though this general principle was adopted, departure has been made from it in many details and in several important points.

CHIPS.

A marble bust of the Marquis of Salisbury was unveiled on Tuesday in the Conservative Club at Edinburgh. It is life-size, and was executed by Mr. Birnie Rhind, sculptor, of Edinburgh. The head is bent, and the draping on the shoulders is simple. The bust is placed in the reading-room, on a carved oak pedestal, executed by Messrs. John Taylor and Son, harmonising with the woodwork of the room.

An organ, rebuilt by Messrs. Driver and Haigh, of Bradford, at a cost of £315, was opened on Friday in the United Free Methodist church at Cowling, near Colne.

The Devon Volunteer Memorial Committee have adopted the selected design for the monument prepared by Mr. Greenslade, F.R.I.B.A. A letter was received from the town clerk, intimating that the Exeter city council approved of the design selected for the memorial, and assented to its being placed on the terrace on Northernhay, subject to the foundation being laid under the city surveyor's direction. A draft contract with Messrs. Hems and Sons was submitted and approved of.

The new technical school at Heywood will be opened by Mr. Snape, M.P., on Saturday, Dec. 1. The school is Renaissance in style, and is three stories in height; it is faced with Ruabon red bricks with dressings of terracotta, except the window-heads and sills, which are of stone. Accommodation is provided for 1,000 scholars, and the cost has been £7,000. Messrs. Woodhouse and Willoughby, of Heywood, are the architects, and Messrs. Blakeley and Bell, of Hopwood, the contractors.

WAYSIDE NOTES.

The Society of Architects has wisely taken a forward step which cannot fail to increase its prestige and usefulness. The report of the council on the proposed examination scheme was submitted to the general meeting of members on Tuesday night, and adopted. It now remains for the council to formulate its scheme of examinations, and at once to open its register of students. It would have been better, in my opinion, if the Society had decided at once to make its examinations absolute, and not to admit candidates of 35 years of age, actually in practice, for some time to come, without examination. That state of things, however, it may be confidently predicted, will not last very long, because, very properly, members who have won their membership by examination will take care to blackball all candidates seeking to crawl through the back-door the council leaves open. Men actually in practice—and there are many—who can hardly be called upon to pass examinations, have two years given them in which to join the Society of Architects without. If they do not do this at once, they will have no reason to grumble because they are shut out presently.

Mr. Edgar Farman's amendments, which were adopted by the council, are not likely to have any lasting effect. If it were otherwise, they would be disastrous. It is quite right and proper that the Society of Architects should recognise other examinations by competent bodies as sufficient tests for its own membership, while its own examination scheme is in a transition state; but it would be absurd to continue to do so after the Society's own examination is in full swing. I trust the new President and council will recognise these facts, and go to work manfully at once to prepare the scheme of examination, which is to be submitted and published before June 30, 1895. And meanwhile I urge on every "unattached" architect at once to apply to the secretary for a nomination paper and join the Society of Architects. Don't wait till just before the two years of grace is up, and then rush in like a flock of sheep afraid the gate is going to be shut. Join now, and give the council the benefit of your advice and experience in the consolidation of a scheme that will do much to raise the status of the profession, and to benefit the public.

It is pleasant to recognise that the good fellowship and resolution to pull together which have always characterised the deliberations of the Society of Architects have been well maintained all through the debates over this question of examinations, which, it is an open secret, has been a crucial one, and has naturally been productive of much division of opinion, both among members and on the council. Men like Mr. W. H. Seth-Smith and Mr. Alfred Stoner, who to the last opposed the idea, urged their objections with moderation and gentlemanly consideration, only, I am persuaded, to be equalled by the loyalty and heartiness with which, now the matter is decided, they will, as heretofore, work together for the good of the Society. It has ever been thus throughout the eleven years of the Society's existence; indeed, I know no society wherein legitimate difference of opinion has led to fewer discords. Much of this credit, it is only fair to say, is due to the tact with which the presidential chair has invariably been filled, and in no instance more so than to Mr. George Highton, who retired on Tuesday amid a chorus of congratulations on the effective and dignified discharge of his more than usually heavy responsibilities during the past year, which was as thoroughly deserved as it was hearty and unanimous.

Mr. George Highton will always be able to boast that he filled the chair during a year of unique character in the history of the Society. The past twelvemonths has been the first year of the corporate existence of the Society. And it redounds to its credit, and that of the past year's President and council, that they were not satisfied to allow the Society to sit down in the enjoyment of its new corporate advantages, but urged its members, at the earliest possible moment, to take advantage of the new facilities afforded to them to press further forward along the road of progress and consolidation, and to initiate the examination scheme, which I sincerely trust will be in full working order two years from now, and will attract year by year thereafter the cream of the profession.

A Parliamentary return, issued on Monday, contains several pages of public elementary schools in counties which have been "warned" or deprived of their grants, because of defects in buildings, &c. It is a most astonishing "black list," and shows nearly all down the alphabet how the conservers of the rates have resisted expenditure. In Lincolnshire there is a list of eight defaulters, Norfolk offers five, Suffolk, beginning with Bawdsey, is scheduled for five, erudite Oxfordshire for six, and Cambridge two; Essex for four, and Yorkshire for no fewer than fourteen. The cleanest sheets are offered by Bucks (1), Dorset (1), Monmouth (1), Rutland (1), and Wilts (1). Wales is a heavy defaulter for its size; but that colossal London is well looked after is shown by the black list including but two schools. I am myself, I confess, not quite so sure of the perfection of some of the London Board schools as the framers of this return seem to be.

I often see some curious attempts at architectural description in provincial newspapers. For example: Glancing over Saturday's *Shrewsbury Chronicle*, I notice an account of the rededication of the massive Perpendicular tower of St. Giles's Church, Newcastle-under-Lyme, after restoration. The intelligent journalist's comments are naïve:—"The parish church tower is probably the finest in the district, and of its *antiquity* there is no question, the bells having been first placed there in 1732!" How vastly remote then must be the days of good Queen Anne!

The Art Gallery Committee of the City of Manchester has arranged to hold an exhibition of contemporary arts and crafts, in the rooms of the City Art Gallery, in April next. It is sought to bring together a display of fine examples of industrial art, with a view to educate the public taste, and to stimulate the desire for all that is excellent in design and workmanship. Especially is it desired to identify the actual designers and skilled workers in respect of the exhibits offered. The committee hope to receive examples of decorative painting; sculpture and modelled work; wood, stone, and ivory carving; mosaic work, particularly in association with architectural and cabinet work; metal work, cast and wrought, and chasing in iron, brass, copper, gold, and silver; pottery and table glass; stained and painted glass; textiles, woven and printed; embroidery, tapestry, and laces; jewelry and other articles of personal ornament and use; clocks and watches; engraving and printing; book decoration and binding; printers' ornaments; illuminated and decorated MSS.; ornamental leather work; wall-papers, and other forms of surface decoration; photography; designs and cartoons for decoration of all kinds; architectural, mechanical, and ship models. The committee invite, and will I trust get, the co-operation of employers, trade guilds and societies, and of others interested in the promotion of artistic industries, with the object of insuring an exhibition of high merit. The schools of art and the various societies for the encouragement of art handicraft, which have of late been established in various parts of the country, will have in this exhibition an excellent opportunity of displaying the progress made. No charge will be made for space, and exhibitors will be permitted to put a price upon their works. Those wishing to exhibit should at once apply for a prospectus to the Curator of the City Art Gallery, Manchester.

At the Quebec Association of Architects, an instructive paper was lately read on "Foundations in Deep and Unreliable Soils," by W. R. Hutton, M.Am.Soc.C.E., in which the author alluded to many serious and expensive failures of buildings in the province of Quebec, as at Joliette, St. Bazile, St. Casimir and other places. The new Joliette church has a fine tower, which has sunk 11in., and has torn itself away from the adjoining masonry and façade to such an extent as to cause serious mischief; some parts of the church walls being thus overweighted have also sunk and given out. The authorities, to prevent this from going further, cut away the façade from the tower, so as to allow future settlement without dragging other parts. At St. Casimir, St. Nicolet, and other places, the churches have been seriously damaged from the same cause—viz., the failure to proportion the breadth of footings, so that every foot thereof should bear an equal load. At Joliette a bed of sandy clay about 8ft. deep, overlaid a bed of mud or clay of semi-liquid consistency some 20 or 30ft. deep; and the builders of the church excavated for the tower and façade to a lower depth than the aisle walls, by which the upper stratum of the solid soil of sand has been reduced in thickness, and a great tendency of the heavier tower walls to sink into the soft substratum is the result. Several Canadian structures have been damaged by the want of care in seeing that the bed of incompressible soil is of an equal thickness over the semi-liquid mud; wherever deeper foundations have been laid the effect has been disastrous.

OBITUARY.

Mr. J. B. McCallum, borough engineer of Blackburn, died on Tuesday evening. Three weeks ago he fell in the street, breaking his leg and dislocating his ankle. Blood poisoning and erysipelas set in, and a relapse proved fatal. Mr. McCallum, who was forty-four years of age, served his articles at Plymouth, and was afterwards appointed assistant engineer under the Liverpool Corporation. He was for six years borough surveyor of Stafford, where an important scheme of sewerage and other public works were carried out under his supervision. Twelve years ago Mr. McCallum was appointed, out of seventy-three applicants, for the position of borough engineer at Blackburn.

Mr. Eliezer Levi Montefiore, Director of the National Art Gallery of New South Wales, who died suddenly on Monday week, at Sydney, in his 75th year, had done much to foster a love of art at the Antipodes. The Sydney collection is housed in a building erected for the purpose in the Domain, or public park, and comprises many excellent works. Among these may be particularised "Les Enervés de Jumièges," by E. V. Luminais; De Neuville's "Rorke's Drift," for which the Colony paid £2,000; Luke Fildes's "Widower," for which the same price was paid. "The Gordon Riots," and "The Spanish Armada," by Seymour Lucas; "Wedded," by Sir F. Leighton, which cost £1,500; Topham's "Savonarola," Colin Hunter's "Salmon Fishers on Loch Fyne," Vicat Cole's "Arundel," Sir J. E. Millais's "Captive," Mr. Jacomb-Hood's "Triumph of Spring," one of the few nude subjects in Australia, which was purchased for £750; a Cattle piece by T. Sidney Cooper, R.A.; Sir O. W. Brierly's water-colour, "Venice: Weather Clearing up After Rain"; besides examples of Madox Brown, Keeley Halswelle, H. J. Mosler, W. L. Wyllie, A.R.A., A. C. Gow, R.A., David Law, Alfred Elmore, R.A., J. Sant, R.A., Louis Haghe, besides many others. Mr. Montefiore was a clever draughtsman and executed all the drawings in the illustrated catalogue to the gallery.

CHIPS.

Sanction having been obtained by the Portsmouth Town Council to the borrowing of £800 for replacing the present brick storm sewer from Burgoyne-road to Southsea Beach with a 36in. cast-iron pipe, the corporation authorised the borough engineer on Tuesday to carry out the alteration without employing a contractor.

New national infants' schools, seating 340 children, are about to be built in Bower-lane, Maidstone, from plans by Mr. Hubert Bensted of that town.

It has been decided by the parishioners of Holy Trinity Church, Blackpool, to proceed with the erection of a tower as an addition to the rebuilding of the edifice, which is now being carried out at an estimated cost of over £5,000. The additional cost of the tower is put down at £800.

The new portions of the Technical Institute at Coventry were formally opened on Tuesday week. The enlargement has cost about £5,000, and comprises a science lecture theatre, two large classrooms, carpenters' and mechanical engineering shops, gymnasium, &c. The plans were prepared by Messrs. G. and I. Steane, architects, of Coventry.

A selection from the objects recently discovered by Professor Flinders Petrie at Koptos has just arrived at the Manchester Museum, and was inaugurated on Monday evening. It includes two very fine granite carvings, one a colossal headdress of Rameses II., the other a baboon in black granite with a pectoral ornament representing a high priest of Amen named Fuamen adoring Tabuti or Thoth. Many carved objects in stone have been lodged in one of the wall cases in the historic-room.

Building Intelligence.

Camberwell.—The new Métropole Theatre at the junction of Coldharbour-lane and Denmark-hill was opened on Monday night. It has been erected from designs by Messrs. Crewe and Sprague, of Arundel-street, Strand. The first to be constructed in accordance with the stringent regulations now enforced by the London County Council, the theatre has a double frontage to two main thoroughfares. Seating is provided for 2,000 persons, of whom the pit and gallery will accommodate nearly 1,600. The interior decoration is Indian in character. The ceiling is a painted dome, with which the panels of the proscenium harmonise in tone. Fireproof material has been employed throughout the structure. The curtain consists of a steel frame with a double facing of asbestos, and the dressing-rooms are inclosed in a block separated from the theatre by brick walls and iron doors.

Heavitree.—The new chancel and transepts added to the parish church were opened on Sunday. Of the two transepts, one is used as an organ-chamber, and the other as a morning chapel. There are crypt vestries the whole size of the addition, which although more elaborate in design, it is not out of harmony with the nave, which was built about 70 years ago, while it is in complete accord with the new tower. It is of early 15th-century character. The interior arches are of stone-work, and the roofs are of solid oak. That of the chancel is waggon roof with moulded ribs, and on the south side of the chancel is a sedilia. The sanctuary steps are of Devonshire marble. The dressed stonework is from the Box ground quarries, Bath, and the stone for the walling is from Churston and Berry Head quarries. The architect is Mr. E. H. Harbottle, F.R.I.B.A., of Exeter, who also designed the modern tower; the general contractor is Mr. Lapthorn, of Plymouth; Mr. Dart, Crediton, undertook the oakwork, while the carving has been carried out by Mr. Rogers, of Exeter. The total cost has been between £4,000 and £5,000. The altar table, with super-altar, designed by Mr. Harbottle, are of English oak, and were carried out by Messrs. Harry Hems and Sons, Exeter.

Landport.—The new church of St. Agatha, in Conway-street, Landport, has already been commenced, and considerable progress has been made by Messrs. Light and Son, the builders, under the superintendence of the architect, Mr. J. Henry Ball, A.R.I.B.A., of King's-road, Southsea. The portion of the church at present in course of erection includes the nave, south aisle, and side chapel. The foundation-stone was laid on Saturday. The church will be in the Romanesque style, on the lines of the early churches of Lombardy. The nave and side aisle will be finished with semicircular domed apses. The columns of the main arcade are of polished granite, with Portland stone capitals and bases. The side chapel will form a complete church, accommodating about 250 persons. The total length of the edifice will be 124ft., with a width of 69ft. 6in., the nave having a span of 40ft. It will be seated for 800 persons.

Leith.—The memorial stones of the new infectious diseases hospital in course of erection for the Leith Corporation at East Pilton, Ferry-road, were unveiled on Monday. The hospital has been erected on the cottage principle, from plans by the late Mr. James Simpson, from which, with certain modifications, the hospital is being built, under the superintendence of Mr. George Simpson, who succeeded his father as burgh architect. An area of about six acres forms the site, but there are nearly other four acres adjoining, available for future extension. The buildings, which are of brick, include four ward blocks, isolation ward, administrative block, discharging block, laundry and disinfecting block, mortuary, reception rooms, and gate lodge. Each of the four ward blocks is to be divided into two, and in each division there will be ten beds, with two additional beds for private patients. In the isolation ward there will be ten beds, so that altogether there will be ninety-eight beds. The cost will be about £35,000. The contractors are: Mason, Mr. James Kinnear; joiners, Messrs. Drysdale and Gilmour; plumber, Mr. P. Knox; slaters, Messrs. M'Lean and Reid; plasterer, Mr. J. S. Sutherland.——A model lodging-house, erected by the corporation in Parliament-street, was also opened on Monday. The building is 30ft. by 45ft., and has a height of four stories above the basement. On the basement floor there is a cooking and dining-hall 38ft. by 34ft., furnace-room, clothes-drying apparatus, men's washing-house, and house washing-house, with two open airing courts at the back. A reading-room 39ft. by 35ft. is situated on the ground floor. Lavatories, bath-rooms, and superintendent's house and office are also provided. The three floors above consist of dormitories. There are 6 dormitories, 28 inclosed beds being fitted up in each, making in all 168 beds. All the pipes are brought to the face of the walls. The lodging-house is supplied with fire-hydrants and low-pressure heating apparatus. As in the case of the new hospital, the plans were designed by the late Mr. James Simpson, and were executed by his son, Mr. Geo. Simpson, burgh architect. The cost of the building and furnishings was between £5,000 and £6,000.

Middlesbrough.—St. George's Congregational Church was opened on Tuesday week. The church and schools cover an area of 1,280 square yards, the style being a free treatment of Early Gothic. The tower is 16ft. square, and rises to upwards of 100ft. The church itself, which is cruciform in shape, consists of nave, aisles, double-gabled transepts, and choir. The aisles are low and the windows small, lighting being chiefly by lofty clerestory windows and large openings in the gables. The roofs are barrel-shaped, finished inside with unvarnished pitch-pine. The choir is placed to the west, the end being apsidal, and is divided from the nave by a moulded arch. The floor of the choir is raised above that of the nave, stepped for the stalls, the pulpit being placed at one side of the choir-arch, the reading-desk on the other, with the communion-table between the two. The aisle floors are laid on wood blocks set in concrete. The stalls, and the nave, transepts, and choir are of pitch-pine. The Communion railing, Communion table, and pulpit are of oak and pitch-pine. The ground floor accommodates some 586 adults, and a small gallery provides seats for other 70. The windows are filled with tinted cathedral glass in lead frames. An organ chamber is provided on the north side of the choir. The Sunday-school buildings adjoin, and are three stories in height. There are six classrooms and recreation-rooms on the ground floor. The upper floor consists of a schoolroom 56ft. by 30ft., exclusive of a platform recess and further rooms, and accommodates 500 persons. The buildings are heated with hot-water pipes. Mr. J. Mitchell Bottomley, of Middlesbrough, is the architect, and the contractors are Mr. John Johnson, builder, Middlesbrough, and Mr. R. T. Snaith, joiner, of Darlington. The cost, exclusive of site, has been £5,600.

CHIPS.

Mr. Henry Harben has promised to give £4,000 for building a convalescent home near the seaside for working men of Hampstead and Kentish Town.

A Wesleyan school chapel was opened in Chard-street, Chard, on Friday. Mr. R Curwen, of London, is the architect; and Messrs. Lye and Sons, of Crewkerne, are the builders. The cost has been £1,000.

A crematorium is in course of erection in Priory-road, Liverpool, and is now being roofed in. Mr. James Rhind is the architect, and Mr. W. H. Forde, of Birkenhead, is the contractor. The cost will be about £3,000.

Colonel Langton Coke, C.E., held an inquiry on Monday at Oldbury on behalf of the Local Government Board, concerning an application made by the local board for sanction to borrow £1,000 for sewerage purposes. Mr. H. Richardson, surveyor to the local board, explained the plans.

At Kertch, in the Crimea, some workmen lately dug up a gigantic lion's head of Greek marble, 7ft. high, and in excellent preservation. It is to be sent to St. Petersburg, and exhibited in the Hermitage. It is supposed to belong to the 7th or 8th century before Christ.

A new organ has been opened at the parish church, Knaresborough. The specification was drawn up by Mr. Walker Joy, of Harrogate, and the organ was built by Mr. J. J. Binns, of Bramley, near Leeds. The instrument consists of three complete manuals and a separate pedal organ, and has cost £1,000.

A lych-gate, erected at the entrance to Berkswich churchyard, as a memorial to the late Judge Spooner, was dedicated last week by the Suffragan Bishop of Shrewsbury. It is of English oak with red tiled roof. Messrs. Chatfield and Wrench, of Stafford, were the contractors.

Engineering Notes.

Ayr.—The town council of Ayr recently voted a sum of money for securing the foundation of the centre pier of the historic Auld Brig o' Ayr, built in 1252, celebrated in song by Burns. The work is now complete. The burgh engineer, with the advice of Sir William Arrol, having removed a mass of concrete which was formed round the pier in 1883, built a brick wall under the foundations entirely around the pier, and some 4ft. lower than the oak frame on which the old foundations rest. This, it is believed, will securely inclose the clay under the pier, and, by widening the channel, lessen the force of the current during spates. Under the oak frame referred to can be seen the ends of small logs laid at distances of from 4ft. to 5ft. apart, crossing from side to side of the pier. The timber still looks sound after its long submersion in the river. The old bridge is now used only for foot traffic.

Edinburgh.—The town council have accepted the offer of Sir William Arrol and Company, the amount of which is £81,894, for the reconstruction of the North Bridge. The sub-contract for the mason work was given to Messrs. William Beattie and Sons, builders, Edinburgh. The design shows a bridge of three spans, each span being 175ft. It will have a uniform width of 75ft. between the parapets, which is practically the same width as the present North Bridge-street at its most northerly part. Except the piers, which will be of masonry, the structure will be entirely of steel, with ornamental cast-iron face work. The plans approved of provide for a uniform gradient from the post office to the High-street, which reduces the present gradient of 1 in 18 to 1 in 27. The scheme necessitates the taking down of the blocks directly at the south end of the present bridge—on the east and on the west side of the street; and another improvement effected is the additional width of the new bridge as compared with the existing structure—75ft. as compared with 54ft. between the parapets.

St. Louis, Missouri.—The Union Passenger station at St. Louis, claimed to be the largest and most costly structure of the kind yet built in any country, was officially opened last month. The cost has been £1,300,000 sterling. The station covers an area of 496,000sq.ft., and has been built from designs by Mr. Link. The main building or "head house," containing almost everything belonging to the station except the baggage-room, extends along Market-street from Eighteenth-street to Twentieth-street, and is thus two squares wide. The style is Gothic Renaissance, with the adoption of the round arch in place of the pointed, and Bedford stone is used as a facing material. The structure is irregular, the portion at Eighteenth and Market streets being separated from the middle one by one of smaller dimensions, and the western portion being set back beyond the middle one. The tower is 267ft. high, and is surmounted by a flat cupola. The main entrance is at the middle of the Market-street front. The roof of the train-shed extends the entire width of the station from Eighteenth-street to Twentieth-street. There are six points of support, thus dividing the shed into five parts. The shed has a liberal supply of skylights in the roof and at the ends, also on the Eighteenth-street side. Contrary to the usual custom, the shed does not rest on walls at its outer edges, but is left entirely open. In order to obviate the smoke nuisance, the Terminal Company has so planned the trackage arrangements that no locomotives are to enter the building.

Mr. H. T. Bulstrode, M.D., Inspector to the Local Government Board, held an inquiry at York, on Friday, into the circumstances under which the corporation apply for power to borrow £3,500 to purchase land for the extension of the Infectious Diseases Hospital at Yearsley Bridge, on the Huntington-road. Evidence in support of the application was given by Mr. A. Creer, the city engineer.

At a recent meeting of the committee of the Portal Memorial Fund a design for the proposed monument in Winchester Cathedral by Mr. Waldo Story was submitted and adopted. The design, which is Early Florentine in conception, will be executed in decorative marbles, and, should a sufficient sum be at the disposal of the committee, with mosaics in the background of the central group in high relief.

Correspondence.

"A DANGER TO THE PUBLIC HEALTH."

To the Editor of the BUILDING NEWS.

SIR,—The public are deeply indebted to you, and also to the editor of the *Local Government Journal*, for the exposure which has been made of so-called systems of mechanical ventilation by downward currents, and the manner in which the public health is being exploited in the name of sanitary science. Though those who advocate such systems may doubtless have substantial reasons for so doing, that in no way justifies the sacrifice of the public health, or purse, to private interests or prejudices.

Having lived in America, and taking an interest in the subject, I am fully cognisant of how the mechanical downward system of ventilation by impulsion was "boomed" there, just as is being done in this country at the present time on a smaller scale.

These "combines" did not, however, save the mechanical downward system from being ultimately discarded and condemned (as I observe it has been similarly condemned at the recent congress of the Sanitary Institute) by all but those financially interested in it and others immediately responsible for the expenditure of the large sums of money incidental to its application, for, independent of its being proved on the most unimpeachable testimony to be extremely dangerous to health, the downward system, as shown by the irrefutable data specially compiled by the United States Government (which also strongly condemned this system on every other point), is the most costly form of ventilation in existence, and yielding no equivalent value, but the reverse, for the money expended. It is easy to understand that, in this commercial and not over-scrupulous age, a form of ventilation, in the application of which much money is involved, would be operated by promoters in preference to any "natural" system, out of which, owing to its simplicity, comparatively nothing could be made.

It is a noticeable feature in connection with the commercial development of these mechanical systems that each inventor (?) or syndicate states, in explanation of the failures of similar systems, that the appliances used were defective and unscientifically applied, but that with *their* system "all will be well," generally backing up these statements with a display of tables of analysis of the air and volumes of air-supply truly marvellous, but, nevertheless, proved in their turn to be, as with others, something less than valueless. The ignorance of prospective clients of the subject is also relied upon as a chief factor in the successful negotiation of the business. The very timely exposure of this "system" and the mode of "working" it (which is nothing short of a public scandal, seeing that the matter is one of life and death) will doubtless have the effect of opening the eyes of at least the intelligent and thinking portion of the English people before they have had to pay so severely through the nose for their experience as our American cousins had to do. It is satisfactory to note from the newspaper reports that this awakening is seemingly already taking place in certain towns—Leeds in particular—where, amongst other matters, it is proposed to experimentally try mechanical ventilation, the Press taking the question up warmly in opposition, and meetings of the ratepayers held to protest against such unwarrantable waste of the public monies.—I am, &c., PUBLIC HEALTH.

Broadstairs, Oct. 29.

At the last meeting of the London School Board a report was received on the completion of the head offices of the Board. The work of alteration and enlargement has been carried out from plans by Col. R. W. Edis, F.S.A., in two contracts, each taken by Messrs. Higgs and Hill, of Crown Works, South Lambeth-road, at a total cost of £71,868 14s. 2d. It was agreed to pay Col. Edis's charges, amounting to £3,570 16s. 3d.

The Devon and Exeter Hospital is about to be reconstructed and enlarged, from plans by Mr. Charles Cole, of Exeter. The outlay will be about £12,000. Two new wings will be built for patients, the whole staff will be provided with sleeping apartments near the centre of the building, the kitchens will be removed from the basement to the topmost story, a new operating theatre provided, and the whole of the drainage reconstructed.

Intercommunication.

QUESTIONS.

[11237.]—**Granite Stone and Marble.** — Does any reader happen to know a work giving the locality of granite, stone, and marble quarries throughout the world? If so, I shall feel obliged with the name of publisher.—J. T. P.

[11238.]—**Glazier's Charges.**—Recently I gave an order for a small portable greenhouse to a builder of such things a few miles south of London. His price, £10 10s., I agreed to. In due time the greater portion of the woodwork arrived, but there was no staging, or several small things, such as capping for ridge, facia boards for ends, and not a particle of moulding. When the glass arrived, scarcely a pane would fit, and ¾in. to 1in. had to be cut off, as scarcely a partition in roof or ends were of the same width. All the glass sent was of one width, 14in.; of course this means a loss of time and expense in cutting. May I ask what the custom of the trade is in such cases? Also with regard to finding the staging and other things I have named? Some portion of the staging, I am informed, should be found by the builder of the house; but he says "none was estimated for, and none will be sent."—J. C. HOBBS.

[11239.]—**Open-Timbered Roofs.**—In open-timbered hammer-beam roofs is it necessary to sink into wall chases, the upright wall-posts, reaching from hammer-beam at eaves wall-plate line to stone corbels below? The reason I ask is that chases in walls seem to me a source of weakness to the structure.—IMPROVER.

[11240.]—**Bolting Stone Bases to Iron Pillar-Plates.**—What is the advantage of bolting down the iron plates of pillars to stone pier caps or bases? In my opinion, the process only means additional labour and expense, and weakens the stone bases under iron plates.—SCEPTICAL.

[11241.]—**Ventilating Strong-Room.**—Can any experienced reader tell me the best way to ventilate a strong-room? It is in a sunk flat, and at present has four small flues near the ceiling which go up to the roof of the building. There is a close smell in the place.—N.

REPLIES.

[11227.]—**Sound-proof Rooms.**—I would suggest either, or all, of three remedies. (1) Have only fixed furniture in maid's room, completely cover floor with a cheap thick carpet, and let the maid wear light slippers. (2) Otherwise, exchange rooms with the maid, if *she* does not mind. (3) Or lift the flooring boards and silicate cotton pugging. Repack the latter (not very tightly), and relay the flooring with strips of felt between joists and boards. In addition, censure the architect for not arranging a double set of joists to carry ceiling and floor separately, when he had been specially and definitely requested to insure a sound-proof room.—A SYMPATHISER.

[11228.]—**Quantities.**—The charge of 3 per cent. for preparing quantities is excessive. 2½ per cent. for small works and 1½ for large is a usual charge in London, a large proportion of the work being done for even less than this.—F. FIELD, 364, Fulham-road, S.W.

[11229.]—**Priming Internal Joiner's Work.**—I am obliged by "H. L.'s" reply to my query. However, it scarcely meets the case, as, no doubt, most people are aware, as I was, before asking the question, that the work can be done; but can he, or any of your experienced readers, state as to the advisability of priming joiner's work before taking same to building, and its being effectual in preventing the swelling of the woodwork as well as the flying of joints, arising from the absorption of moisture from plastering walls and ceilings, as ordinary joiner's work is principally done before, or while, plastering is proceeding. These points "H. L." does not touch upon. I noticed, while at Southport and neighbourhood, that a great quantity of the woodwork is so primed, the property in many instances being apparently built to sell. No doubt the priming in this case, in addition to preventing the taking in of moisture, does help to take in purchasers, who judge by outside show.—LEARNER.

[11230.]—**Steel Bearing Middle Gutters to Roofs.**—"H. L." says "this question is not very clear." I do not well see how it could be put more so, as I simply ask if steel middle-bearing gutters are an improvement over cast or wrought-iron ones, and if more durable than either of the metals named. "H. L." states, he "should say that steel would last longer in any position." According to this, he is not certain. Will some other readers give their opinion, and, if possible, their experience?—SCEPTIC.

[11232.]—**Domestic Hot-Water Supply.**—I beg to thank Mr. Angel for his detailed reply, and I hope he will not take offence at my telling him he is mistaken in stating that although, theoretically speaking, the flow-pipe to a hot-water cylinder should be greater in diameter than the return, yet in practice this is never carried out, as a plumber has carried out this very principle in some property I am interested in, and the effect is good, the flow being 1in. diameter, and the return ¾in.—TEACHABLE.

[11235.]—**Ash Vents.**—I quite agree with Mr. R. J. Angel that the old-fashioned ash vents (leading from underside of fire-grate up back of same to smoke-flue gathering) are not necessary or desirable, and in the most recent stoves are not generally provided for. Yet there are some clients and fixture setters who are still partial to same, as they say the ashes, &c., dropping out of grate are otherwise liable to fly about apartments in the form of dust, and this is to be avoided.—DOUBTFUL.

[11236.]—**Colouring Deed Plans.**—It is a long while since I was "in the drawing office"; but if my memory serves me rightly, I think, when our ink and colour would not run, owing to the paper becoming a little greasy, we used to mix a very small modicum of ox-gall with them, and that generally did the business. I much regret that, owing to the reason I have given, I cannot speak positively on the subject, so "E. H." must accept the will for the deed. He might, perhaps, try the recipe. Indiarubber, I think, only makes matters worse; but an ink eraser, very cautiously manipulated, is sometimes a useful assistance.—P. S. STRETONNE.

Legal.

LIABILITIES OF LOCAL BOARDS.

A PRINCIPLE of great practical and far-reaching importance was laid down and acted upon in the recent case of "Saunders v. Holborn Board of Works" (*Times*, 27th October), raising the whole question of the liability of Metropolitan local authorities for accidents occurring to individuals through their breach of duty in not removing snow and ice from the streets. The plaintiff, last January, slipped upon some frozen snow in a street within the area of the Board, and he now brought his action for damages based upon their breach of duty in neglecting to clear away the snow and ice. The County Court judge held there was no such right of action; and he appealed to the High Court. There the whole matter was gone into thoroughly, with the result that the decision of the County Court judge was confirmed. Briefly put, the point taken by the board was that, though they might be fined under the Act for breach of their public duty as to cleansing the street, there was no right of action against them for private injury, either existing in common law or given by, or resulting from, the statute.

Prior to 1891, and under a Police Act of 1839, the owners and occupiers of houses were compelled to sweep and clear away the snow and ice from their own pavements. By the Public Health Act, 1891, this duty was shifted to the various local boards as sanitary authorities, and for breach of this duty a penalty of £20 was thereby imposed. The defendants' contention that this was the only remedy for breach of duty was supported by the fact that before the statute, and at common law, there would have been no way of bringing an indictment against them for breach of duty nor an action for damages by a private individual. In fact, at common law there was no such duty as to the removal of snow and ice from the public thoroughfares; nor would it have been regarded as a nuisance, legally speaking. The whole thing, therefore, turned upon the statute, and as this gave no right of action to a private individual meeting with an accident by breach of their duty, the Court held that no such right existed. It was, however, admitted that in former cases the distinction between a penalty for a breach of a public duty and a claim to damages for a private wrong had been admitted. But later decisions showed that as the statute imposing such a duty indicated no intention to give a private right of action for damages, as well as a penalty for the public wrong by breach of duty, none could be presumed. The plaintiff's case, therefore, failed, and it follows that in all these matters the only thing to be done is to enforce the penalty given by the Act whenever the local authorities neglect to do their duty.

FRED. WETHERFIELD, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

NOTE.—All questions for reply in this column must be headed "BUILDING NEWS," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

H. B. J.—EASEMENT.—PRESCRIPTION.—Presuming you mean rights of way and the like, s. 2 of the Prescription Act, 1832 (2 and 3 Wm. IV. c. 76) deals with the two periods of 20 and 40 years. The former gives a practical and sufficient right of easement; the latter makes it wholly absolute and indefeasible.

LAWS. — LEASE. — MINE. — RIGHT OF SUPPORT.—Presuming the lease contains the usual covenant for quiet enjoyment, the lessor would seem to be liable in damages for breach by reason of the subsidence mentioned, while the right of the landowner and the colliery company to whom he has sold the minerals would have to be settled between themselves.

DOUBTFUL.—ARBITRATION.—ACCOUNT.—Practically, the arbitrator could increase some charges if he thought right, and reduce others, for his award would only give the total owing to the creditor. But the claim in dispute could not be increased as a whole.

A. T. C. W.—FOOTPATH.—PUBLIC WAY.—This was not a question of an easement or a private right of way; but of the public user of a certain path, and would not be decided by the Prescription Act, as you suggest.

W. W.—DRAIN.—SEWER.—The cases you mention do not decide any general rule as to the difference between a drain and a sewer which would govern your position. When the question arises, you can dispute it at the Court on the grounds you state.

Col. Ducat will hold a Local Government Board inquiry at Stafford to-day (Friday), as to the application of the corporation to borrow £45,000 for sewerage works.

LEGAL INTELLIGENCE.

A Builder's Responsibility.—A singular dispute was heard before Judge French and a jury at the Bow County-court on Friday, by which James Goodall, a carman, of Rotherhithe, sued Messrs. Perry and Co., builders, of the Tredegar Building Works, Old Ford, Bow, to recover £50 for injuries sustained through the negligence of defendants' servants. Plaintiff's case was that on May 1st, while leading a horse and timber cart along the approach to the Tower Bridge, he passed defendants' horse, which suddenly struck him, knocked him down, and the wheel of his own cart went over one foot, crushing the bones. He remained in hospital five weeks, and could do no work for fifteen weeks. The defence was that the horse was quiet. The jury returned a verdict for plaintiff for £20, and His Honour certified for costs on the higher scale.

The Fatal Collapse of Scaffolding at Plymouth.—At the adjourned inquiry held into the circumstances touching the death of Mrs. Rowan, who died from the effects of injuries sustained by the fall of a platform which had been erected at King-street chapel, the coroner, in summing up the evidence, expressed the opinion that Mr. May, the contractor, was in no way responsible for the deplorable accident. The arrangement was made with Mr. Nancollas, his foreman, and Mr. May was unaware permission had been given to use the structure which fell until after the accident. He asked the jury to find whether there was culpable negligence, and, if so, upon whom it rested. In case the jury found either the trustees connected with the transaction or Mr. May's foreman guilty of culpable negligence, he had no option but to advise the jury to return a verdict of manslaughter. The jury returned a verdict of "Accidental death," and exonerated all parties from blame.

A Neston Arbitration Case.—Mr. John Cullimore, Under Sheriff of Cheshire, sat with a special jury at Chester Castle on Monday to assess the value of the land taken from Mrs. Jane Scott, of Neston, by the Wirral Railways Committee in the construction of their new line. The claim was for £2,060, and the Company offered £970. Two acres of land were taken by the company, and 25 acres were alleged to be affected. It was contended on behalf of the claimant that she was entitled to claim not only for the clay contained in a portion of the ground but for its working value in the brickworks carried on there by claimant's husband. For the claimants, Mr. H. S. Whatley, F.S.I., valued the land taken and compensation at £2,060, Mr. John Cross, F.S.I., Manchester, at £1,954, and Mr. Edmund Kirby, F.R.I.B.A., Liverpool, at £2,027. For the respondent company, Mr. T. Taylor Wainwright, surveyor, Liverpool, assessed the total value at £759, Mr. Henry Hartley, surveyor, Liverpool, at £777, and Mr. Joseph Brattan, surveyor, Birkenhead, at £788. The jury returned a verdict for £1,200.

Appointment of Clerk of Works.—S. Hooper v. Bow School Board.—In this case, heard last week in a Devonshire county court, the plaintiff was an architect and surveyor at Hatherleigh. In April the School Board for Bow wrote to him and asked him to visit Bow and prepare plans for carrying out a new class-room. It was agreed that Mr. Hooper's services should be paid for on the lines of previous professional services which he had done for the Board in 1880-81. When the work was completed Mr. Hooper sent in his account, which amounted to £25 for charges, &c. An offer was made by the board to pay, without prejudice, his account less £10. Mr. Hooper declined to discuss the matter. Defendants paid into court the sum of £18 4s. The board's complaint was that they understood that a clerk of the works was required, but as they had not been applied to to make an appointment, they were not aware that one had been appointed. The point at issue was whether Mr. Hooper was entitled to charge £6 16s. 6d. in respect of that item. The contract was for £250. Plaintiff stated that he appointed his own brother as clerk of works. Witness did not mention to the board that he was going to appoint a clerk of the works. Cross-examined: It was necessary in a small work of this sort to appoint a clerk of works. Mr. Ellis, the contractor who carried out the work, said no complaints were made. For the defence, it was contended that the board claimed the right to nominate a clerk of works. James Crocker, architect, of Exeter, said it was the custom to consult a client before appointing a clerk of the works. He had never come across a case where the architect appointed the clerk on his own responsibility. A counter-claim was raised for damages and defects in the building. Mr. Crocker was called, and deposed to bad workmanship. William Layman, a builder, gave evidence. His Honour, in summing up, thought it a great pity that the case should be contested for such a small amount. No doubt the board contemplated the possibility of employing a clerk of works. Verdict was accordingly entered for the plaintiff with costs. Then it seemed curious that the board's counter-claim should amount to £6 16s., precisely the same figure as Mr. Hooper's claim. A counter-claim of that kind ought not to be encouraged. There would be a verdict for plaintiff for the counter-claim, with costs.

CHIPS.

A brass tablet mounted on a panel of dark red Italian marble, was unveiled on Saturday in Newton parish church, N.B., as a memorial of Sir J. Don Wauchope. Messrs. Hamilton and Inches, of Edinburgh, designed and executed the work.

Col. Ducat, R.E., Local Government Board Inspector, held an inquiry in the Board-room at Smethwick, on Tuesday, with reference to an application made by the Local Board for sanction to borrow £5,700, for the purpose of laying additional sewers, and £2,000 for house connections. Mr. A. Harris, the engineer, explained the proposals.

A stained glass window has been placed in the transept of the parish church at Dowlais, in memory of the late Mr. J. R. Jones, and presented by Mr. D. R. and Miss Jones. The window has three lights, the centre subject being "The Resurrection." In the left-hand light our Lord is depicted as "the "Light of the World," and on the right hand as the "Good Shepherd." The work has been designed and executed by Messrs. Jones and Willis, of Great Russell-street, London, W.C.

The directors of the Eastern Counties Coal Boring Association have accepted the tender of the Vivian Boring and Exploration Company, of Whitehaven, for carrying out the search for coal, and operations are to be commenced within the next few weeks. The first bore will be made upon the estate of Mr. W. J. Graham, at Stutton, opposite Mistley, on the Suffolk bank of the Stour, and about nine miles from Ipswich.

The congress of the National Free Labour Association at its meeting on Wednesday night in the Foresters' Hall, Clerkenwell, Mr. Chandler, the president, in the chair, unanimously adopted resolutions protesting against the re-introducing of an Employers' Liability Bill containing a clause forbidding "contracting out."

The Prince of Wales, who laid the memorial stone of the nave of St. Saviour, Southwark, on July 24th, 1890, intended to inspect the works in progress at the church to-day (Friday), and in anticipation arrangements have been made for electrically lighting the church. Although his Royal Highness is prevented from carrying out his intention, the church will be open to the public to-day between the hours of 3 and 9 o'clock, in order that persons taking an interest in the restoration may see how far the work has progressed. The amount expended in rebuilding the nave, restoring the north transept, and partially restoring the south transept, from plans and designs by Sir Arthur W. Blomfield, A.R.A., exceeds £31,000.

The association of contractors and builders for the Spen Valley and Heavy Woollen District held its inaugural dinner and meeting at the Crown Hotel, Heckmondwike, on Friday evening, Mr. William Isherwood (Cleckheaton), the president, in the chair. Alderman Moulson (Bradford) spoke at length on the advantage of combination.

The foundations of the new Church of St. Simon and St. Jude, Anfield, Liverpool, are now being dug out. The contractors who have the work in hand are Messrs. Chappell, of Walton. The church will be capable of accommodating about 600 persons, and will be built from designs which have been drawn by Mr. George Bradbury, the diocesan surveyor. The facing materials are brick with stone dressings.

The remodelled and enlarged church schools at Walton, Staffs., were dedicated by the Suffragan Bishop of Shrewsbury on Friday. The buildings have been renovated, and a room added 56ft. by nearly 20ft. Mr. N. Joyce, of Stafford, was the architect, and Mr. J. S. Burton, of Walton, the builder.

The laying-out of the Sparkhill Estate, near Birmingham, which has been in progress for some considerable time, is approaching completion. The architect, Mr. J. Statham Davis, has already prepared plans, &c., for a large number of commodious villa-residences thereon, and the total expenditure will probably exceed £100,000. The contractors are Messrs. Hughes and Son, of Sparkhill.

The foundation stone has been laid of a Wesleyan chapel at Garton, near Driffield, Yorkshire, on a site presented by Sir Tatton Sykes, Bart. The building will be faced with red pressed Lincolnshire bricks with stone dressings, and the interior woodwork will be in pitch pine. There will be accommodation for about 140, and the cost, including an additional room to accommodate about 60, is £600. Contracts for the various trades have been taken by Messrs. Gage, Rudd, and Walker, all of Driffield, and the architect is Mr. Joseph Shepherdson, of Driffield and Bridlington Quay.

STATUES, MEMORIALS, &c.

St. Paul's Cathedral.—The last of the series of statues of the Fathers of the Church, that of St. Ambrose, placed under the dome of St. Paul's, was lifted into its niche, on the north side of the building, on Tuesday evening. These monuments are eight in number—four Greek, St. John Chrysostum, St. Basil the Great, St. Gregory Nazianzen, and St. Athanasius, executed by Mr. W. F. Woodington, of Brixton Hill, under the superintendence of the cathedral architect, Mr. F. C. Penrose; and four Latin, St. Jerome, St. Ambrose, St. Augustine, and St. Gregory the Great, designed by Mr. C. E. Kempe, of Nottingham-place, W., and carried out under his direction by Messrs. Farmer and Brindley, of Westminster Bridge-road. These statues are sculptured out of Bere stone, from Seaton, have a height of 11ft. 1in., and weigh, including the plinth, about seven tons each. The figures are graceful, and their several characters well defined. The conditions under which they were executed presented considerable obstacles to the artists, because the lighting is principally under the figures, and reflected lights neutralise shadows, getting into even deep cuttings, so that the designers' chief attention has been directed to a graceful outline and pose, showing the whole length of figure, and that with precision.

WATER SUPPLY AND SANITARY MATTERS.

East Grinstead.—At the East Grinstead local board offices, on Thursday in last week, Dr. Sweeting, one of the Inspectors of the Local Government Board, conducted an inquiry concerning an application by the local board for permission to borrow £3,500 for the purchase of four acres of land at High Grove, and building thereon an isolation hospital. In explaining the scheme to the inspector, Mr. W. W. Gale, surveyor to the local board, said the land was four acres in extent, and ranged from 400ft. to 450ft. above the sea level. There were five houses within a quarter-mile radius, and 14 houses, all private, within a half-mile radius. It was 1¼ mile from the parish church, which was in the centre of the town. The site was bounded on the north and west by fields, on the south-west by a public road, and on the east by a railway cutting. The hospital generally would consist of five separate blocks—two wards, an administrative block, a wash-house block, and a mortuary block. Mr. Gale stated that his estimate of the cost of carrying out the plans was £2,916. The buildings were all 40ft. from the road, and 40ft. from each other. They faced due south. The cost worked out at £220 per bed.

Uckfield.—At their last meeting formal sanction was received by the Uckfield local board from the Local Government Board to a loan of £2,000 for sewage-disposal works. These works comprise the lifting of the sewage by pumps worked by a gas-engine a height of 80ft., and the disposal of the sewage by broad irrigation on eight acres of land. At present the sewage is screened and partially precipitated, and then discharged into the river. The new works were necessitated by the action of the East Sussex County Council, taken under the Pollution of Streams Acts. Mr. Wm. Willis Gale is the engineer of the scheme.

The Woodhouse Schools and the Normanton Common Schools, for the Normanton School Board, are being warmed and ventilated by means of Shorland's patent Manchester stoves, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

Further buildings of the most modern type have just been completed for the accommodation of the troops at Aldershot, from the designs, quantities, estimates, &c., of the R.E. Civil Staff. The new structure is to be called the Malplaquet Barracks.

Lord Ashburnham's famous Rembrandt, "Renier Ansloo and his Mother," the finest example in the country of that artist's work, has been sold to the Berlin Museum. The picture measures 7ft. by 6ft., and contains two whole length seated figures with accessories. It is to be regretted that the opportunity of securing the work for the National Gallery was allowed to slip.

The new school of the Stationers' Company in Ridge-road, Stroud-green, Hornsey, was opened by the Lord Mayor on Tuesday. The building has been erected by Messrs. Parnell and Son, Rugby, at a cost of nearly £14,000, in succession to the old premises occupied since 1858 until last year in Bolt-court, Fleet-street. Mr. Stanham is the architect.

The committee of the Bristol Royal Infirmary having decided upon making extensive alterations and additions to the out-patients' department of the above institution, has intrusted the contract with Mr. William Veals, of Cheltenham-road; Mr. Bruce Gingell, of Corn-street, being the architect; and Mr. Arthur Hutton, clerk of works.

Our Office Table.

THE *R.I.B.A. Kalendar* for 1894-5, published this week in anticipation of Mr. Penrose's opening address to the Institute as President next Monday evening, shows the usual tendency of all such official publications of societies to increase in bulk. Nine years ago it was issued as a small publication of 80 pages; this year it numbers 312 pages, against 296 last year. A useful feature, newly introduced, is a concise summary of the London Building Act of 1894. The list of subscribing members shows a slight falling-off in the number of Fellows—617, against 628 last year—but a large increase in Associates—872, against 828—while there are now 60 honorary Associates against 65 in 1893-4. Among non-subscribing members there is a decrease—11 honorary Fellows against 13; 49 honorary corresponding members in place of 53; but there are now 6 retired Fellows against 3 last year. The list of students has swelled from 73 to 101. The total membership in all ranks is now 2,273, against 2,122 last year, 1,922 in 1892, 1,739 in 1891, 1,595 in 1890, 1,418 in 1889, and 1,276 in 1884, the jubilee year of the foundation of the Institute.

THERE is yet another hitch in the arrangements for the extension of the Grand Pump Room at Bath. At a meeting of the city council of Bath, held on Friday, a letter from the Local Government Board was read relative to the recent inquiry by Mr. Bird Clerke as to the application of the council for sanction to borrow £30,000 for the extension. The board raised no objection to the proposed new buildings so far as the design itself was concerned; but they pointed out that the extension building would approach to within some 25ft. of the west front of the Abbey, and would be almost in a line with the north front of the present Grand Pump Room building. The extension would thus overlap the west front of the Abbey for about one quarter of its façade, and consequently the view of that front will be somewhat seriously interfered with. The board added that they understood that the site upon which the extension building was to be erected had hitherto been wholly occupied by ordinary houses; but that, in order to enlarge the view of the Abbey, a part of the proposed new building was to be only one story in height, and the corner nearest to the Abbey was to be rounded off. The centre portion, however, was to be of the full height corresponding with that of the existing Grand Pump Room buildings. The board felt that it will be matter for regret hereafter if the opportunity afforded by the demolition of houses recently occupying the site were not taken advantage of for opening up the space in front of the Abbey, so as to afford a full view of the west front, and before giving their sanction to a loan for carrying out the proposed scheme, they desired that the council should reconsider the matter with the object of setting back the proposed building, so as to be quite clear of the west front of the Abbey. The city council decided to reply, explaining that from the restricted nature of the site it would not be possible to throw the proposed new building further back from the Abbey churchyard without serious detriment to the accommodation required, that the plans before the Local Government Board show a recess of 5ft. from the original building line and from the line of the existing Pump room, with a low building on the north side only 17ft. high, and that the highest part of the proposed new building would be 56ft. from the Abbey at the nearest point. Compared with the frontage and height of the ordinary houses which have been taken down, the view of the west front of the Abbey would be considerably improved. The council therefore asked the Local Government Board to sanction the scheme, as the present ruinous condition of the site was prejudicial to the best interests of the city.

"LEGAL Restraints upon Auction-Room Ingenuity" was the subject of the inaugural lecture of the present session of the Auctioneers' Institute, given by Dr. Heber L. Hart, on Tuesday evening. Mr. F. Everill, Worcester, presided. Dr. Hart said that as soon as the auctioneer left his facts and gave scope to his imagination he must be careful, as a matter of legal obligation, to confine himself to generalities, and must scrupulously eschew particularity of statement. Without special authorisation he must not allow himself to be entrapped into giving a warranty; otherwise he might become personally responsible to the purchaser. Any deliberately pursued design to disparage the property which was put up for sale on the part of one who subsequently became the highest bidder would entitle the vendor to set aside the sale. It seemed, therefore, clear that the auctioneer need not accept the bid of anyone who had intentionally disparaged the property, and also that an action would lie for any special damage sustained by the vendor in consequence of such depreciation. Bids which must be refused were those made by the vendor or his agent, unless the right to bid was expressly reserved. Puffing was now illegal in all cases. Where the sale was simply announced to be subject to a reserve price no bidding on behalf of the vendor was permissible. In the case of a sale by trustees, a bid by any of them must be refused. The auctioneer must not make a pretence of receiving bids which were not, in fact, made. If he did, he might find himself made a defendant to an action by the purchaser, in which he would be liable to repay the deposit with interest, and the costs of the action. A bid by the auctioneer on his own behalf could not be maintained as against the vendor if he declined to complete, and as against the next highest bidder in the case of a sale without reserve.

THE council of the Sanitary Institute have arranged for a second course of free public lectures on the Sanitation of Industries and Occupations, to be delivered by well-known authorities, as they think that further knowledge on this important subject will be of utility to those who have charge of the public health in factory districts. This is becoming more than ever necessary, as the sanitary inspectors of local authorities have recently had cast upon them a large increase of work hitherto performed by factory inspectors, which has already led to special inspectors being detailed off for these duties in a number of districts. Many will, therefore, probably wish to qualify themselves with a knowledge of the sanitation of factories, workshops, and workplaces, with a view to obtaining factory inspectorships or inspectorships under local authorities in factory districts. The subjects embraced in this course of lectures will be as follow:—1, Coal Mining; 2, Quarrying of Various Kinds, Granite, Marble, Stone, Slate, Chalk, and Limestone; 3, Workers in Mercury, Phosphorus, and Sulphur; 4, Chlorine and Chrome Compounds; and 5, Workers in Copper, Zinc, Brass, and Tin. The lectures are being delivered in the Parkes Museum, Margaret-street, W., on successive Thursdays, at 8 p.m., the first having been given last night by Mr. Simeon Snell, of Sheffield.

THE concluding lecture of a popular course by Professor Boyd-Dawkins upon "Prehistoric Civilisation in Western Europe" was given on Saturday at Owens College, Manchester. Taking for illustration "The Contact with History," the lecturer explained how, during the age of bronze, the hunter and the herdsman were succeeded by a race of people who, with better weapons and instruments, acquired in Gaul and the British Isles a fuller mastery of the arts of peace and war. The dagger was lengthened out to form a sword, the spear was introduced, the axe (with handle firmly fixed in the head, as contrasted with the neolithic axe in which the head was invariably inserted into the handle) and arrow tips, still of flint, became more efficient for their purpose. The habitation, traces of which are found in Anglesey and other parts of Wales, now began to have some resemblance to the modern house, being circular in plan, with a conical roof formed of turf or straw, and with a hole at the summit for discharging smoke. The art of the bronze-using people was evidenced by the form and ornamentation of cinerary urns, drinking cups, bowls, and personal ornaments. Greater attention was paid to dress and appearance; pins were used, often bent to give more secure hold, and also the safety pin, the forerunner of the brooch. The mode of sepulture, the religious belief as indicated by the remains of their temples at Avebury and Stonehenge, were also detailed. Later, the use of gold and enamel came into vogue, and the employment of amber in jewelry. In the next age the use of iron became known, and the knowledge of the capabilities of the master metal of civilisation led to a general outgrowth in human affairs. Immediately prior to the historic period coinage was introduced. During these changes the individual gradually became merged in the family, and distinct tribes were ultimately formed, foreshadowing the organised effort which, in the Saxon Heptarchy, assumed a more complete development.

THE ancient High Cross from Bristol, built *c.* 1373 in Box Ground stone, was demolished in 1763 as an obstruction, and was given three years later by Dean Barton to Sir R. Colt Hoare, who re-erected it stone for stone in his park at Stourhead, Wilts. Having become dilapidated owing to the use of iron dowels and clamps in its reconstruction at that period, it is now being restored by Messrs. Harry Hems and Sons, of Exeter, under the direction of Mr. Charles E. Ponting, F.S.A., of Marlborough. Five or six years ago Messrs. Hems filled with statues the hitherto empty niches of the replica of the cross erected at Bristol in 1851 on College-green.

IN his fourth lecture on Egyptian History given at University College on Saturday, Professor Flinders Petrie described the profound change which affected Egypt in consequence of the Syrian conquests of the XVIIIth dynasty. In sculpture the new ideal was of a peculiarly sweet and refined type, without the boldness of earlier ages; the design was with less reserve and more emotional expression. The handwriting underwent a great change, and lost the thick forms which had prevailed. The manufactures, which had remained almost the same since the XIIth dynasty, changed greatly in style and aim, and the language largely imbibed Syrian words. In every department the middle of the XVIIIth dynasty, the 15th century B.C., was one of the great turning points in Egyptian civilisation, though not marked by any outward break in its history.

IN describing the conversion of Norwich Castle into a museum last week (p. 596), under the supervision of Mr. Edward Boardman, F.R.I.B.A., of that city, we should have added that the whole of the works, including new buildings, difficult structural alterations, works of renovation, and the provision of new cases and fittings were carried out, at a total cost of £17,000, by Mr. G. E. Hawes, of Duke's Palace, Norwich. At the formal opening of the Castle by the Duke of York on Tuesday week Mr. Boardman and Mr. Hawes had the honour of being presented to His Royal Highness.

CHIPS.

St. Mary's Church, Crundall, Kent, which has been lately restored at a cost of over £1,200, was reopened on Thursday in last week. The work has been done under the superintendence of the architect, Mr. E. P. Loftus Brock, F.S.A., the contractor being Mr. H. B. Wilson, of Canterbury. The three bells, too, have been re-hung by Messrs. Stainbank.

On Sunday, the 21st inst., Mrs. Chas. Prescott, of London, formally started a large clock, of which she is the donor, at St. James's Church, Wednesbury. It has three dials, chimes the Cambridge quarters, and strikes the hours. The whole of the work has been carried out by John Smith and Sons, Midland Clock Works, Derby.

The death is announced of M. Leon Palustre, of Tours, author of "La Renaissance en France," in which the architecture of that period was studied and analysed with scientific precision. He was the author also of "Melanges d'Art et d'Archéologie," and of "Trésor de la Cathédrale de Trèves," written in conjunction with Mgr. Barbier de Montaut.

Lord Rosebery unveiled, at Bristol, on Tuesday, the bronze statue of Edmund Burke, which has been presented to that city by Sir W. H. Wills. The statue, which has been erected in the open space at St. Augustine's Bridge, is the work of Mr. Havard Thomas. It bears the inscription, "Burke, 1774-80," and the quotation from his last speech in Bristol—"I wish to be a member of Parliament to have my share in doing good and resisting evil."

Mr. Robert J. Angel, A.R.I.B.A., of the borough engineer's office, Birkenhead, has been appointed assistant borough engineer to the Walsall corporation.

The Portsmouth Town Council had before them on Tuesday the report of the committee to whom two schemes of railway extension were referred for consideration. By one it is proposed to connect Portsmouth with Basingstoke by a new line, *viâ* Petersfield and Alton, and by the other with Winchester and thence, by means of the Didcot and Newbury Railway, with the Midlands. The committee expressed a decided preference for the latter scheme, and the council unanimously agreed with the recommendation. The preliminary expenses, which are estimated at £7,000, have been guaranteed.

MEETINGS FOR THE ENSUING WEEK.

MONDAY.—Royal Institute of British Architects. Opening Address by the President, F. C. Penrose. 8 p.m.

Society of Engineers. Adjourned discussion on T. W. Baker's paper on "The Utilisation of Town Refuse for Generating Steam." 7.30 p.m.

Sanitary Institute. "Sanitary Building Construction," by K. D. Young. 8 p.m.

Liverpool Architectural Society. "The Value of Archæology to Architecture," by E. W. Cox. 6.30 p.m.

Manchester Society of Architects. "Stained Glass," by Herbert Bacon, of London. 7.30 p.m.

Glasgow Architectural Association. "On Tramp," by J. Kennedy Hunter. 8 p.m.

WEDNESDAY.—Carlisle Architectural Association. Address by the President, C. Lonsdale. 8 p.m.

Carpenters' Hall. Lecture to Students in "Sanitation," by Professor A. Wynter Blyth. 8.0 p.m.

THURSDAY.—Parkes Museum. Free Lectures on "Quarrying," by Dr. C. le Neve Foster. 8 p.m.

Northern Architectural Association. "The Perpendicular Style," by D. H. S. Cranage, M.A. 7 p.m.

FRIDAY.—Architectural Association. "The Study of Modern Architecture," by A. Beresford Pite. 7.30 p.m.

DOULTING STONE.
CHARLES TRASK & SONS.
DOULTING, SHEPTON MALLET.
LONDON AGENT:
E. A. WILLIAMS, 16, CRAVEN STREET, STRAND, W.C.

FAMBRINI & DANIELS,
MANUFACTURERS OF IMPERISHABLE CONCRETE MASONRY FOR
CORNICES, STRING-COURSES, MODELLED PANELS,
AND EVERY STONE-WORK REQUISITE.
LANDINGS and **Plain** or **Moulded** and **Mitred STEPS**, durable throughout.
NO SPECIAL FACE REQUIRED.
WORKS AND OFFICES: LINCOLN.

HAM HILL STONE.
The attention of Architects is specially invited to the Durability and beautiful COLOUR of this material.
Quarries Well Opened; Quick Despatch Guaranteed; Stonework Delivered and Fixed Complete. Samples and Estimates Free.
Address:—
THE HAM HILL STONE COMPANY,
NORTON, STOKE-UNDER-HAM, SOMERSET.
London Agent:—
Mr. E. A. WILLIAMS, 16, Craven-street, Strand, W.C.

WM. OLIVER & SONS,
MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

BATTERSEA, S.W.—For erecting a laundry centre at the Sleaford-street School, Battersea, for the London School Board:—

		A.
Castle, W. and H.	£927 18 0	£22 19 4
Hammond, W.	856 0 0	24 0 0
Whitehead, L., and Co.	659 0 0	13 0 0
Akers, W., and Co.	620 5 8	18 3 1
Lathey Bros.	580 0 0	11 0 0
Kent, G. and F., Whitehead's-grove, Chelsea (accepted)	548 0 0	10 0 0

A.—If brickwork be built in cement, add.

[(*a*) Cost of tar-pavement and drains, £68; (*b*) laundry centre, 293; (*c*) works on site, £167; (*d*) extra depth of foundations, £20; (*e*) add for brickwork to be built in cement, £10; total, £558.]

BAYSWATER.—For new parochial hall, St. Matthew's, Bayswater, for the Rev. E. A. Stuart and the churchwardens. Mr. E. P. Loftus Brock, F.S.A., architect:—

Williams, G. S. S., and Son	£2,824 0 0
Dove Bros.	2,455 0 0
Nightingale, B. E.	2,395 0 0
Mattock Bros.	2,391 0 0
Barrett and Power	2,325 0 0
Williams, J. P.	2,240 0 0
Allen, J., and Sons (accepted)	2,150 0 0

BERMONDSEY, S.E.—For new and refitted offices in connection with all departments of the Monnow-road school, Bermondsey, for the London School Board:—

Downs, W.	£1,190 0 0
Lathey Bros.	980 0 0
Nightingale, B. E.	936 0 0
Akers, W., and Co., High-street, South Norwood (accepted)	924 0 0

BOURNE END.—For new bungalow and chalet, proposed to be built for Mr. F. C. Frye, M.P., at Bourne End. Mr. Arthur Vernon, 29, Cockspur-street, London, S.W., and High Wycombe, architect:—

Bungalow—

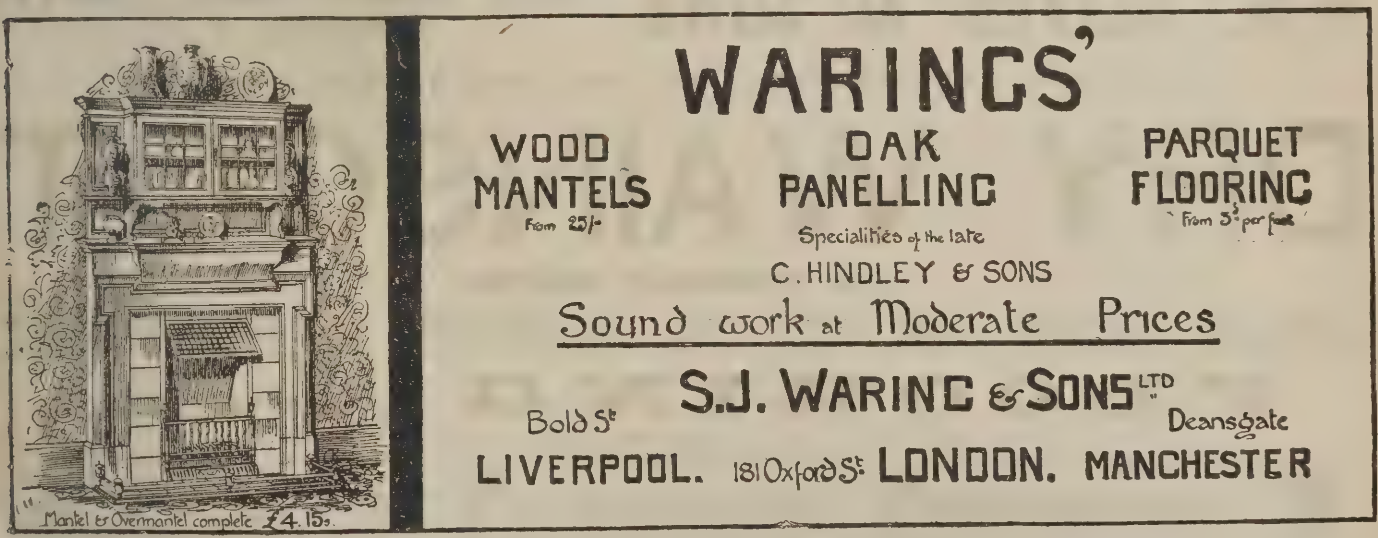
Edwards	£1,464 0 0
Cox, C. W.	1,446 0 0
Barker	1,387 0 0
Webster and Cannon	1,368 0 0
Gibson	1,345 0 0
Silver	1,338 0 0
Grist	1,338 0 0
Dickens	1,289 0 0
Hunt	1,270 0 0
Nash	1,269 0 0
Flint	1,227 0 0
Martin	1,220 0 0
Harris, H.	1,213 10 0
Loosley	1,205 0 0
Harris, J. T.	1,187 0 0
Smith	1,120 0 0

Chalet—

Edwards	1,316 0 0
Cox	1,315 0 0
Silver	1,219 0 0
Barker	1,190 0 0
Webster and Cannon	1,182 0 0
Harris, H.	1,160 10 0
Gibson	1,160 0 0
Hunt	1,124 0 0
Grist	1,118 0 0
Loosley	1,115 0 0
Nash	1,094 0 0
Martin	1,091 0 0
Flint	1,069 0 0
Harris, J. T.	1,054 0 0
Smith	1,050 0 0
Dickens	1,039 0 0

BRACKNELL.—For alterations to Priestwood House. Mr. J. T. Lawrence, Leighton Buzzard, Beds, architect:—

Brown, G.	£247 0 0
Parker	175 0 0
East, G.	160 0 0
Wheeler, E.	145 0 0
May, W. (accepted)	130 0 0
Clark, H.	129 7 0



Brighton.—For alterations and enlargement of St. Stephen's National Schools, Borough-street, Brighton, for the Rev. Prebendary J. J. Hannah, M.A., Vicar of Brighton, and the Rev. Canon C. Deedes, M.A., curate-in-charge of St. Stephen's District Parish Church. Mr. Charles E. Hewitt, 118, Queen's-road, Brighton, architect:—

				A.		
Garrett, W. and T.	£2,234	0	0	£108	2	4
Freeman, V. P.	1,787	0	0	122	0	0
Barnes, J.	1,757	10	0	121	0	0
Saunders, J. J., and Sons, Ivory-place, Brighton*	1,681	0	0	95	0	0

* Accepted conditionally.

A.—If extra revolving shutter in lieu of cross wall on ground floor, and extra movable cupboards are provided.

Brighton.—For new billiard-room at 7, Ship-street. Mr. Arthur Loader, architect:—

No. 1, with double-domed roof—

Botting, W., and Son	£1,240	0	0
Lockyer, G. R.	1,233	0	0
Barnes, J.	1,190	0	0
Field, W. A., and Co.	1,157	0	0
Taylor, W.	1,130	0	0
Sattin and Evershed	1,127	0	0
Freeman, V. P.	1,096	0	0
Saunders, J. J. G., and Son	1,082	0	0
Patching and Sons	1,078	0	0

No. 2, (alternative) with single-dome roof—

Taylor, W.	960	0	0
Garrett	928	0	0
Botting, W.	895	0	0
Field, W. A., and Co.	887	0	0
Barnes, J.	884	0	0
Patching and Sons	852	0	0
Kemp	845	0	0
Saunders, J. J. G., and Sons	835	10	0
Freeman, V. P.	824	0	0
Sattin and Evershed (accepted)	810	0	0

Bristol.—For alterations and additions to the out-patients' department of the Royal Infirmary. Mr. Bruce Gingell, Corn-street, Bristol, architect:—

Veale, W., Cheltenham-road, Bristol (accepted).

Bristol.—For furnishing South-street schools, for the school board:—

Brown, W. H. (accepted) … … £516 10 4

Bristol.—For heating and ventilating the Barton-hill United School, for the School Board:—

Crispin & Son, Bristol (accepted) … £293 0 0

Bristol.—For building a caretaker's house at Ashton-gate, for the School Board:—

Browning, J. (accepted) … … £280 0 0

Bristol.—For new caretaker's house, Ashton Gate schools. Mr. F. Bligh Bond, Liverpool Chambers, Bristol, architect. Quantities supplied:—

Messrs. Bale and Westlake	£415	0	0
Lovett, T.	408	0	0
Church, W.	397	0	0
Reed, T.	373	0	0
Humphreys, G.	365	0	0
Forse, H. A.	365	0	0
Perrott, T.	364	0	0
Walters, E.	360	0	0
Eastabrook and Sons	359	0	0
Hatherly and Carr	347	0	0
Wilkins, G. H.	340	0	0
Wilkins and Gosling	323	0	0
Hayes, C. A.	295	0	0
Browning, J. (accepted)	280	0	0

Cardiff.—For the furnishing throughout of the extension of the Free Library, for the town council:—

Lewis and Lewis, Cardiff	£2,701	9	2
Trapnell and Gane, Cardiff	2,596	14	0
Knight, T., and Sons, Bath	2,375	11	9
Lock, F. S.	2,374	10	3
Bessell, H., Bristol	2,230	4	4
Taylor and Co., Driffield	2,124	0	0
Turner and Sons, Cardiff*	1,849	0	0

* Accepted conditionally.

Colchester.—For re-draining cottage property in Butt-road, for Mrs. William Piper, of Ipswich:—

Cook, H., West-street, Colchester (accepted).

Edinburgh.—For the construction of the new North Bridge:

Arrol, Sir Wm. and Co. (accepted) £87,894 0 0

For masonry:

Beattie, W., and Sons, Edinburgh (accepted).

Hammersmith, S.W.—For the provision of a manual training centre in connection with the Brackenbury-road School, Hammersmith, for the London School Board:—

				A.		
Lyford, G.	£1,287	0	0	£17	0	0
Polden, S.	1,189	6	0	20	5	0
Cowley and Drake	1,122	0	0	37	10	0
Chinchen, F. T.	1,048	9	3	15	15	0
Kent, G. & F., Whitehead's-grove, Chelsea (accepted)	958	0	0	17	0	0

A.—If brickwork be built in cement, add.

[(*a*) Cost of manual training centre, £846; (*b*) works on site, £104; (*c*) extra depth of foundations, £8; (*d*) add for brickwork to be built in cement, £17; total, £975.]

Hendon, Middlesex.—For conservatory, &c., for Mr. W. R. Bousfield, Q.C., M.P, Mr. George Hornblower, A.R.I.B.A., 20, Fitzroy-street, W., architect:—

Tout, W. (accepted) … … … £255 0 0

Hackney, N.E.—For providing a new drainage, erecting new offices, and carrying out alterations to the existing w.c.'s and lavatories, at Turin-street board school, for the London School Board:—

McCormick and Son	£2,712	0	0
Knight and Son	2,358	0	0
Downs, W.	2,169	0	0
Calnan and Co.	2,118	0	0
Williams and Son	2,059	0	0
Staines and Son	2,055	0	0
Marsland, J.	2,055	0	0
Stevens Bros.	1,974	0	0
Triggs, E., The Chase, Clapham*	1,934	0	0

* Accepted.

Highgate.—For the erection of fence wall connected with the widening of Swain's-lane, Highgate, for the St. Pancras Vestry:—

Steed	£181	10	0
Wall, H.	159	0	0
Killingback	153	7	3
Davenall, H. G., Southampton Works, Gospel Oak (accepted)	146	0	0

High Wycombe, Bucks.—For new warehouse, &c., High-street, for Mr. A. Leadbetter. Mr. Arthur Vernon, 29, Cockspur-street, London, S.W., and High Wycombe, architect:—

Nash	£508	0	0
Harris, H.	505	10	0
Hunt	457	0	0
Dickens	454	0	0
Webster and Cannon	449	10	0
Flint	427	0	0
Gibson	415	0	0
Loosley	400	0	0
Harris, J. T.	382	0	0
Smith	380	0	0

Ilford.—For new Wesleyan Methodist church, High-street, Ilford, Essex. Mr. J. H. Carte, Upton Park, E., architect. Quantities by Mr. Henry Theobald, F.S.I., 87, Finsbury-pavement, E.C.:—

Hosking, G.	£5,067	0	0
Voller, F.	4,880	0	0
Harris and Wardrop	4,730	0	0
Atkin and Green	4,650	0	0
Scott, S. J.	4,549	0	0
Holloway, H. L.	4,540	0	0
Gregar and Son	4,367	0	0
Stroud, R.	4,360	0	0
Chessum and Son	4,310	0	0
Sharpe G.	4,295	0	0
Watson, W.	4,280	0	0
Pappin, J.	4,277	0	0

WM. OLIVER & SONS, 120, BUNHILL ROW, LONDON, E.C.,

HOLD THE LARGEST STOCK IN THE UNITED KINGDOM OF

DRY WAINSCOT

THE BUILDING NEWS
AND ENGINEERING JOURNAL.
VOL. LXVII.—No. 2079.

FRIDAY, NOVEMBER 9, 1894.

CONVENTION v. INVENTION.

THOSE who are constantly engaged in designing must have discovered how readily their thoughts and ideas fall into grooves. They are impelled by certain forces or by unconscious habit to adopt particular conventions, perhaps against their inclinations; they cannot think of anything better, or perhaps if they did, their imaginations are curbed by considerations of a practical kind or by the prejudices of their clients. There are many men who will adopt a plan because it is workable or has been in use many years, and who would not alter it if they could; others who work in a particular style because they are versed in it, or because they know little of any other; some who adopt a particular kind of construction because it is a form which the bricklayer and carpenter understand. Their clients have also to be pleased and their prejudices consulted. All these influences fetter and restrain the imagination of the artist, so that it happens it is perfectly hard to think of anything fresh. We have known a few men, the late W. Burges, E. W. Godwin, J. D. Sedding amongst others, who had the knack of breaking through the conventionalities—often at manifest risk to their success as architects; their designs for churches, houses, town-halls often set at defiance all recognised or accepted canons of plan, of proportion, or of detail. Those who can remember the very bold design of the late E. W. Godwin for the Memorial Theatre at Stratford-on-Avon, will discern much that was in advance of its time. Other of his conceptions were characterised by a freedom from restraint, but his plans were often crude and undigested. Sedding's work always possessed a freshness peculiarly his own, and he was one of the few who had the power of rejecting the stereotyped and commonplace, and yet of working in the true spirit of Gothic and Renaissance. It is one thing to throw off all restraint and invent new forms, and another to adapt the spirit of an old style without slavishly following its letter—the *ipsissima verba* of tradition. The former is easier to the man of small culture; the latter implies a keen artistic sense combined with knowledge. By this rule we must estimate the difference in the work of the untrained and uneducated designer and that of the trained architect.

In the work of the engineer we often find uncouthness, a direct violation of some architectural rule; the builder also goes direct to the root of the problem, but his work bears the evidence of a lack of taste. Yet each of these may teach the architect something. Many an engineering structure has taught the architect how to attack a problem, and sometimes so ordinary a building as a house erected by a builder may show how practical common sense may suggest a better method of doing a thing than architects could think of. The "rough and ready" practical builder is one of those who rush in where the more cultured artist "fears to tread;" he does not mind making a divergence in some point of plans however heterodoxical it may appear to many; the form of his building may be singularly anti-traditional and unconventional, his windows and doors innovations, and the details appalling. But for all this the design may perchance answer its purpose better than one quite correct as to models. The ordinary client who has himself a practical turn of mind will get on with a man of this type very well, far better than with an educated architect. Mr. Brown does not mind coaxing his client by giving way to him in such a point as introducing ordinary square sash windows of large size in a house of otherwise Gothic character. Gables and square panes, pinnacles and balustrades, columns and tracery are mixtures about which he has not the slightest scruple. Hence it is easier for a man of these free and open views who does not allow any traditions to hamper his mind to get on with the average client. The same client has a feeling of combined wonder and awe, if not of disgust, for Mr. Strictlines, who will not humour him in any particular whim if it happens to be inconsistent with the proprieties of style. The conventions and arrangements known to be in accord with Classic and Gothic are strongly ingrained, and he could no more think of anything outside than he could overcome his natural disposition. They have grown to be part of his nature. Thus we see that education and training have a good deal to do with that adherence to conventional forms and methods which appear to hamper our architectural progress in certain directions.

Take, for instance, the design of churches. They have for centuries been built on the Basilican model, because it affords the most commodious arrangement, and its threefold division is symbolical, and can be constructionally expressed. No better form can be devised for ritual purposes; but if preaching is considered the chief purpose, then no doubt it is not so desirable as the central "hall" plan. Again the chancel must be a pronounced part for clergy and choir. Those portions suggest appropriate treatment, and must be more or less similar in their external design, and, therefore, churches must all be alike to a greater or less degree, and afford little scope for invention. The domestic building may differ much in external grouping, but the room as the unit cannot be altered much: it must have doors, windows, and fireplaces. Other secular buildings like asylums, public offices, schools, &c., are regulated by customary rules more or less; and all these rules carry certain and appropriate modes of construction and ornament which cannot be easily altered without loss.

The stereotyped plan saves much thought, and is commercially profitable. Very few venture beyond the beaten track in their designs for buildings, except in those cases where the irregularities of site and other causes compel the architect to do something fresh. Many of our happiest designs have been inspired by necessity, by having to meet unexpected wants, thereby putting the artist's mind to a test. The tendency to follow in the worn track has other incentives besides saving of time and labour: it saves cost in building. The modern contractor is generally against all change and innovations, and when he sees a design on new lines he is apt to become fidgety and distrustful, and to add a percentage in his tender. Is it not the same aversion to anything new which has covered our fairest estates with stereotyped dwellings, and has placed in the hands of builders a great deal of the work which otherwise would have come to the architect? Independent design would have checked the mushroom growth of our towns. Blocks of dwellings and offices which at one time would have enlisted professional talent are now erected by builders all over London. Why? Because people will not ask for better. Is it not time for the profession to be on the alert? And is not the cause of this "leakage" to be found in the fact that the conventional plan has become in fact common property? If the speculative builder can turn out suburban villas by the hundred and city offices and residential blocks by the score, and with all the necessary appointments and decoration as well as the architect, there is nothing to prevent a similar encroachment on other domains. Conventions with all their merits may be purchased too cheaply. We live in days when cheap replicas can be obtained of the best art; when the decorative artist can turn out a drawing-room or a boudoir, or a saloon of a first-class steamship in the same style and with the same amount of effect, at least, as the best artists can produce, so perfectly as if possible to "deceive the very elect," and all this, it must be, at a loss to the original designer. Designs of the leading architects can be copied and travestied with a minuteness and expertness that defy detection. The best forms of doors, of windows, of columnar ordinances, wall panelling, carved and ceiling decoration can be copied in cement, stone, or wood, or reproduced in such materials as Lincrusta; while we have inferior and cheap reproductions of wrought iron and brass-work designed by the great workers in metal of the Middle Ages and the Renaissance. So, too, with the manufacturer of stained glass, in which some of the best designs are reproduced, and with other industries to which we need hardly refer. In all of them conventions have been stereotyped by machinery, by technical processes, and by manufacturers whose main object is to make a large profit. The manufactured convention enters into our best as well as our meanest buildings. Mere mechanicalism enters largely into our ornament and decoration. Our town-halls and even churches are not without the influence of mechanical decoration in a variety of forms, from the ornament of woodwork formed in plastic materials to the decoration of our walls and ceilings. Greek, and Gothic, and Renaissance ornament is stereotyped everywhere, and even our Schools of Art inculcate the copying of types, which are repeated in all textile manufactures and wall hangings. Machine production has in this case also been a hindrance to any original attempt to break through conventional restraint. And it is quite evident that this mechanicalism cannot be continued without detriment to progressive design, or without a sterilising effect on the work of the architect and artist. It is comparatively easy for a skilled draughtsman to become a slave of convention, but hard to disenthral the mind from customary ideas such as those we have described. Our best architects cannot altogether shake themselves free from stereotyped ideas, and those who have large practices fall helplessly into professional grooves. A very few can disengage their minds from those ordered conventions which seem almost to control the pencil. Even the expedients of construction have a trammelling influence. A girder can only be treated in one way, and the simplest feature, like a window, must be governed by the means to be employed in opening it. The one important point to learn is the real value of a convention, whether we can do a thing better by discarding all customary rules. To a very few is given the power of seeing a building or a design in quite a new light, stripped of all convention, and of giving form and appropriate decoration to it, without unconsciously repeating a platitude or a stereotyped expression.

◆

BRITISH BUILDING STONES.—XIV.

IN the BUILDING NEWS list of British Building Stones already published, the "Geological Formation" to which each kind of stone belongs is given in column 3 of that list. An explanation of the meaning of the term "geological formation," and the relation which one formation bears to another, for there are many, seems desirable. In columns 4 and 11 of the same list, certain technical expressions are frequently used, to understand the meaning of which implies some knowledge of mineralogy and chemistry, and it is no less desirable that the ordinary reader should be placed in a position to comprehend them. Any knowledge, therefore, of building stones worth the name, implies some acquaintance with the main facts of geology, mineralogy, and chemistry. This statement sounds rather alarming; but a few general principles deduced from these sciences, keeping rigidly to the particular object in view, will suffice to make clear to the most ordinary understanding, all that science can tell of the origin, composition, and relative position of all the rocks referred to in the Building News list. To a geologist any information of this kind would, of course, be superfluous; but it is not to be supposed that all who are engaged in practical building work are geologists, or that the majority of such have either leisure or opportunity to make themselves acquainted with even the rudiments of that science. It may be said that information of the kind referred to may be readily obtained by a perusal of any of the numerous and valuable works on geology recently published; but what the building operative wants is not so much a handbook of that science as a concise and familiar description of the rocks he has to deal with in his everyday work, divested of all needless technical expressions, and presented with as little admixture of scientific phraseology as possible. To understand the nature and proper use of building stone, it is necessary in the first instance to know something of physical geology, for this deals with the origin, mode of formation, composition and distribution of rocks, and with the various changes through which they have passed, whether physical or chemical. In geology the word "rock" denotes all the strata, whether soft or hard, which go to make up the earth's solid crust: the softest clays and loosest sands, as well as the hardest granites are therefore included, but the architect cannot conveniently extend his definition of a rock to include either of the former. For him, the rock must be sufficiently hard or indurated to allow, at least, of its being sawn with a plate or tooth-saw, and when on the banker to be worked with chisel and punch before being finally set in any building; it must be admitted, however, that some of the stones now used in building work come perilously near requiring the more extended definition of the geologist. All rock are derived from simple substances. Here it is necessary to make a slight digression to explain the meaning of the term "simple substance." All substances are either "simple" or "compound." A simple substance is one that cannot, by any known process, be resolved into two or more essentially different substances, whilst a compound substance is one from which two or more different substances can be obtained by analysis. An example will, perhaps, best serve to illustrate this difference. A piece of magnesium ribbon is composed solely of the metal magnesium. No matter what forces are brought to bear on this metal, in the present state of chemical knowledge, it cannot be resolved into any other substance: hence it is called a simple substance, or chemical "element." If this ribbon is now ignited, it will burn with an intensely brilliant white light, and the residue, or ash, is no longer the simple substance magnesium, but a totally new compound substance called "magnesia," or magnesium oxide. The metal which has disappeared can however be recovered by the chemist from the earthy ash produced by the combustion of the magnesium, which is now firmly bound up with oxygen derived from the air, and so completely altered and disguised that practically not a single property of the original substances magnesium and oxygen can be traced in this new substance. Continuing this digression, it should be noted here that in chemistry, when substances "combine," as the magnesium and oxygen in this example, they are not mixed in the ordinary meaning of that term. In a mixture, the substances mixed, no matter how intimately, can be seen, if not by the naked eye, with a microscope lying side by side. But no microscope has yet been invented that will show the particles or atoms of magnesium lying side by side with the particles or atoms of oxygen in the compound magnesia. Returning now to the rocks, all these are derived from simple substances which at one time existed in an incandescent condition; in cooling, these substances entered into combination with each other in certain definite proportions to form minerals of which the rocks are composed. It has been seen that when magnesium is burned in the air, heat causes the metal to combine with oxygen to form a compound. Chemical research has however shown that while moderate heat favours the combination of substances, intense heat will keep simple substances apart and decompose compound substances. Water is a solid when frozen, a liquid at ordinary temperatures, and a gas at high temperatures; at higher temperatures still water vapour is resolved into its constituent gases, oxygen and hydrogen. At a moderate temperature these gases combine to form water. At a higher temperature they are again separated. Hence all substances we know of possess at ordinary temperatures properties entirely dissimilar to that they possess at high temperatures. It is extremely probable that the earth was at one time in an incandescent condition—that is, all substances existed in an uncombined state as gases, and were maintained in this condition by intense heat. Of this early state of the earth there are two theories—viz., the nebular and the meteoric. The nebular hypothesis, first advocated by Kant in 1755, assumes that all matter in the universe was diffused throughout space in an incandescent condition, gaseous and nebulous, and that the formation of all suns and planetary systems, including our own, was due to the condensation and cooling of this heated gas. In 1796, Laplace advanced the theory that the solar atmosphere at one time extended beyond the orbit of the farthest planet in a heated and gaseous condition, and that the formation of the earth and other planets, with their satellites, was due to the cooling and consequent solidification of this atmosphere. Kant applied his theory to the whole universe; Laplace restricted his to the planets of our system only. The nebulous fiery mist of both these theories must have been of an extremely attenuated kind. Hydrogen, the lightest gas known, is 14½ times lighter than air. The original fiery mist must have been 100,000 times lighter than hydrogen! This would approximate, in popular estimation, to as nearly the original "nothing," from which everything was "created," as could well be conceived. Hence this theory was adopted without hesitation by those "whose philosophy begins where clear thinking ends." There are, however, certain facts known to astronomers which appear to be wholly incompatible with either form of the nebular hypothesis, and the difficulty experienced in explaining or reconciling these has become so great as to necessitate the adoption of some other hypothesis which will "square" better with well-known physical and astronomical facts. The most recent theory of the earth's origin is that of "meteoric agglomeration." This was first suggested by Mayer in 1848. He supposed that in very early times enormous numbers of meteorites of all sizes, moving at all velocities, in all directions, in orbits of all degrees of eccentricity, filled the entire interplanetary spaces, that these bodies frequently collided, generating heat enough to fuse the whole into one mass; this mass, losing heat by radiation, consolidated, and formed planets, movements of revolution and rotation being generated by the impact of falling meteors.

Whichever theory is correct, if either—the universal fog, or partial bombardment—it is tolerably certain that the earth, and all it contains, existed at one time in a molten condition, and that it is now cooling slowly from the surface towards the centre. The origin of all rocks is, therefore, igneous, and with this fact geology may be said to begin. The ordinary observer will be puzzled to know in what sense it can be said of the sandstones and limestones now quarried that these existed once in a molten condition? These rocks in their present state were not consolidated direct from a fiery magma, yet the minerals of which they are composed did at one time exist in a molten and fluid state. These, however, have undergone such subsequent changes, by various physical causes, that almost all trace of their igneous origin has been obliterated. The first land surface was probably uniformly spherical, and without elevations or depressions of any kind. Hence the first sea must have been universal, and until a subsequent period there was no dry land. It is supposed that, owing to the close proximity of the moon at this period, the universal sea was subject to tidal waves 500ft. or 600ft. high, and these must be taken into account in estimating the forces operating for the destruction of lands which subsequently appeared above the waters. Simultaneously with the formation of a solid crust or shell round the molten earth, and with the formation of the sea covering it, extensive earthquakes and huge volcanic eruptions set in. Mountain chains were upheaved, and corresponding areas depressed, by a force to be presently explained; the newly-formed solid crust was rent and fissured in every direction. This disturbance, which commenced, possibly, about 500,000,000 years ago, continues to the present day, occurring periodically, but reduced in intensity, owing to the resistance offered by the greatly increased thickness of the outer shell or crust of solid rock. The force referred to, as being competent to produce great changes in the earth's solid crust, is volcanic energy; and the causes of this are internal heat and the loss of it by radiation. It is found that as the depth from the surface increases the temperature rises at the rate of about 1 degree Fahrenheit for every 50ft. or 60ft. The depth from the surface to the centre of the earth is 20,923,831ft. Borings have been made to a depth of 4,200ft. only, so that it is not possible to say if the temperature increases above that depth at the same rate, or becomes constant at a certain depth; but that an enormous amount of unexhausted internal heat exists is proved beyond all doubt. From the foregoing fact it is concluded that the earth is gradually cooling from the surface inwards, that the outer layers of the crust have lost their original heat, and that they have, in consequence, ceased to contract. Now, underneath these solid layers, and attached to them, are masses of rock in a molten or semi-molten condition, which, though still retaining an enormous amount of heat, are losing it gradually, and are, in consequence, contracting. Forming, as these molten masses actually do, part of the rocks immediately above, and in contact with them, the effect of this contraction will be to pull the upper layers together horizontally. But, as it is impossible to compress the rocks, the force exerted takes an upward and outward direction, upheaving the surface at right angles to the lines of lateral pressure, forming mountain ridges and valleys, as we find them, for upheaval is invariably accompanied by subsidence. This process of upheaval may be sudden or gradual, affecting extensive areas or limited ones. Sudden upheavals to great heights are generally accompanied by great dislocations of the strata affected, and extensive cracks or fissures are developed, whilst gradual upheaval may take place without

apparently producing any such phenomena. In certain localities volcanic disturbance is not confined to upheaval only, but is marked by eruptive action also. The heat which produces this is probably caused by the arrested motion of lateral pressure, actual eruption taking place only when water in large quantities percolates through to the vicinity of the highly-heated rocks. It is a well-ascertained fact that rocks under enormous pressure may be subjected to intense heat without melting, but if the pressure is removed they liquefy at once. It can be imagined that water in contact with rocks of high temperature will develop enormous pressure, and this will exert itself in the direction of least resistance. The pressure being thus removed, the water will flash into steam, the rocks will assume a molten condition, and be ejected from the fissure with great violence, giving rise to eruptive volcanic action, which will be continued until all the pressure is exhausted. This eruptive action is usually intermittent; but as stream after stream of molten matter is discharged and consolidated, the whole assumes a roughly conical shape around the discharging orifice or crater, which is preserved in the centre of the mass. It was at one time thought that all great mountain chains and other elevations were due to direct upward pressure; but this theory is now abandoned for that of upheaval induced by interrupted horizontal contraction. It was also thought that volcanoes were chimneys, or safety-valves, in the earth's crust, through which the central fiery mass boiled over; but this theory is exploded, for contraction as above described is sufficient to account for all known volcanic phenomena.

The first dry land upheaval was necessarily crystalline rock of igneous origin. With its appearance, forces potent for its destruction came into operation, and sedimentary or stratified rocks resulted. All these latter are, therefore, composed of the waste of the former. The forces referred to were chemical or mechanical. Rain holding carbonic acid in solution fell in torrents on the newly-formed land, disintegrating and decomposing the surface; streams, watercourses, and rivers washed away the decomposed material, and deposited it in the sea; frost, acting on water-saturated rocks, burst them to pieces; rivers deepened their channels and wore away their banks; the sea itself, agitated by storms and huge tidal waves, washed away the ancient coasts; all the waste produced by "denudation" being carried away by water or moving ice, to be finally spread in layers or "strata" over the bottoms of the ancient seas or lakes. The materials deposited in this manner consisted of clays, sands, and gravels. Subsequent pressure and the infiltration of cementing matter caused the various beds to consolidate, and in this manner sandstones, slaty rocks, and some limestones were formed. The rocks so-formed were in their turn up-heaved, then worn down again, "denuded" in geological phraseology, and spread over the sea bottom; and this incessant round of destruction and reconstruction continues. At the present rate of denudation, it is estimated that in 5,000,000 years, all our present continents and islands will be worn down and buried beneath the waves. It is obvious that, as the sedimentary rocks were deposited in water over large areas, and in beds or strata of nearly uniform thickness, these must have been laid down to a "dead level," or nearly so. Upheaval has, in many cases, tilted these beds at various angles with the horizon, and sometimes even set them up on end—that is, at right angles to the original plane of deposition. It is, therefore, certain that rocks, such, for instance, as the lower oolites, now found on the tops of the Cotswold Hills, were once some hundreds of feet under the level of the sea, and that the beds of these rocks, no matter what their present angle with the horizon, were then parallel with it.

SELBY ABBEY—EAST FRONT.

THIS well-known abbey has just been restored as regards the chancel, and now the tower is about to be taken in hand. There are some beautiful small Norman windows in the tower, but the unsightly and incongruous balustrading and cornice, to say nothing of the pinnacles, spoil what is otherwise a splendid specimen of an English Gothic abbey church. The sketch we publish to-day is by Mr. R. A. Easdale.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE sixty-first session of the Institute was inaugurated on Monday evening. Mr. F. C. Penrose, F.R.S., the President, occupied the chair, and there was a large attendance of members and visitors, including some ladies. It was announced that, in accordance with the by-laws, Mr. Francis Lennox Canning, of Johannesberg, had been reinstated as a Fellow.

THE PRESIDENT'S OPENING ADDRESS

was then delivered. Mr. PENROSE congratulated the members on the fact that the Institute had continued to gain, both in position and in members; but he regretted that, while the roll of Fellows and Associates was steadily growing, that of Honorary Associates was diminishing, having fallen from 115 in 1878, to 60 in 1894. Some had thought that, as an hon. associate paid a subscription of two guineas, and an entrance fee of like amount, the title was anomalous, because the term "honorary" should imply that such member was not a subscriber, but the President contended that the word honorary was used in the sense of the English word "lay," or the French "libre," as a conferring of honour. He also thought the class of Honorary Corresponding Members should be strengthened—it had fallen from 55 in 1842 to 49—and called attention to the fact that at present there was not a single representative of the architects and archæologists of Russia on the list.

It was now generally recognised that the examination in architecture had fully justified its establishment; at any rate, it had become a great fact. The present month brought the former and partly tentative arrangement to a close, and from henceforward begun the system of progressive examinations. The President considered that these examinations could not but have an excellent effect: first, and directly, in securing to future members of the Institute the reputation of having satisfied a certain standard of proficiency; secondly, and indirectly, by excluding from the Institute in the first instance, and by reaction from the profession at large, young men whose abilities would have been more advantageously directed towards the pursuit of some other calling. A summary of the examinations of the past official year gave the following results—namely: (1) In the Preliminary examination 165 attended: only one was "plucked," 28 were relegated for a term, and 136 passed; (2) in the Intermediate examination 55 attended: not one was rejected, 19 were relegated for periods, and 36 passed; (3) in the Qualifying examination 176 applied, but only 150 attended: 3 were rejected, 84 were relegated for periods, and 63 passed. He welcomed also the signs of useful examinations in building construction inaugurated by other bodies. The revived guild action of the City companies was a circumstance favourable to sound execution. He had had pleasure in following in the steps of their former presidents, Messrs. Anderson and Waterhouse, in assisting at examinations conducted by the Worshipful Company of Carpenters. The President drew attention to the present position of district surveyors in London, remarking:—A new Metropolitan Building Act has passed the Legislature, with so many new provisions that it seems to require much study on the part of those who have to enforce it as district surveyors, or to obey it as architects. For some of the enactments, at any rate, we may be thankful. I refer particularly to those which impose limits—lofty enough, indeed, but still limits—to the height to which houses may be carried both in front and back. For amendments in many provisions of the new Act, made after long and careful consideration, the metropolis is largely indebted to our Practice Standing Committee, as also to Mr. Arthur Cates, Mr. T. M. Rickman, and Mr. Edwin T. Hall, who, with representatives from the Surveryors' Institution, attended a prolonged conference on parts of the original Bill with the London County Council. I will not, however, enter into the subject, but await the abstract of the Act which our Fellow, Professor Banister Fletcher, is preparing, and the publication of which is promised before the end of the year. Under this measure—the London Building Act, 1894—which comes into force on the first day of next year, the Institute still remains the examining body for granting certificates of competency, without which no person can become a candidate for the office of district surveyor in London. This stautory examination, until the present London County Council imposed a condition that a district surveyor shall not practise as an architect, was always well attended, and those who presented themselves for examination were generally men who had not only received the education of an architect, but had practised as such. Not long ago this statutory examination was held quarterly, and the examining board had then much to do in order to finish the oral part of the examination on one day. But now, very few persons apply to be examined, and during the last official year the two examinations announced to be held did not take place, owing to the want, or perhaps the paucity, of candidates. Yet a district surveyor, if he is to do his duty by the London Council who appoint him, as well as by the architects whose buildings he has to inspect, should have that knowledge of architectural science or building which can only be acquired by an architect who has been engaged for, say, seven or ten years in the active practice of his profession. I will not go into the question whether a district surveyor ought or ought not to be allowed the right of private practice, but I am certain that he ought to have practised as an architect before attempting to fulfil the duties of a district surveyor under the London Building Act. Is there, then, anything unreasonable in the thought that the London County Council would be wise in including among the conditions of such appointments the proviso that every candidate for the office of district surveyor in London shall have previously qualified for admission to the class of Associates of this Institute, and have either passed thence to the class of Fellows or have become admissible, by length of practice, to that class? We have lately seen brought to completion by our honorary Associate, Mr. Wolfe Barry, the Tower Bridge, a great engineering work with which the late Sir Horace Jones was originally associated as architect. If he had lived to superintend the completion of the design of such parts of it as lay in his department, he would probably have left the towers more massive than they are. It is, indeed, greatly to be wished that association between architects and engineers, in cases where their provinces overlap, were more frequent than it is. I well remember Professor Cockerell regretting a lost opportunity of the kind in the case of Waterloo Bridge. Sir Robert Smirke had offered his assistance to Mr. Rennie in profiling and adjusting the Doric columns which formed part of the engineer's design; but the latter declined. The baldness of those columns is a serious defect to the beauty of the bridge, which, indeed, would have been handsomer if the columns had been omitted altogether; and one of the good results of the Tower Bridge is that it relieves us from the necessity of tampering with the noble simplicity of London Bridge. In contradistinction to works which are satisfactory for their actual or hoped-for achievement, I feel called upon to mention one, of which the stoppage would, it seems to me, be matter for congratulation, and to express the hope that no further progress may be made with it, unless it be to convert what already has been done into something far less pretentious than the original intention, calculated to spoil the scale of everything else for miles around it. I need not explain to anyone here present that I refer to the incipient structure of the huge steel tower at Wembley Park in the north of London. Possibly, if its lower story were turned into something of the nature of the hanging gardens of Babylon, it might be an interesting and unobjectionable structure; but if the original scheme is to be carried through, you will, I think, agree with me in wishing confusion to a new Tower of Babel. Again, with regard to another point, which is not, I fear, so much attended to as it ought to be. It cannot be too strongly insisted upon, that in the case of old buildings of established architectural merit, when new buildings are erected by their side, the utmost care should be taken that the new works do not injure the effect of the older. I think many of us must have been often much pained in witnessing such injurious treatment of old venerated monuments. A case of the kind has occurred, but not recently, at Exeter. There was till comparatively lately, as in the case of several of our cathedrals, immediately contiguous to the west front of Exeter Cathedral, a small church, of no remarkable architectural value certainly, but which by its very smallness gave valuable scale to the cathedral. At a later visit I found it had been replaced by a church of much larger proportions, and the merit with reference to the cathedral which its predecessor had was entirely lost. In my opinion, though the wants of the parish may have required the enlargement of the church, there was no occasion for the architect to have so raised the tower and spire as to overtop the venerable cathedral. I shall not attempt to meddle with the controversy which some time since was raised as to whether architecture is an art or a business. The two elements are no more separable than are faith and works; and our teaching to students properly takes cognisance of both. To the art element, and the thoughts more immediately connected with it, I propose to confine myself in what I have still to say to-night. The original sources from which we derive our art must always have an intense interest for us, and whilst we are in hopeful expectation of new light being thrown upon Greek archæology from the researches of the French architects at Delphi, under the experienced and skilful guidance of M. Homolle, the Director of the French School at Athens, we are not indifferent to grievous tidings which come from Egypt—a strange proposal which, having been more or less vaguely in the air for some time, has recently assumed alarming consistency. I refer to the proposed Nile barrier, to be built across the river at Assouan for the purpose of storing up the waste waters of the annual inundation in a huge reservoir, in such a manner as to submerge and ruin a series of the most beautiful and interesting remains in the country. The deluge which is threatened would extend from Assouan as far as Korosko, a distance of fully 100 miles, forming a lake of which there would be no parallel in Europe, submerging the Island of Philæ, with its celebrated group of temples of the highest beauty and artistic value, and eleven or twelve other important sites, particularly the fine and very perfect temple at Kalabsha. In addition, moreover, to what we know would be lost, it should be noticed that, as the region of Nubia, in which they occur, has not been so carefully examined as most other parts of Ancient Egypt, it is more than probable that many objects which would otherwise reward future exploration if they remained, as now, accessible, would be lost for ever. Again, if anything happened to the dam, what would be the fate of Lower Egypt, and all its inhabitants and all its treasures? We need not fear but that the engineers would do their best to make it secure; but sad instances of the failure of reservoir dams, where everything ought to have been well constructed, are not unknown to us, and the region has been subject to earthquakes so violent as to throw down even Egyptian structures. The proposal has, unluckily for one point of view, much that is tempting to utilitarian minds, and we are not as a nation exempt from the reproach of yielding in cases where men of business have had to choose between sentiment and prospective gain. In the case of the Nile barrage, we must do the Egyptian Government the justice to say that they would seem to deplore the injury to art and history which would follow; but the premium which is held before them is so large that we may feel sure that any attempt to oppose an absolute negative to the scheme would be simply futile; nor would it be right. Our own Government, again, is doubtless in no enviable position in the matter. If by an exercise of power we were to prevent the work from being undertaken, it is easy to see what a deep and, maybe, dangerous feeling of disappointment would arise in Egypt; whilst if they consent to it, our rulers, both at home and abroad, would incur much obloquy. It has been suggested that a dam of less elevation, placed above instead of below the Island of Philæ, would for a long time answer all legitimate demands for water storage, and would involve a much smaller sacrifice of valuable antiquities or disturbance of inhabitants; and if at some future time the demand should arise for a larger supply, other means not now available—new sites, for, instance, above Wady Halfa—might be found. We may, at least, hope for the escape of Philæ and some other of the Nubian antiquities, and this gradual method of procedure would seem to fit in with the expectations of the proposers of the barrage, for the supposed profits on which the scheme is based are not to flow in at once, but, as Mr. Garstin himself says, the *great expectations* are founded on an eventual increase "which it will take years to arrive at." As regards the main proposal of this barrage, we have, indeed, no resource but hope; and in this I am encouraged by the remarks of Sir John Fowler, who presided at a recent meeting of the Egypt Exploration Fund, when he took occasion to state that there was now little danger of the destruction of Philæ; that further inquiry had shown that the material necessities of Egypt and the claims of archæology were capable of reconciliation. Turning homewards, it may be useful to institute a comparison between some of the results of architectural work of the present, as compared with an earlier period in this country. In making this comparison, we must not lose sight of the great differences in the two periods, both in respect of the demands upon the architect, and of the materials available to his hand. The greater complexity of the conditions of modern life is unfavourable to the modern architect in some respects. It requires him to spend a large portion of the funds available for a building in work which, however important, can produce no æsthetic effect, and the many calls upon him to satisfy a variety of wants must necessarily make it very difficult to secure that charm of simplicity and proportion which is an essential ingredient in work of the highest quality; indeed, with so many importunate claimants for attention, the time which must have been devoted to rhythm and harmony by the older architects can now seldom be spared. There is, therefore, a great temptation to accept a premature solution of the problem, provided the requirements of the plan appear to be satisfied, and provided the resultant grouping, however haphazard it may be, accords with some ideal of picturesqueness which natural or acquired taste can generally secure. I do not, however, venture greatly to blame this result. It is far better that a good plan should command the obedience of the elevation than that a preconceived symmetrical elevation should force the plan into inconvenience. Nevertheless, a more excellent way is almost always possible where the plan shall still rule, but with all the difference between marching order and broken ranks; and it may require more time for working out than can be spared in any particular case. Genius has been defined as a power of indefatigable study. Such genius is indeed very necessary for the highest achievements of architecture. There are certain buildings, such as club-houses, theatres, town halls, and, above all, ecclesiastical structures, which lend themselves much more than others to be treated by the rules of Art; but there are none, not even the most humble, which may not be improved through study with an eye that loves proportion. It is a duty the profession owes to the public to do this on every possible occasion. To return to my comparison between the older and later architectural works. There is a point which seems to be deserving of attention, but whether it admits of being to any great extent brought into operation I do not venture to say. The modern architect, owing to the way in which drawings, specifications, and bills of quantities are prepared, and the exactness with which contract works are expected to follow out those documents, has seldom if ever the same freedom in studying his design as it develops itself, and in making improvements which suggest themselves as the work goes on, that our predecessors had two hundred years ago. The designs made by Sir Christopher Wren for St. Paul's Cathedral underwent great changes during the progress of the building, as there are many extant working drawings to show. Some liberty, of course, we have by the usual conditions of contract, but the greater rapidity of modern construction, and the fear of additional cost to the employer, limit considerably the free use of those conditions; and this want of elasticity, so to speak, in availing ourselves of opportunities offered by the study of our works whilst in progress, is one of the points on which the older architects had a great advantage over us. Let us now compare the works of some of the older with those of more recent architects. But before doing so I would urge upon those in whose hands rests the power of developing the means of architectural study to consider the possibility of forming a permanent exhibition of drawings representative of English architecture. The suggestion, indeed, is not new, nor is it mine; but I have received a letter on the subject from our Fellow, Mr. W. Howard Seth-Smith, which is so much to the point that I propose to read a portion of it. He says:—

> If we are to look for real and permanent progress in architectural design we must in some way create public interest and enthusiasm for beautiful building. A permanent exhibition would be the very best means of gaining public interest in our art. It is the Galleries which have made art more popular. It may be true that the public do not understand geometrical drawings such as are annually exhibited for three months in one small room at Burlington House, but there is a very considerable and increasing number of persons sufficiently interested in architecture to appreciate keenly, and to compare critically, the merits of buildings if represented by photographs and other perspective views. It is on the face of it unfair to subject an exhibition of architectural designs (largely geometrical) to competition with a mass of popular pictures, as is the case at the Royal Academy; but this is the only opportunity existing in London for a person to watch the progress of English architecture. While the amateur's opportunities are confined to the ancient buildings themselves, his prejudice against all modern work is likely to be as invincible as it is unreasonable, and therefore fatal to progress. Nor is he, as a rule, capable of studying modern work profitably by perambulating the streets; his knowledge will be too small to enable him to distinguish the good from the bad. The choice specimens (alone worth the attention of the student) are, with few exceptions, scattered too widely or hidden too deeply amid this utilitarian wilderness of London to make this practicable. I would propose that a permanent exhibition be organised of most carefully chosen architectural illustrations of the best ancient and modern designs, classified under all the great divisions of building, such as Civil, Ecclesiastical, Domestic, Scholastic, &c. There should be one department for photographs of selected ancient work, chronologically and topographically arranged and carefully described. This would supply the urgent and often-expressed want of an illustrated lesson on the characteristics and developments of the great architectural epochs and styles of the past. Such an exhibition would at once be popular among the rapidly extending connoisseurs of art, would be patronised by persons of enterprise and intelligence desiring to build, and would doubtless be largely visited by Americans and other foreigners.

I certainly consider Mr. Seth-Smith's proposal one of great importance. To be of any service it would require to be carried out in an effective manner, and if this could be done, it could not fail to be advantageous both to our profession and the public at large. Returning to my proposition before stated, the list of the architects I propose to refer to begins with the two greatest names on our record—namely, Inigo Jones and Sir Christopher Wren. Inigo Jones had settled at Copenhagen, and the King of Denmark's sister, who married our James I., brought him back to his native country. He then travelled for further study in Italy. The beautiful fragment at Whitehall is, as you know, only a small portion of the magnificent palace which he designed for King James, preserved to us, no doubt by the liberality of Lord Burlington, in Kent's fine edition of Inigo Jones's works. Besides the Banqueting House, there are but comparatively few remains of Inigo Jones's buildings in London. We have lately lost a very interesting work of his in Lord Shaftesbury's house in Aldersgate-street, which was taken down about ten years ago. It had already suffered much, but was still a noble fragment. There is also the much-mutilated east front of St. Paul's, Covent Garden, and the Piazza on the north side of the market; and there is the water-gate at the bottom of Buckingham-street. This gate, although it retains its beautiful proportions, has lost much of its interest now that it no longer gives access to the river; but its preservation under any circumstances is a thing to be grateful for. A house on the west side of Lincoln's Inn-fields still shows the handiwork of Inigo Jones. Ashburnham House, Little Dean's-yard, Westminster, built by him, has been much altered, but there are remains of his work in the interior. There are probably a few others, but a good deal has been attributed to him on insufficient grounds. Sir Christopher Wren's first work of any importance was the Sheldonian Theatre, Oxford, designed by him in 1664—a building which still admirably answers the purpose for which it was constructed. At this time Wren was busied with various designs for altering old St. Paul's, which had survived in a very ruinous condition the ill-treatment of the 16th century and of the Commonwealth. The Great Fire in 1666 put an end to all attempts to repair and alter it, and made a new building necessary. I am not intending to dilate upon the existing Cathedral, which you all know so well, and in which there is so much to admire; but I should like to call your attention to a design which is even more distinctly Wren's than the existing Cathedral. I refer to his first and favourite design, for which an elaborate and large scale model was prepared. This model still remains, though, unhappily, it suffered from neglect during many years, and I am glad to be able to inform you that it is undergoing restoration, though progress is necessarily slow. It is, however, in quite a sufficient state of preservation to enable Sir Christopher Wren's merit to be fully appreciated. We have at this Institute, by Mr. Goodchild's kindness, two splendid drawings representing the interior of the Cathedral as it would have been if Wren had been allowed to execute this design. I do not say that it competes on equal terms externally with the existing structure, especially when we consider the height of the surrounding buildings, which gives the value of greater loftiness to the adopted design. But when we consider the two interiors, the balance altogether preponderates in preference of Wren's favourite design. As for certain defects in it which Fergusson discusses, we must remember that Wren had not, in the case of this design, as he had in the adopted one, thirty years of study and improvement to give to it as the work proceeded; but this marvellous production was the outcome of necessarily a very rapid incubation. The late Rev. J. L. Petit, in discussing Saint-Front, Périgueux, and what has been and still might be derived from it, observes that Wren—who, though he may not have known Saint-Front, must have known St. Mark's, Venice, from which Saint-Front was derived—"had conceived a design" (namely, his favourite model) "on similar principles, which, "had it been carried out, would have given his cathedral the noblest interior in the world." It is evident that Sir Christopher Wren's designs embodied the result of much study and many approximating revisions in preliminary sketches, carrying out in this the precept of Horace, "Sæpe stylum vertas," which may be familiarly translated "Use your india-rubber freely"; and when the final result was attained we find that he considered rhythmical proportions as essential to completeness in architectural design as they are to poetry. I find the same thing in the two buildings of Sir Christopher's I have chiefly studied—namely, St. Paul's Cathedral and St. Stephen's, Walbrook—and I have no doubt it obtains also in his lovely creations of Bow Steeple, St. Vedast, St. Martin's, Ludgate, and others of his works, which possess admirable qualities of elegance combined with simplicity. The most conspicuous of Wren's followers were his pupil and assistant, Nicholas Hawksmoor, and Vanbrugh and Gibbs, to whom may be added, as an associate, Dean Aldrich, who built the church of All Saints, Oxford, and the Peckwater Court of Christ Church, in a style much in harmony with that of his friend, Sir Christopher Wren. The three first named have left stately monuments. To mention only one work of each: Hawksmoor has given us, in his church of St. George, Bloomsbury, a monument worthy of the Classical feeling he had imbibed from his master; James Gibbs, in his church of St. Mary-le-Strand, a work of great elegance; and Vanbrugh at Castle Howard, a noble pile, more pure than Blenheim. Vanbrugh, however, failed to impart—as Wren did—sufficient elegance to his powerful masses. The above-named architects represent in date the middle of the 17th and the dawn of the 18th century, and they are the authors of standard works with which it is hard for the modern schools to compete. The middle and end of the 18th century witnessed performances, many of which were not wanting in dignity; but they offer a less uphill match to our own time. We must, of course, accept a common ground of comparison; for Gothic architecture was almost unknown in the 18th century, though an exception to this statement ought to be made in the case of the architect Essex. Limiting the inquiry, therefore, to the revived Classical styles, the names of Lord Burlington and his friend Kent, and Kent's pupils, Flitcroft and Vardi—the latter the builder of Spenser House, in the Green Park—the younger Dance, Sir William Chambers, and James Gandon, the architect to the Four Courts in Dublin, and distinguished as being the first to receive the architectural gold medal of the Royal Academy, stand out pre-eminently. There are a simplicity and fitness for the purpose about Dance's principal works, Newgate and St. Luke's Hospital, which are worthy of being carefully noted. Sir William Chambers's great work, Somerset House, notwithstanding many effective new buildings on the Embankment, maintains its pre-eminence, and the Strand front and entrance may still be said to "hold the record" of similar combinations. A little later in the century lived Wood, the architect of Bath, whose palatial building of Prior Park is one of the ornaments of the 18th century; and James Wyatt, a man of versatile genius, and Robert Adam have left works of merit. At the turn of the century came Sir John Soane, whose most remarkable design, the Bank of England, has the merit of being thoroughly characteristic of the purpose of the building, following in this the spirit of his master, the younger Dance. When we come down to more recent times, by which I mean the first quarter of the present century, I find among the names of the architects some whom I myself remember when I settled in London as a pupil to Edward Blore in 1836. One of my first memories was the exhibition of the designs for the new Parliament Houses. They were exhibited in the rooms in Trafalgar-square, which had only lately been completed, and had not yet been assigned to the Royal Academy, whose exhibition for that year was still held at Somerset House. Sir Charles Barry's design was approached by no rival. Some drawings were indeed sent in by Cockerell, but he had evidently not entered seriously into the struggle. Blore did not compete. So far as my judgment at that time can be trusted, the best of the unsuccessful designs was by Basevi. Besides the four just mentioned, the names I recall as the leading London architects were Samuel Angell, Tite, Hardwicke, Sydney Smirke, Donaldson, Salvin; and, as a writer, Gwilt. For Sir John Soane, Sir Robert Smirke, Wilkins, Inwood, and Decimus Burton, though living, belonged to an earlier decade; Thomas Henry Wyatt, Sir George Gilbert Scott, and Sir James Pennethorne had scarcely at that time made their mark; and William Burn was just migrating to London from Scotland. I omit Augustus Welby Northmore Pugin, who, as far as the competition for the Parliament Houses was concerned, was, as it was already known, giving his assistance to Barry. At the time to which I refer, I consider that, with the exception of Pugin, Blore was the only architect who was quite at home in the detail of Gothic architecture. The full development of the Revival had not come in, and it was the "day of small things"; but whilst we may reasonably complain of a want of massiveness for the most part in his works, there is a sense of elegance about his buildings which raises them above the level of the majority of the contemporary works of Gothic revival. There are not many of his buildings in London. The exterior of the Church of St. Thomas Charterhouse, in Goswell-road, may be cited as a good specimen, allowance being made for the decay of the Bath stone used in the decorative parts, the inability of which material to resist the London atmosphere was not so fully recognised then as it has been since. Among the best buildings of the same period are two works by Shaw—the hall of Christ's Hospital and the tower of St. Dunstan's-in-the-West; fortunately a better stone was used in their construction. The first place in the period which I am considering—for I purposely do not refer to the names of men who, like William Burges and George Edmund Street, attained such distinction during the second half of this century—must be assigned to Sir Charles Barry, not only on account of his great work, the Parliament Houses, in which, whatever amount of freedom in detail he may have allowed to his coadjutor Pugin, his great power of dealing with the masses was conspicuously his own. But independently of this, the Reform and Travellers' Clubs, and Bridgwater House, to mention no other of his works, suffice to secure him this position. Barry was a man of extraordinary energy, of unwearied industry, and of a powerful presence, qualities of the utmost importance to anyone engaged in works of such a scale as those which were intrusted to him, especially when combined with a courteous manner, of which I personally had the highest appreciation when he was on the committee assisting Dean Milman in the works intended for the completion of St. Paul's Cathedral. The man of greatest distinction after Sir Charles Barry was unquestionably Professor Cockerell, a name deservedly revered and honoured, whose buildings include some of very great merit. Cockerell laid the foundation of the Classical expression found in his works by an exhaustive study of Greek remains, of which he was an eminent and ardent explorer in days when such investigations were rare, and attended often with "perils from waters" and with "perils from robbers," in days when communications were very difficult. His fame would be considerable if it rested only on his published works. When he returned to England he entered heartily into the then fashionable Greek revival; and, so far as it was possible to adapt the limited range, not of its teaching, but of its available precedents, to modern practice, he succeeded—a claim which can be made for no other architect of our time but one, Schinkel, of Berlin. Cockerell excelled as a draughtsman, and was no mean sculptor. He himself modelled much of the ornament which he introduced into his works, and his mouldings are always examples of appropriate profile. These details, and the propriety of their subordination to the whole, in addition to the sense of harmony and proportion which prevails throughout, are objects particularly worthy of study in his works. In London, the Sun Fire Office near the Bank of England, and at Oxford the Taylor Museum, are buildings which will preserve his reputation as an architect. His admirable lectures delivered at the Royal Academy cannot but have produced good results on those who heard them. Both in Cockerell's works and in those of Barry will be found the same qualities of proportion and subordination of ornament which are conspicuous in the works of Sir Christopher Wren and architects of his school. Nearly contemporary with Cockerell as a Greek explorer was Donaldson, the chief pillar of the Institute at its commencement. There is not much of executed building by him, but he was an admirable instructor; and many of our present members owe much to him from his lectures at University College. He, too, has left a long-enduring memory of a kind and sympathising nature; and, while mentioning Donaldson, I cannot but refer to the three Papworths, father and sons, the last of whom has been borne to his grave since we met in this room. To continue: Gandy Deering, himself a Greek explorer, having been engaged in that service by the Society of Dilettanti, exhibited much skill in his use of Greek elements; but for the most part the Greek revival did not, and could not, succeed, and it helped to bring on the Gothic revival, which apparently is also losing its vitality. Some good works, in which Greek detail is not so evident, were, however, produced about the same time, such as Arthur's Club-house, and Basevi's Fitzwilliam Museum at Cambridge—the latter being left unfinished when Basevi met his death by a sad accident in Ely Cathedral. The building was then completed by Cockerell, but the interior has been much altered since those days. The most remarkable building of this period (if we exclude the Houses of Parliament, the style of which does not lend itself to the comparison) is St. George's Hall, Liverpool. The younger Elmes, who was the architect, did not live to finish the building, and after some delay Cockerell was appointed to complete the work. It appears that Elmes had left full instructions for its completion, but these documents had been lost or mislaid, so that when Cockerell came upon the work he had nothing to guide him but the shell of the building. The entire finishings as executed are by Cockerell's hand; but there can be no doubt that in every respect he loyally carried out Elmes's intentions so far as they could be gathered, and the harmonious result shows that he must have succeeded in practically doing so. The external approaches to the hall were worked out and finished with great care by Cockerell; these, however, have been since subjected to considerable alteration by others. I have now carried the summary far enough, and shall not particularise any very recent buildings; and for the purpose in view—that is, the comparison of what was done in the 17th and 18th centuries with the works of the present time—there is no necessity for my doing so. Carried down to the extent it has been, we have found in Sir Charles Barry's and Professor Cockerell's works the same loyalty to the principles of subordination and proportion that prevailed in the days of Inigo Jones and Wren. But, latterly, they seem to have been too much lost sight of. Both the Greek and Gothic revivals have had the effect of bringing into contempt the precedents of Palladio and the great Italian authorities, and, misinterpreted as the spirit of their rules often was, there was some reason in this reaction, for, as far as such rules were supposed to supply the place of genius and thought, they were indeed fetters instead of helpers. That genius and thought could be replaced by rules of any kind was certainly a mistaken view. Followed as Palladian precedents and principles were by men like Inigo Jones, Wren, and Chambers, as the language with which their thoughts were to be clothed, they had the same value in architecture that metre has in poetry. The license which is now too frequently taken with forms and features long recognised as essential, in favour of a treatment of which the final aim is picturesqueness, can hardly ever produce a satisfactory effect from all points of view. I do not hesitate, however, to allow that pleasing effects do, as it were, accidentally occur; and that we do not, in streets where architects have scope allowed them, see monotonous frontages of the class of Gower-street and Wimpole-street—such as were general at the beginning of the century, though even to them some excuse must be granted. Those were hard times, when the country was struggling in a great war for very life, and severe economy in building was then much more insisted upon than it has been of late; and had that restriction not happily been relieved, there could not have been employment for more than about one-tenth of the number who are at present enrolled in the profession. The relaxation of architectural discipline, however, was not a necessary element in the result referred to, for quite sufficient variety, and of a better quality, can be obtained by proper study without ignoring accepted precedents, or neglecting principles of still greater value—namely, proportional relations of contiguous parts and subordination of details to the purposes for which they serve and to the general effect.

At the close of the address a cordial vote of thanks was passed to the President, on the motion of Dr. GREGORY, Dean of St. Paul's, seconded by Mr. L. ALMA-TADEMA, R.A.

STAINED GLASS.*

THE subject is perhaps too wide, and has too many ramifications, to allow of justice being done to it in the course of a short paper; therefore I propose to limit my remarks to its relation with architectural features, and to the description of the inception and execution of a modern window, referring, from time to time, to examples on the walls which seem to me as bearing somewhat upon the particular point under discussion. It is most probable that the greater part of matter of this paper will be already well known to most of you, so I must address myself to the younger and least experienced portion of my hearers. Ignorance of the methods of the glass-painter is so common, that possibly I may be able to remove some misconceptions, and throw some light upon what, to gentlemen in your profession, must be an interesting subject. Ignorance is the wall against which glass-painters are so often bruised and broken. Ignorance of the origin, limits, methods, and subjects of the art on the part of clients is the great cause of the prevailing pictorial attempts—attempts which, in the nature of things, must fail. For our purpose to-night I will suppose that a possible client has asked for a preparation of a design. Theoretically, therefore, it is necessary for the painter to ask himself some questions before commencing. First, what is the purpose of a window filled with painted glass? Indubitably, to give light, and at the same time to hang, as it were, between earth and heaven, representations, in brilliant colours, of men or incidents in the life of the Christ militant, expectant, or triumphant, for the education and consideration of the living, and to form a worthy adornment to what should be a worthy Palace of God. The question of light puts out of court entirely those heavily-painted and coloured windows of German origin so frequently seen in our churches, and which at one time we considered the acme of good taste. Whatever else may be, the glass must admit light; this was felt in the first period of the revival of the art, and thin glass was used with this object in view. A little study of many remaining examples of old glass in England—and it is quite unnecessary to go further—such as York, Malvern, Fairford, Oxford, and elsewhere, would have shown that most obvious fact, that the object was attained by using white glass, for certainly the greater portion in all old works—perhaps two-thirds—was white, or white glass stained yellow. Our immediate predecessors made windows of thin coloured glass, with here and there a little white; now, in the light of fuller knowledge, we make windows of white glass, with here and there little pieces of colour. Here, if I may digress for a moment, I may say that the tardiness of the revival in recognising the true principles of the art is to be charged against the architects of the time: they neither understood themselves or encouraged others to learn the true path to walk in, but intrusted glorious buildings—the heritage of the past—into the hands of men who chose, for purposes of commerce, to call themselves glass-painters—men who were mere shopkeepers, who bought and sold the untrained labours of others, and who founded that school of art which has but to be named to be condemned—viz., "the so-much-a-foot school." I will quote from the catalogue of one of these manufacturers:—"Single figures, 25s. per square foot; groups and scenes, 35s. per foot; Calvary groups and angels, 50s. per foot." What ignorance! Another firm have descended a step lower even. I quote again:—"If without borders on edge, 2d. per foot less." How are the mighty fallen! That reasonable people should expect that art, a delicate flower at all times, could possibly flourish under such auspices, passes human knowledge; but they did, and some do. To return. We have now fully decided that the window must be light. The next question applies to the stonework: Is the stonework to be ignored by the painter, or is it to be looked upon as one of the main factors, and the glass treated as an embellishment of deliberately designed tracery? This question is one which is self-answering, for no architect would spend time, thought, and trouble on designing stonework only to ignore it when the glass painter appears on the scene; but, in result, look around you, and you will find window after window, many with the full approval of the architect, with a picture running through all the lights, the mullions being simply necessary evils and making blots on the work. In one church of my acquaintance a magnificently-designed seven-light window, with elaborate and beautiful tracery, is filled, with one picture of the scene of the Crucifixion, trees, and sky, ascending from the lights through the tracery to the very point—all the stonework, which was the fruit of much thought from an artistic mind, treated as non-existent, or, at most, as a sort of screen, standing in front of the picture, having no sort of a connection with it, through which the window is viewed, instead of being a most beautiful setting for and a blending of a series of separate works. No matter how skilful the painter be, one of the fundamental conditions of his art has been neglected, and failure, to an extent, must result. If it be insisted upon by the donor that one subject only be depicted, it is sometimes possible to overcome the difficulty by using a series of single figures. Say "The Crucifixion" is chosen—a very usual subject. The crucifix in the centre light, with the B.V.M. and St. John in the side lights; or, if five lights, St. Mary Magdalen and the Centurion, or Joseph of Arimathæa, might be added. An example of this may be seen on the walls—viz., the east window at St. Cuthbert's, Blyth. This mode conveys all the teaching of a picture without departing at all from the canons of art, and remaining, as stained glass always should, a decoration. Where a picture under canopies running through all the lights is insisted upon, the artist must comply, for he is but human and wants to live, but he cannot make a satisfactory work. He can, however, if skilful, break up his composition into groups, each complete in its own light, with none of the figures cut by the mullions. This has been done with some success in our two windows at Manchester Cathedral; but, in all cases, the tracery openings are so distinctly treated as to bring out, rather than obscure, the forms which the architects took so much trouble to set out. The next thing to be considered is legibility. It is a very common occurrence that windows fulfilling all other conditions dismally fail in this respect. How many of us can call to mind instances in which we have puzzled ourselves what it was all about. This is not as it should be. No glass should be so reticent as to be practically dumb, though a certain modesty of utterance is desirable; for, clearly, if it be worth anything at all, the painter must have spent time and thought upon it, and all his ideas cannot be given up at a glance of the casual observer. As an illustration of my meaning, take the Newcastle Cathedral window, which can be examined on the walls. There are four lights with two subjects in each. In the first, Our Lord looking over Jerusalem, pronounces the woes against it, and in the smaller space beneath is figured the destruction of the doomed city. In the second light, Christ scatters the money changers in the Temple; under it is the judgment of Achan. The third light contains a representation of the Son of Man denouncing the Scribes and Pharisees, with the barren fig tree in the lower panel. The fourth shows Him prophesying the demolition of the Temple, and in the base the worship of the Lamb in the Temple, made without hands in the Heavenly Jerusalem. All the larger spaces are incidents from the life of Our Lord during Holy Week, and all the smaller types, or ante-types, and are interesting as such; but they are interpreted, or, as it may be better said, they receive a keynote from the angel in the head of the tracery, blowing a trumpet and bearing a scroll with the text, "The hour of his judgment has come." This is called a "judgment" window, and though all the panels tell their own story simply enough, there is enough left to retain interest for succeeding visits. Having now formulated and fixed the unalterable bases upon which the painter must found his work, we come to other and somewhat less important details, in which individual taste and manner have a right to assert themselves. We have just to choose a style, and for our purpose we will suppose the shape of the window to be Gothic of some form. Now, shall the period of the stonework showing itself by the lancet or cusp-shaped heads determine the manner of glass to be inserted? Perhaps at first sight the answer seems naturally to be "Yes." If we look at the subject all round we shall come to the conclusion that at least there should be liberty. For myself, I should be inclined to go further than that. All glass painters are told to study the existing works of Early and Mediæval artists. Why? Is it that we may imitate and slavishly follow what was done at any given period, or is it to educate our tastes by following the art from its beginning to decadence? Learn what to avoid as well as what to use. Take the glass at Canterbury. The first impression is blueness. This, in a cold country like ours, seems a mistake—its opposite would be more appropriate. Perhaps our next feeling is weight and opacity. Climate considerations argue strongly against these points. Our next feeling is wonder. What is it all about? At comparatively close quarters the whole is a kaleidoscope, with here and there a salient point which is readable, such as a crucifix. On close examination, however, this fault disappears; but another becomes painfully apparent—it is the shockingly bad drawing. Given, then, a window of the same shape, are we to fill it in the same manner or not? I say unhesitatingly, No. Why, then, did we study these works? Was our time wasted? Certainly not. We can give these windows unlimited praise. If we consider that they were executed at a time when people were only beginning to draw, when their knowledge of chemistry was so limited that only a very small palette of colours was theirs to choose from, when we think how the figures were cut by means of a hot iron, which, of course, gave them shapes only approximate to their desires—all this we may admire, but not imitate. We have learned to be very careful of our use of blue, to admit more light, to choose our subjects on a larger scale, and to put good drawing into them. Are these lessons useless? I think not. Canterbury is quoted as a very conspicuous example; but nearly all early glass conveys the same moral. The fact is, the art of glass-painting had an infancy, adolescence, a maturity, and a decay, and we should, I think, adopt that period in which the art was at the highest stage of development. There is, of course, still another method of treatment which has lately arisen—viz., to imitate Sir E. Burne-Jones, and not worry ourselvesat all as to what has gone before, but express our own feelings in our own, or rather his, way, and thus form a new school. This I will return to later. In the supposed window before us, the style decided upon is to be Perpendicular, regardless of its actual shape, and doing in our own time, but with fuller knowledge, what the men of the 15th century would have done. These men did not consider that an Early church should have only Early fittings; but continually pulled down parts and re-erected others, added to, inserted, or otherwise altered features already existing, but in their own way. We now come to actual details, and have to decide whether the windows shall depict subjects, each subject filling out the stonework or with canopy and base, or whether a single figure and tabernacle work for each light, or other method would be best. Here one of our postulants applies. The window must tell a story—this is insisted on; but other considerations have weight. The height from the floor and the treatment of neighbouring glass, the traditions of the district, and other matters have to be thought out. Generally, it may be said that on a low level a subject, an actual incident, seems most suitable, and is most generally appreciated; whilst on higher planes single figures in canopied niches tell out best. If the window be large enough, figures in the upper portion of each light and a small picture below, illustrating some incident of interest in the life of the saint over it, make a very instructive and effective window. As a case in point, I may mention our design for the west window of St. Mary's, Crumpsall. As in our opinion, therefore, the figure of the saint with his emblems is as full of teaching as a scene from his life, at least to educated eyes, and gives greater opportunity for display of skill and technique, the window upon which we are engaged shall contain three single figures, but of what size and how shall we fill the surroundings? Generally all figures for an ordinary parish church, whether painted on the walls or in windows, should be kept on the small side, say 3ft. to 3ft. 6in. in height, for this reason—the human figure is the natural scale by which men unconsciously measure a building. The whole window by this means looks more important, and the building itself is aggrandised. Again, as most of the colour to be used in the work must be concentrated on or near the figure, and as, of course, colour absorbs many more rays of light than white glass, for this reason, too, should the figure be kept as small as possible. This, of course, is not a rigid rule, but subject to various qualifications—as size, height, and style of building. We will suppose, if you please, the lights of our windows be 7ft. 6in. by 2ft. 6in.—a common measurement; our figures, therefore, should be 2ft. 9in. high. This may seem a somewhat startling disproportion between figures and ornament; but if the window is to light the church at all, somewhat about this proportion must obtain. We have now to lay out the space between the figures, the actual point of interest, and the stone mullion, and for our choice we have the Early archaic canopies, diapered quarries, screens, and the tabernacle work of the 14th and 15th centuries. The latter, from an artistic point of view, has a strong preference; the many cusps, pinnacles, and crockets of this style give, when freely treated by the hands of the capable man, a delightful crispness and sparkle—surely great desiderata, which are quite impossible in earlier styles. Against this an eminent Manchester architect, recently retired from practice, condemns the 15th-century canopies on account of some necessary perspective, which from some points of view must be false, and says that once allow this, and nothing can logically prevent us dropping into the vagaries of Louis XIV. This is a staggering position to assume, for if glass-painting is to be anything but the various flat-line ornament, eyes, nose, mouth, and limbs must be treated perspectively to bear any resemblance to the human form, and equally the perspective must be wrong from some points. Passing by such criticism, I shall adopt canopy work and the Perpendicular period at that. For optical reasons the canopy should err on the side of height, as all objects seen above the line of sight have a tendency to become dwarfed. This illusion must be borne in mind throughout the work, with reference to the proportion of the figure and other parts. Eight heads is usually considered the normal height for a man; but at considerable distance above the line of sight ten heads is not too much to convey a just idea. We have 4ft. 9in. of space to be divided between canopy and base, and will apportion 3ft. to top and 1ft. 9in. to bottom, and as the lights are 2ft. wide I shall adopt wide shaftings of 4in. on each side, these shafts to be pierced by openings and broken by niches filled with small figures, illustrating persons having some connection with the central figures. This will carry the interest into what to layman would be mere architecture, and give apparent value to what they think the cheaper portion of the work. We come now to the figures themselves, and must take a definite line as to the kind of drawing to adopt, whether the pretty-pretty of the ladies' boarding schools which looks for smiling, amiable faces, and nothing else, the arts and crafts method, or the most robust style, Gothic Renaissance. Among architects I will say nothing as to the first, beyond mentioning the fact that, when a client deals directly with the artist, as, I am sorry to say, many do, this is what they require in most cases, and the heresy is very difficult to eradicate. To pass to the arts and crafts school, this is not to be dismissed with a word, for it has evidently come to stay, and is making itself felt in all directions, whether in fine or applied art. It depends for its existence on form and on grace of line, and does not seem to me to concern itself at all with such details as light, brilliancy, and colour. It draws the whole with the leads, not only the outlines as in ancient works, but in every detail—it says, in effect leads are a necessity! Granted! "Then use plenty of them." To such an extent has this been carried that windows may be heard of which have no colour at all, the forms being drawn with the leads, crosshatched with the leads, and only the nose, eyes, and mouth being painted in black, all the glass white The effect is a sketch in black and white. Sometimes, on the other hand, colour is the "be all" and "end all" of the work. Witness the windows at Birmingham and Torquay; there it is wonderful and compels admiration from the most reluctant; but I often wonder how people can educate themselves to worship, as some do, the mysterious beauties of sensual pouting lips, protruding chins, long necks, each with a wen on it, and the lean, miserable looking figures generally, which are the distinguishing characters of the school. However, when all is said for and against, these men have struck out a line for themselves, and in this age of mediocrity that is something indeed. For myself I cannot bring myself to draw such peculiar stuff, and shall, therefore, look to the study of Albert Dürer, Memling, Schongauer, and Bergmeier to help me as to the manner in which I shall depict my saints. There is no difficulty in finding quantities of their work, and the authorities of the museums and galleries are courtesy itself, and give every facility for their study. We find a squareness of form and a strength of line which, by their sturdiness, are so thoroughly in accord with the English character. The preliminary details being now settled, to the satisfaction of the artist at least, we take the architect's form on tracing paper, and make another on drawing paper on a somewhat larger scale, and commence our work by putting in the canopies and bases. The figures are now laid in, always having regard to the limitations of the medium, only certain colours being admissible, the background or filling between the figure and tabernacle work being made as small and broken as possible. With a skilful man this design can be carried out exactly, and should look glassy and convey the effect of the window itself to the eye. All these things, however, are mere preliminaries; but when the design is accepted the real work begins. Before this is done, however, the architect is usually consulted, and just now we have been told by Mr. Richmond at the Church Congress that this is the very last step of wickedness. What business has the architect to suggest colours or forms, or even dare to criticise in any shape what he knows nothing about? We must do away with the middleman and the tradesman architect, and go to the only person who knows anything about it —Mr. Richmond. No connection with any other establishment. Truly we live in an age of claptrap. This very person, who will have no middleman, architect, or otherwise, employs a firm to do his windows. Mr. Richmond does not execute them with his own fingers, nor does the head of the employed firm; but employed glass painters and employed mosaicists, whose names the public never know. Let us admire this consistency; to me the whole business savours of cant. Who should know, if the architect does not, what is or is not suitable to the building? And, in my opinion, the chief cause of the bad effect of most church decoration art is the want of harmony with the fabric, resulting from the clergy going direct to the decorator, rather than through a trained and capable adviser, who could carry all work through in one key. No! No! Mr. Richmond, we want the architect; we shall require the tradesman when the principals of stained glass firms design, draw, and paint themselves, only employing assistants to assist, and not as now—viz., one so-called assistant designs the window, another draws it, and a third paints it, while the choice of glass is left to an inartistic cutter. Then, and then only, will stained glass become as it once was, an art. To this fact, and to this alone, do I attribute the phenomenal success which has attended the efforts of my brothers and myself. Three years ago, utterly unknown to a single architect or other person of influence in the art world, except the firms to whom we had acted as ghosts, we began to work over our own signature. In those three years we have designed, drawn, and partly painted with our own fingers, 410 different windows. Such is not quoted as an advertisement, though we are only human, but as the effect of the system adopted. There is a great future for any man who, by sufficient study, time, ability, and knowledge of technique, qualifies himself to be a real stained-glass artist. After this digression we will return to our window, and proceed to draw on paper the full size and forms the ornamental portion is to take, introducing, wherever possible, round bulbous shapes like pearls, which, when transferred to the glass, will each become a point of light and sparkle; the lines shown on paper will be the exact thickness desired for the traced lines in the glass. The bars are now set out, that no salient point of the picture may be obscured, and these bars themselves must be so arranged as to give strength to the glass and to the design, for they are one of the limitations of the art. The figures are now drawn in, either in charcoal, bistre, or colour, as the artist may fancy. The faces are made full of character, and without making facial beauty the chiefest consideration, yet there can be no use in ugliness for its own sake. In general pose, the saint should be firm on his feet, and look as though built into the niche. The emblems well thought out—a key, a chain, or a rack can each in its own way be artistic without ceasing to attain its own special attributes, and they should generally be in larger proportion than the figure, as upon them as much as on their bearer will depend the interpretation and interest to the beholder. The drapery will be in square forms, with plenty of sharp points where the glass will be picked out and freed from paint for the sake of brilliancy, and will be broken as much as conceivable by turns and kinks, revealing linings under dresses, and other details of various tones and colours, no large masses being generally pleasant to the eye. Great care must be taken to secure accuracy of form in vestments and other ecclesiastical ornaments. The parts to be stained yellow are indicated with gamboge, and diapers suggested where needed. I think it may be said that a window depends for its effect upon its sparkle and elaboration; therefore borders of pearls and black diapers are lavishly suggested, as by their means this end is best obtained. The first stage is now ended, and nothing remains before starting work but the sanction of the architect. This being obtained, the linen and form of cutting lines must first occupy our attention. It looks uninteresting enough, except as a sort of children's puzzle; all the same, it is very important. Here the shapes of various pieces of glass have to be drawn, and the glass itself chosen, and each space numbered to correspond with a sheet of coloured glass in the bin. The colours we have to deal with are somewhat limited, as most of the tints used by picture-painters look poor and thin in the glass. Roughly, we have red, blue, green, and white, with nitrate of silver as auxiliary, and very useful it is; by it white is converted to all possible tints of yellow, from the palest lemon to the strongest burnt Sienna tones; blue becomes green, and red appears in more golden tones. Another item to the glass-painter's palette more than compensates him for the loss of many shades. Sunlight itself is pressed into his service, and while picture painters imitate sparkle, he has it, and if wise, uses it. By judicious choice of various sheets of glass which differ greatly, and by little tricks, such as staining and plating, a sufficient variety is obtained. Staining is done with the silver, and plating by superimposing a piece of glass in one colour over another. For instance, purple is often obtained by plating ruby over blue. Having now prepared for the cutter the outlines he is to cut by, and numbered every space throughout the window, the master mind steps aside and leaves the workman the use of his experience and skill. He will so pick the glass of any given number that the dark portions shall be where shadow is desired, and *vice versâ*. Sometimes he is able by careful selection to obviate the necessity of painting to any extent; this is specially so with ruby glass, which, being of an opaque nature, is seen to a much better advantage with as little pigment upon it as possible. As the cutter finishes each piece, he places it in a tray and ticks off the corresponding space on the linen form. When all are complete, they are handed to the tracers, who take each piece separately and lay it on the cartoon or working drawing, in the exact position it will occupy when complete, and carefully, but with the freedom born of knowledge, trace the main lines upon the glass, which he can see upon the paper beneath, with a pigment composed of various earths, which will vitrefy when exposed to heat. This colour is mixed with various pigments, such as gum, tar, &c., in order that they may be worked in successive layers, without disturbing the coat underneath. These media all dry out and disappear in the fire. The tracer next proceeds to lay in the deepest shadows by means of a broader brush, always following the cartoon, and then hands the whole thing to the painter proper. He spreads the linen form face up on a table, and over that a sheet of plate glass. On this latter he sorts out and places in position all the glass; when the seeming puzzle is all worked out and all pieces are *in situ*; a margin of about $\frac{1}{8}$in. surrounds each one, the space the leads will presently occupy. Hot wax is poured between the pieces to secure them to the plate glass with the mosaic upon. It is raised upon an easel against the light, and what is technically called matt or film of colour is brushed over the whole, and while still wet is stippled very coarsely. Upon this stippling the future brilliancy of the glass depends. Until lately it was, if done at all, done after the colour was dry. This took off all the pigment in certain places, and gave a hard and dry effect to the glass, and too fine a brush was used for the purpose, weakening the result considerably. It looks now but a huge dark smudge; but with the eye close against it the traced lines are still discernible. When dry, the painter, with the cartoon in front of him for guidance, by means of hog-hair brushes, needles, bits of wood, quill pens, and other odds and ends (never was there good work completed with such cheap and common tools), proceeds to pick out, scrub off, and rub down, or otherwise dispose of the superfluous pigment; he is really engraving on a soft surface. This is probably the reverse of the idea in the minds of most. To put the matter succinctly, it is not painted by means of adding shadows to a light surface, but by brushing out lights from a dark surface. When all this is done to the best of the workman's ability, the master workman takes it in hand, going carefully over all, darkening here, lightening there, correcting a bad line, and generally, to use a stock phrase, giving it "artistic merit." The painting pure and simple is now complete, and all the pieces are taken off the easel-glass and handed over to the stainer. He has ground his silver-nitrate with a medium, generally lake, and anoints the back of the glass with the mixture in varying consistency. The man with the diaper has now to take his turn. He has a collection of patterns, accumulated as a result of personal trouble and research on the part of his employers. I have with me some of these, and should like you to look at them presently. I am quite safe in saying there is not such another collection in England. These diapers are all numbered, and are drawn each in many sizes; all the painter has to do is to copy one of these on the obverse of the glass, if the pattern is meant to be clear and sharp, or upon the reverse side if a blurred outline is wanted. These diapers, especially black on white or yellow, by partially obscuring portions of the glass, give great contrast and force to the remainder, and secure the well wrought elaboration so conspicuous in old glass. Nothing remains now but to place the whole on iron trays and slide them into the oven, which is heated until the painted surface fuses. This process requires very careful watching, for if sufficient heat is not given, a short space of time is enough to show the paint going from the window, to the disappointment of all concerned; or if too much heat plays upon it, the paint fires away, and the work must be done again. The cooling is very risky, and some disaster is pretty sure of occurrence, necessitating repainting some portions. When all is cool, the linen form comes out again, and is spread upon the glazier's bench, and the pieces again find their place in the puzzle, and this time finally. Grooved leads are placed between each, and a smart tap of the hammer knocks it firm. All the joints of the lead must now be soldered, and cement must be rubbed into the grooves to give rigidity, and to make all weather-proof, and our window is ready for its permanent home. I trust this short description may induce the younger portion of my hearers to reconsider any notions they have entertained as to the high price of stained glass. A picture-painter has but his colours and canvas to pay for, while the glass-painter has glass, lead, cutting, cementing, and glazing; and to add to these bills for materials, and very heavy items they are—all demands much more care and attention in detail than a pictorial artist would care to give; but to one who loves it, no pains are too much; such a one lives in his art, and for it and by its multitudinous duties lightens his own life, and has the inestimable happiness of brightening his fellows'. He may not be a good tradesman, not a hard man, grinding down his *employés*; he may not be good at a bargain, and wanting in push, which is unusually the faculty for pushing down his neighbours; but let him once fall in love with his art, and no man can end his pleasure; life shall be one constant striving and attainment—the highest reward an active man can attain to. If you will allow me to preach for one moment—Never be tempted to accept the unworthy; only the best can ever be entirely satisfactory to the men who have raised, and are raising, in our midst glorious buildings which shall go down the centuries, telling their tale of triumph over the difficulty of our time; a standing proof that even in our century witnesses were not wanting to the truth. If you who raise the building will be true to your tradition, you will find an ever-increasing band of decorators only too anxious to work on the lines of truth and to link their own works and names with those on the muster roll of famous architects.

---

* A paper read before the Manchester Society of Architects on Nov. 6, 1894, by Mr. HERBERT BACON, of the firm of Percy Bacon and Brothers, of London.

THEATRES.—XLIV.

By Ernest A. E. Woodrow, A.R.I.B.A.

THE demand for a supplemental system of lighting in case of the failure of the gas has been touched upon in my reference to foreign regulations. It is provided for in the L.C.C. rules, which read that :—

"Additional means of lighting, for use in the event of the gas or the electric light being extinguished, shall be provided for the auditorium, corridors, passages, exits, and staircases by a sufficient number of oil or candle lamps, of a pattern to be approved by the Council, properly secured to an uninflammable base out of the reach of the public.

"Such lamps shall be kept alight during the whole time the public are in such premises.

"No mineral oils shall be permitted to be used in such lamps."

Here it must be noticed that oil or candle lamps are specified. If oil is used, the best colza oil is preferable to any other. Candles are, perhaps, better than oil; they are cleaner, and the manager can see when the lamps have been trimmed, and if they are made of a size to burn the number of hours the house is open to the public (with a margin for safety), and are renewed every day, there is no danger of the lamps going out in the middle of a performance, as there is in oil lamps which have been neglected and not been trimmed. It is easier for the manager to see that a new candle has been put in a lamp, than to see that an oil lamp has been trimmed. Candle lamps, too, I understand, will keep burning longer in smoke than oil lamps.

The form of lamp is simply a matter of taste, whether hanging lanterns from brackets or chains, or back lamps fastened against the walls, matters little, but the placing of the lamps is of vital importance.

In arranging the positions for these lights, it is well to bear in mind what their use is, and the architect is naturally the right and proper person to settle where they shall be hung. In making these arrangements, it should be supposed that the gas has gone out, and that the people have to find their way to the streets safely by the aid of these auxiliary lamps. Over each door in the auditorium should therefore be placed a lamp bearing the word "Exit" upon the glass, of a sufficient size to be easily seen and read by the audience. Such a lamp has been recently put up at the Palace Theatre. When the auditorium door has been passed, another lamp should be in view, whether in corridor, passage, or staircase, and so on; as one light is left behind, another should take its place, guiding the audience to the street. On the staircases the lights should be made to shine on the first step of a flight to prevent anyone falling down the stairs by coming unknowingly upon the step. Mr. Buckle recommends that a lamp should be hung to every third gas or electric bracket throughout the building.

The need of providing a lamp-room for cleaning and trimming the lamps was mentioned in full in a former paper.

The most recent German regulation specifies that a service of emergency lighting shall be provided to suit the special requirements of the local authorities. This service must be provided chiefly for the staircases and lobbies, and must consist of candle or oil lamps properly protected against draughts and smoke, a point which I dwelt upon in the last chapter. These rules also demand that, where specially directed, lamps showing a red light must be placed, and conclude that "the emergency lights shall be so hung that the exits can be easily found if the ordinary service happen to completely break down . . . . the lighting of the building (gas is here referred to) shall be so arranged that if any part of the supply or service be out of working order, complete darkness will not ensue." It is clearly part of the architect's duty to superintend and plan out the whole of the lighting of a theatre, whether the permanent lights or the "safety" lamps.

A very important system of lighting employed largely in theatres is the limelight, and the architect who designs a theatre must not forget that it is required, and he must not, therefore, omit to provide for its safe use. The limelight, as most of my readers are aware, consists of the burning together of oxygen and hydrogen gas on to a piece of lime, the light being thrown upon the stage by means of a lens. The storage of these gases in the building being a necessity, it is well to consider how this may be most safely done. The rules of the L.C.C. require that the gases should be stored in fireproof ventilated chambers, such as specified for gas-meters. The tanks or receivers containing the oxygen gas must be in a separate ventilated chamber from the tanks holding the hydrogen gas, to prevent the mixing of the gases and probable explosion. Two fireproof chambers are therefore necessary, both ventilating into the open air. This ventilation must be most thorough, with inlet and outlet; to confine the gases within a chamber without ample means of ventilation would be a most dangerous thing to do.

As in many things connected with theatres, the arrangements made for limelight have vastly improved of late years. All people conversant with the stage are aware of the explosions which used to occur when the gases were brought into the theatre in indiarubber bags, and there are records of deaths having happened through the careless mixing of the two gases in one bag. The methods now adopted are, when carefully attended to, reasonably safe, and accidents could not easily happen without some thoughtlessness or carelessness on the part of the workmen. The gases are now brought into the theatre, under compression, in strong metal cylinders tested to resist the great pressure of the gas. From these cylinders the gases are let off into tanks or gasometers, and water pressure is employed to force the gas through the pipes to the limelight lens. In order to avoid the danger of mixing the gases in the receivers or tanks, the screws and unions on the oxygen tank should be of different diameter to the screws on the hydrogen tank, so as to render it impossible to place the wrong gas into the wrong tank. The manufacturers of the gases provide, I believe, their cylinders with different screws—*a right-hand* thread for oxygen gas, and *a left-hand* thread for hydrogen gas cylinders. In addition to this the cylinders are often painted different colours—black for oxygen, red for hydrogen. With these precautions mixing the gases by accident seems impossible.

To avoid the necessity of transferring the gases from the cylinders to the tanks, regulators have been invented to be placed directly on the cylinders, and to insure what is so absolutely necessary for the safe usage of the limelight, an even pressure of both gases at the point where they ignite. When this arrangement is adopted, the cylinders should be placed in separated chambers in the same manner as the tanks, and not be used from the stage or flies.

The absolute necessity of two gases being used at an even pressure is in no case to be lost sight of, whether the gases are used from storage tanks under water pressure, or from the cylinders with a regulator. In the case of tanks, a glass pressure-gauge should be employed to show how much water and how much gas is in the tank. Under no circumstances should the gases be used directly from the cylinders without a proper regulator to insure even pressure. When the pressure of one gas is greater than the pressure of the other, it is apt to force its way down the pipe of the other gas, where the two supplies meet at the burner in the lens, and so cause a slight explosion. To make myself more clear, supposing the oxygen to be used from a cylinder under a pressure of 120 atmospheres (1,800lb. per square inch), which is the maximum pressure employed in these cylinders, and that there was no regulator to diminish the force of the gas from the cylinder in the supply-pipes, and supposing the hydrogen gas were not under pressure at all, then the oxygen would drive back into the hydrogen pipes, and mix before coming to the point of contact—*i.e.*, at the flame. They must only mix just before they reach the point of combustion. Such a supposition is, of course, far-fetched, as it is probable the pipes could not stand such a pressure from the oxygen; but if the pressure on one gas is greater than on the other, danger must arise, and I use this extreme illustration simply to explain the danger of unequal pressure. It is, therefore, for the architect to see that the apparatus is as perfect as possible.

I may here mention, although it is rather a technical matter, that in the lantern or limelight box the gases are generally conveyed to the lime for combustion by two kinds of jets—the blow-through and the mixed jet. In the former, they are conveyed separately up to the point of combustion; while in the latter the gases mix just below the flame in a small receiver, from whence, by a short length of pipe, they are in a mixed state thrown on to the piece of incandescent lime. The mixed jet is the more dangerous unless absolute even pressure is obtained; it, however, is said to give the finest light, and is therefore the more popular with skilled operators.

In times past oxygen used to be manufactured in the theatres, and this custom was the cause of many accidents. The introduction of the cylinders above described by the Brin Oxygen Company has done much to advance the safe usage of the limelight in theatres, and for those of my readers who care to make a deeper inquiry into the question of compressed gases and the safe use of the limelight, I refer them to Mr. Kenneth S. Murray's admirable handbook upon "Compressed Oxygen,"* which deals with the whole subject, and is made comprehensive to the most uninitiated by means of clear and simple diagrams and illustrations.

I have one word still to say about the fittings. A stopcock should be provided in the supply pipes of both gases used for the limelight, in such a position on the stage level that the gasman or fireman may have complete command over the limelight operators, and be able in case of accident to shut off the entire gas supply and thus put out the lights. The tubing leading from the main pipe (which, I should have said, must be iron barrel) must be of such a substance that, when pressed or trodden upon it will not extinguish the light and thus cause an escape. The joints between the flexible tubing and the iron barrel main must be screw unions, with stopcocks in the main and in the flexible tubing; stopcocks and screw unions must also be provided at the lens. There is a flexible metal tubing, as well as one of rubber and canvas with a wire core, which is much used for limelight gases. Soft rubber tubing should never be allowed.

It will naturally be said that the arrangements and installation of the electric light are more matters that concern the electrician than the architect, and this is true to a very great extent; yet even in this point there is much that must come under the immediate supervision of the architect. The placing and grouping of the lamps for decorative effect is entirely the architect's business. The spacing out of the lights on staircases, corridors, and passages also must be decided by him. It is to him that his client will look for the due carrying out of the authorities' regulations.

Many of the precautions mentioned for gas-lighting are applicable to the electric lighting. The switches for turning on and off the lamps in the parts of the building frequented by the public should either be out of reach of the public, or inclosed in glass cases under lock and key. This, as in the case of secret taps to gas brackets, is to prevent any unauthorised person turning off the light. The lamps on staircases, especially to the gallery and pit, should not be placed where they can be handled or broken by the public. Where they must be placed within reach of persons they should be protected by strong wire guards, or inclosed in glazed cases in recesses let into the wall.

Arc lamps are not permitted as a general rule inside a theatre. Where, however, under certain circumstances they are employed, they must be protected by strong wire guards of a close mesh, to prevent falling glass or particles of incandescent carbon.

As in the case of the gas indicating-plate, the electric light must also be governed by a switch-board fixed on the prompt side of the stage, with each switch distinctly labelled as to the portion of the system it governs. The L.C.C. rules say:—

"A switchboard, containing all the necessary switches, cut-outs, and other fittings for the control and regulation of the stage lighting, shall be fixed in some convenient position overlooking the stage.

"This board shall be inaccessible to all but the persons employed at such premises to work it."

These are all matters in which the architect must concern himself, as he must, in conjunction with the engineer, arrange the "planning" and position of the fittings. He has also to consider and to provide for the carrying out of this rule, and must design the chamber herein mentioned:—

"Resistances for regulating the power of the lights shall be mounted on incombustible bases, and shall be so protected and placed at such a distance from any combustible material that no part of the resistance, if broken, can fall on such material.

"Principal resistances shall be placed in a fireproof room reserved for the purpose."

Again, the regulation as to the battery-room must be one to which his attention must be called, as well as the chamber for "transformers":—

"Primary or secondary batteries shall be placed in rooms so adequately ventilated that no fan shall be necessary.

"The batteries shall be well insulated.

"Transformers used to transform either direct or alternating currents, together with the switches and cut-outs connected therewith, shall be placed in a fire and moisture-proof structure.

"Where the primary current is of high potential, such structure should be preferably outside the building.

"No part of such apparatus shall be accessible except to the person in charge of its maintenance."

---

* Compressed Oxygen. By KENNETH S. MURRAY, M.I.Mech.E. London, 1893. Ede, Dearberg, and Co., 40, Queen-street, Cheapside.

It is for the architect to provide these several chambers on his plans, and not for the electrician, after he takes possession of the building just on its completion, to have to devise out of the existing structure such chambers as the exigencies of the case will allow, which, more likely than not, will not conform to the requirements of the regulations. Where the electricity is generated on the premises, the architect must design an engine and boiler-room, with a dynamo chamber attached. These rooms must be approached from the street only, and not from a door leading out of the theatre; they must, in fact, be outside the walls of the theatre, and entirely separated therefrom by thick brickwork, so that should an explosion occur in these rooms it will not be felt or heard in the theatre. The design of these rooms, construction of engine and dynamos, beds, &c., require a great deal of thought and attention, as defects in the construction and arrangements may cause accidents with the lights, and consequent darkness.

The Council's regulation on this point is that:—

"Boilers, steam-engines, gas-engines, and dynamos, when used for the supply of electricity to such premises, shall be placed in such positions as shall be sanctioned by the Council.

"Gas-engines shall be placed in rooms so adequately and continuously ventilated that no explosive mixture of gas can accumulate by any leakage through the engine in the event of any of the gas-cocks being left turned on.

"A hood, connected with a pipe carried into the external air, shall be fixed over the ignition tube when this is used."

The rules of the L.C.C. for electric light in theatres appear fuller than those of any other country. I have, however, only referred to those which I think immediately affect the architect, leaving such details as wiring, conductors, circuits, switching, &c., as affecting the engineer only.

Before concluding this brief reference to electric light, I must not omit mention of the provisions made by these regulations for the stage lighting, where there is so much temporary and movable lighting employed, as in the case of gas. Perhaps the shortest way will be to quote the rules referred to:—

"Where there is a stage, special care shall be taken that all works in connection with the lighting of the stage are carried out in as substantial a manner as possible.

"No metal-work in connection with the circuits shall be exposed or so fixed or constructed as to be liable to cause a short circuit.

"Lamps on battens, footlights, &c., shall be protected by stiff wire guards, so arranged that no scenery or other inflammable material can come in contact with the lamps.

"No readily-combustible material shall be used in connection with any lamps on the stage in such a manner that it might come in contact with the lamps.

"No soft or readily-inflammable wood shall be used in connection with the lamps on the stage, and all wood shall be protected by uninflammable material from the possibility of ignition by an arc between any two parts of the two conductors, or by heated particles from any conductor or part of a conductor which may connect together the two main conductors.

"Where a number of lights, as in the footlights, battens, &c., are supplied under control of one switch, and protected by one single or double pole cut-out, as the case may be, the conductors shall be maintained throughout of such a section that they will be effectually protected by the cut-outs against heating.

"The leads to the battens shall be specially guarded, particularly at the points where they join on to the battens, and a sufficient length shall be allowed to prevent the leads receiving any injury through any movement of the battens.

"The battens shall be suspended by at least three wire ropes attached to insulators on the battens.

"On no account shall the same battens be adapted for both gas and electric light."

I would call attention to the last item in these rules, which shows that the same fittings should not be used for the electric light as for the gas-supply. Most of the other rules above quoted are drawn up on somewhat similar lines as those for the protection of the stage from gas-lights, and they should all be subjected to the architect's control, as well as the engineer of the building.

Where the electric light is the only system for the chief illumination of a theatre—that is to say, where gas is not also employed—it is as well to cause a dual installation of wires to be laid, so that every alternate light is lit from a different source. The engines, dynamos, and accumulators must also be in duplicate, one set supplying one circuit of lights, one the other. Frequently in buildings where the light is brought in from the street, and not from power generated on the premises, the dual system of lighting is obtained by connecting the mains with two different supply companies, so that should one fail the other is available.

The oil safety-lamps required to supplement gas lighting are equally necessary for a house lit by electricity, and the lamps should be arranged in the same manner as described above.

Sir Eyre M. Shaw, in the preface to the last edition of his work, mentions that as the practicability of illuminating theatres by means of electricity has been so distinctly proved, that it would seem to be a duty of licensing authorities to make electric lighting compulsory, and he draws attention to the general order issued in 1888 in the *Madrid Gazette*, making the establishment of electric lighting in the theatres of that capital obligatory, and forbidding absolutely the use of gas. A period of six months was allowed to carry out this order, and at the end of that period this decree was carried out without a single difficulty.

It must not be supposed that no fires ever arise from the electric light. On the contrary, statistics show that many do occur; but they arise from faulty materials or carelessness and ignorance in putting in the installation and manipulating the light. It is needless to add that every care must be taken to avoid these accidents, and that where every care is taken such accidents are avoided.

JERRY BUILDING AT CORK.

THE town council of Cork have received a joint report from Messrs. Robert Walker, P.P.S.A., and William Henry Hill, F.R.I.B.A., as to the foundations, footings, and superstructure walls of the new east and west wings of the municipal buildings. Messrs. Walker and Hill report that the superstructure walls, owing to the subsidence of the ground under the footings, which yielded in different places from 2in. to 4in. and 5in., cracking and crushing the weak and imperfect concrete footings, have been shattered more or less for their entire extent. The extent of the fracture is in part due to the inferior quality of the materials and workmanship of the rubble masonry. The vibration from the street and quay traffic is very considerable, and tends to promote fracture in the walls and footings, and subsidence in the foundations. The experts add: When instructions were given to reduce the cost of the scheme from £10,000 to £8,000, the three sheets of original drawings and specifications were still used, and no new drawings and specifications were prepared, the reductions being arranged for by a list of omissions and substituted works, without particulars being attached to the priced bill of quantities, instead of a new specification being written. We examined the city engineer, contractor, and clerk of works, separately and in each other's presence, with a view to fixing the date of commencing the works and discovering who was responsible for the reduction of the concrete in the footings. We also examined witnesses produced by the contractor and city engineer. The parties on each side did not agree in any particular as relating to these matters. The city engineer said he "was not on the works until the footings were just completed, owing to his being so taken up with committees." The clerk of works says, "the concrete was all finished when he arrived, and the only concrete executed after his arrival was a strip to add to the width of a cross-wall footing, so as to make the wall centre on the footing." On the other hand, the contractor stated that "he did not commence work until the contract was signed." There was no written order given for the reduction of the dimensions of the concrete footings. The city engineer says the contractor commenced three or four weeks before his contract was signed, but has no record of the time, and did not verbally, or in writing, warn him that he was doing so on his own responsibility. Nothing could be more injurious to the interests of the building than that such unhappy relations should exist between the contractor and the city engineer and clerk of works. Messrs. Walker and Hill give details of the bad workmanship and poor foundations, explaining that "the walls are not solidly built, properly hearted, crossed, or bonded. We find that the foundations relied on from the first consist of city refuse and rubbish thrown in on the slob formed by the river *detritus* and sewage deposit." In conclusion, they say: "No. 1.—The foundations relied on originally were not sufficient, having regard to the fact that they consisted of made ground formed of rubbish and city refuse laid upon the slob deposit of the river. The footings, however, provided in the drawings originally—and which we cannot find to have been altered in the amended scheme—would have tended to resist the subsidence and rendered it more uniform, and in its results less injurious to the superstructure. No. 2.—The footings of concrete are shown in the contract drawings to be 3ft. thick throughout. They have been reduced to 1ft. 6in. thick, and in parts to a less thickness, and are reduced in breadth also—namely, the footings to main walls have been reduced from 3ft. 6in. by 3ft. and 3ft. by 4ft. to 4ft. 6in. by 1ft. 6in.—that is, within a fraction of one-third of their specified dimensions, and their strength reduced to one-fifth of their original strength. The concrete is inferior in quality; its component parts are not in the proper proportions, being specified to consist of 3 parts of washed gravel, 1 part of broken stones, to 1 part of cement; no sand specified, which is a serious omission. No. 3.—The footings, in their present condition, are utterly insufficient, being reduced to nearly one-third of their original sectional area and to one-fifth of their original strength. No. 4.—The footings, in order to insure the stability of the buildings, must be reconstructed, and be properly formed of adequate dimensions, resting on a sound foundation. And it will be necessary to rebuild the superstructure walls, both as a contingent necessity and owing to their defects and shattered condition."

CHIPS.

Extensive house-building operations are in progress in the suburbs of Leeds and Bradford. The Hawkesworth Wood estate at Kirkstall, of over 200 acres, is being laid out for the erection of detached and semi-detached residences, with gardens.

Additions recently made to a wool store at Pyrmont, Sydney, N.S.W., were formally opened on Sept. 26th. The extension covers an area of 140ft. by 300ft., and has been carried out from plans by Mr. H. C. Kent, M.A., Messrs. Strutt Brothers were the contractors, and Mr. W. McDonald was the clerk of works.

Sir John Gilbert, R.A., has promised to present to the art gallery of Blackburn his well-known painting, "The Baggage Waggon," and a landscape entitled "Keston Common, Kent." The Hon. John Collier's picture of "Hetty Sorrel" has also been presented to the same collection; and the portrait of Mr. A. N. Hornby, the Lancashire cricketer, also by Mr. Collier, has been presented by his brother, Mr. W. H. Hornby, M.P. for the borough.

An accident occurred in Dundee on Friday, which resulted in the death of one man and the injury of two others. In the morning five masons were working upon a scaffold erected 40ft. from the ground, and on the inside dividing gable of a tenement in course of erection in Scott-street. Without any warning part of the gable gave way and fell inside, carrying the scaffolding and men with it. William Lyon, residing in Lochee, was killed instantaneously, and two others were badly injured.

The engineering staff of the Furness Railway Company are at present surveying the route of a railway from Bardsea, on the shore of Morecambe Bay, to Barrow-in-Furness. The new line will strike off from the present main line about two miles below Ulverstone, and, after skirting the shore for some five or six miles in the direction of Rampside, strike across the country in the neighbourhood of Roose to Barrow, a distance of about nine miles. The new line will enable the traffic to be carried from Carnforth to Barrow and Whitehaven almost at a dead level.

Some bronze gates have just been erected, at a cost of over £700, at what is now the main entrance of Newnham College, Cambridge, under the archway of Pfeiffer-buildings, and on Saturday were formally presented to the council on behalf of the students of the college, by whom they were given as a memorial of Miss Clough, the late Principal. The work has been executed by Mr. Thomas Elsley, from designs by Mr. Basil Champneys, the architect of the College buildings.

LLANDUDNO MUNICIPAL BUILDINGS: SELECTED DESIGN.

The design here shown is that by Mr. T. B. Silcock, of Bath, which was selected by the assessor, Mr. T. M. Lockwood, F.R.I.B.A., out of about 50 designs submitted in the recent competition. The design may be characterised as a free treatment of English Renaissance, and an attempt has been made to express the arrangement of the plan upon the exterior. The walls will be built of Yorkshire stone, and lined with brick, and the roof will be covered with green slates. The council chamber occupies the whole of the first floor of the centre block, and immediately adjoining are the committee-rooms and clerk's office. The room is lighted by three large windows, and the interior is elaborately treated with engaged columns and arcading supporting a coved ceiling. A feature of the design is the large public hall, which is placed at the rear of the building, and inclosed by the wings. This room will be lighted by ten semi-circular side windows and a large window at the end. The walls will be panelled, and the whole covered by a large ornamental timber roof, ceiled at the collar. Ample means of exit are provided, so that the room may be cleared instantly. This hall is so arranged, and provided with distinct cloakrooms and lavatories, as to enable it to be let for entertainments, entirely apart from the municipal portion of the building. One wing of the building is devoted to a suite of offices, two stories in height, which are proposed to be let, and for this purpose they are provided with a separate staircase and sanitary arrangements, and are entirely cut off from the municipal offices. The estimated cost of the building is about £10,000.

NEW THEATRE FOR THE PIER COMPANY, LLANDUDNO.

This new building, which it is proposed to erect on the angular piece of land in front of the pavilion at the entrance to the pier, is from the design of Mr. Daniel Arkell, architect, Birmingham. The interior arrangements are to be made as near as possible complete, the pit and stalls being placed below the level of the promenade to the pier, and approached by wide, inclined roadways, access also being obtained from the marine drive above. By means of a large staircase from the entrance lobby access is obtained to the dress-circle and balcony. This main central entrance will form a feature, and will be used as a lounge, the floor being on the same level as the pier promenade. Two gallery entrances are on the marine drive side, also an exit staircase is provided, and in all cases advantage has been taken of the different levels of the roads to avoid long flights of stairs, so as to facilitate the means of access to and egress from each floor of the building. There are entrances at each side for the private boxes, also arrangements for transfers to all parts of the house. Refreshment rooms are also provided to each floor. The dressing-rooms have been placed at the sides and rear of stage, leaving room for further extensions to the stage if desired. It is proposed to face the exterior of building with red Ruabon bricks with red Runcorn and Bath stone hammer-faced dressings. The structure will be kept as low as possible, so as not to obstruct the sea-view from the houses behind, and the roof will be flat. For the erection of the new works the Pier Company have provisionally accepted the tender of Mr. Henry Willcock, of Wolverhampton. The want of a good theatre has been long felt in Llandudno, there being at present only one place of amusement in the town, and a new theatre would add to the popularity of the place as a holiday resort.

THE CLOISTERS, GLOUCESTER CATHEDRAL.

Some of the earliest and most beautiful specimens of fan-vaulting are to be seen in the cloisters of Gloucester Cathedral. According to Professor Willis, the fan-vault was first used in this district, and he considered these cloisters to have been the prototypes of all other examples. The "great" cloister as far as the Chapter-house was built by Abbots Staunton and Horton, 1337-77, and finally completed by Abbot Froucester, 1381-1412. Our double-page plate is reproduced from the National Gold Medal drawings by Mr. Alfred J. Dunn, of Gloucester.

PRIVATE RESIDENCE AT WEST BRIGHTON.

This house is now in course of erection in The Drive, West Brighton. The fronts are built in red brick, with Box Ground dressings; the roof is covered with red tiles, from the Keymer Brick and Tile Company. Electric light will be used, and sea-water laid on; the dadoes and ceilings in hall and sitting-rooms will be panelled. A lift is provided from kitchen to dining-room. The upper floors contain eight bedrooms and bath-room, and w.c.'s on every floor. This drawing was exhibited in this year's Royal Academy. The architect is Mr. G. Warren Cooper, of 34, Hart-street, Bloomsbury.

POPLAR UNION NEW OFFICES.

(See description and sketch plan on p. 661.)

In our description of the Swedish Houses of Parliament in our last issue, p. 605, the name of the architect should have been given as Herr Helgo Fettervall.

The town council of Longton, Staffs, have instructed a joint committee to recommend a site for buildings which shall serve the purposes of a free library and science, manual, and art schools.

The dedication of the stained-glass window in memory of the Rev. Robert Henry Cobbold (rector of Ross, 1873-93) took place in the parish church of St. Mary, Ross, on Wednesday week. The window is situate on the south side of the chancel. It has three lights, on each of which is represented a figure of one of the Apostles, in the centre being St. Paul, on the right St. Barnabas, and on the left St. Luke.

The following orders have been made in the case of applications for discharges from bankruptcy:—James Hollingsworth, Morland-road, Beckenham, S.E., builder, discharge suspended for two years, ending October 9, 1896; William Marriage, Croydon, builder, discharge suspended for four years, ending October 9, 1898; Edward Franck Wyman (trading as A. Osborne and Co.), Nirvana, Bellaggio, Surrey, and Orpington, Kent, builder and contractor, discharge suspended for three years, ending October 9, 1897.

On Thursday in last week Colonel Ducat, R.E., on behalf of the Local Government Board, held an inquiry at Walsall with reference to an application on the part of the town council for sanction to a loan of £12,450, to meet an expenditure of £7,300 for kerbing, channelling, and asphalting of footpaths, £297 for the construction of sewers, £370 for the widening of Shaw-street, £780 for a new fire-engine and engine-house, and £300 for a gardener's cottage at Reed's Wood Park.

Major Davis, F.S.A., the city surveyor of Bath, who has been conducting further excavations, has reported to the corporation that he had unearthed undoubted proof that the Romans drank as well as bathed in the mineral waters. Old drinking vessels had been discovered, together with numerous Roman ornaments and coins of the period of Nero.

Engineering Notes.

Birmingham.—Good progress is being made with the tunnel scheme of the London and North-Western and Midland Railway Companies under the principal streets of Birmingham. The destructive portion of the work is practically now quite completed, and, extending side by side with the present railway for a distance of 622 yards, a space about 66ft. in width has been taken in hand. Throughout this tract, between New Bartholomew-street and Worcester-street, demolition of buildings has been going on apace, simultaneously with the work of constructing the brick arch of the new tunnel. The new line will tunnel on the cut and cover-in system side by side with the old. In the purchase of properties, in compensation to owners and tenants, in pulling down buildings, and in propping and underpinning others, an expense of £80,000 has been incurred; but as nearly the whole of the line will be covered, and the ground again utilised for buildings, the preliminary outlay will not be altogether a dead loss. The new railway works will consist of a double set of rails running through a tunnel 10ft. to the south of the present line, the rails being from 10ft. to 31½ft. below the street surface. From New Bartholomew-street the extension is carried out on the north side of the old line, and that section of the work begins which has for its object the substitution of viaducts for the level crossings of one railway over another, which hitherto have so complicated and hindered the North-Western and Midland traffic in and out of Birmingham.

CHIPS.

The foundation-stone of St. Margaret's memorial Roman Catholic church will be laid at Dunfermline on November 16, by Lady Margaret Crichton Stuart, daughter to the Marquis of Bute.

The Abercromby Liberal Club in Hope-street, Liverpool, has recently been enlarged by the addition of a billiard-room at the back of the premises. The new room, which is 30ft. long by 26ft. wide, was planned and designed by Mr. N. Proctor, and Messrs. J. and T. Crosby, of Chatham-street, Liverpool, were the contractors. The formal opening took place on Monday.

The new church of St. Gabriel, Huyton Quarry, was consecrated by the Bishop of Liverpool on Thursday, the 1st inst. The church and site have cost £4,000. The building is Early Perpendicular in style, the window dressings of terracotta, and there is a large half-timbered porch. Accommodation is provided for 350 persons. Mr. G. Bradbury was the architect, and Mr. I. Dilworth, of Wavertree, was the sole contractor.

A new parish school was opened at Keynsham on Tuesday week. The cost has been £650, or £3 12s. 8d. per head, exclusive of furnishing and fencing, &c. Mr. Lingen Barker was the architect, and Mr. T. Hyde the builder.

Mr. C. Hawksley, who was called in as arbitrator in the Torquay water dispute, has recommended the town council to purchase the whole of the watershed from which the town derives its supply.

At Middlesbrough to-day (Friday) Alderman William Lockwood Taylor, painter and decorator, who has been a member of the corporation since 1877, will be elected as Mayor.

The parish church of Freeby, near Melton Mowbray, was reopened last week, after restoration at a cost of £1,300. Mr. W. H. Harrison, of London, was the architect, and Mr. E. Clarke, of Melton, the contractor.

Mr. Macdonald, at present surveyor to the local board of Gainsborough, has been appointed to a similar office under the Rugby local board.

The electric-lighting installation at Bolton was formally inaugurated on Friday. It has been carried out at a cost of £23,000, Mr. J. H. Rider being the electrical engineer, and the system is that of an alternative high-pressure current, with transformers.

Colonel E. M. Lloyd, R.A., Local Government inspector, held an inquiry on Wednesday week at the Retford Town Hall as to the application of the town council to borrow £2,000 for the erection of baths.

The formal opening of the electric works established by the corporation of Southport, at a cost of about £13,000, will take place to-day (Friday). The installation will be equal to 4,200 8-candle power lamps, while already applications have been sent in for 4,700 lamps. The generating station is adjacent to the gas-works at Blowick, two miles inland from the centre of the town.

OBITUARY.

Mr. C. G. H. Kinnear, A.R.S.A., F.R.I.B.A., Colonel of the Midlothian Volunteer Artillery, died very suddenly from heart-disease at his residence, 12, Grosvenor-crescent, Edinburgh, on Monday afternoon. There was to have been a mess dinner of the Volunteer officers on Tuesday night, at which Colonel Kinnear would have presided, but it was at once abandoned. Charles George Hood Kinnear was the younger son of the late Mr. Charles Kinnear of Kinnear and Kinloch, J.P. and D.L. for Fife. His elder brother is Mr. John Boyd Kinnear, for some time M.P. for East Fife. Born in 1830, Mr. Kinnear was trained for his profession in the office of the late Mr. Bryce, and thereafter, at first, practised on his own account. Subsequently he entered into partnership with the late Mr. Dick Peddie, M.P., and for five-and-twenty years no firm was better known in the profession, says the *Scotsman*, than that of Peddie and Kinnear. Later its designation has been Kinnear and Peddie—a son of Mr. Kinnear's old partner having taken his father's place in it. A number of important public buildings were designed by the firm, among which might be mentioned the University Club, Edinburgh, the Scottish Provident Institution, the St. Cuthbert's Poorhouse, the municipal buildings, Aberdeen; the Sheriff Court-house, Glasgow; and the Royal Bank, Glasgow. The firm were also the architects of Cockburn-street. One of their latest works was the new West End station, Princes-street. Mr. Kinnear, however, was known as the designer of a large number of mansion-houses in all parts of Scotland, many of them in the Scots Baronial style. Two years ago the Royal Scottish Academy paid Mr. Kinnear the compliment of electing him an Associate, and three years since he joined the R.I.B.A. as a Fellow. Of the smart regiment of Artillery Volunteers of which he was colonel, he was, it is believed, save one, the oldest member. Mr. Kinnear joined the Midlothian Coast Artillery, as it was then called, in the end of 1859 as a gunner. As he stood over six feet in height, he was selected for a commission in a grenadier company which was formed in July, 1860, and he was gazetted colonel of his old regiment on the 20th June, 1884. Since then Colonel Kinnear had devoted himself assiduously to further the interests of the regiment. He was successful in getting the Commander-in-Chief to sanction the dropping of the word "Coast" from the designation of the corps, and to change the headquarters from Leith to Edinburgh. He was chairman of the Local Defences Committee under the National Defences Mobilisation Scheme, an active member of the Council of the Scottish National Artillery Association, and a member of the East of Scotland Tactical Society. Colonel Kinnear married, in 1868, the eldest daughter of Mr. Maxwell, of Munches, by whom and their family of two sons and five daughters he is survived. The funeral took place yesterday (Thursday) afternoon at 2.30 from St. John's Episcopal Church, Edinburgh, of which he was a vestryman, and full military honours were accorded to the deceased.

Mr. Philip Gilbert Hamerton, the editor of the *Portfolio*, and author of many works on art, died on Sunday at his villa, Parc des Princes, Boulogne-sur-Seine, at the age of 60. Born at Laneside, Lancashire, he was educated at Burnley and Doncaster Grammar Schools, and in 1855 went to France to study landscape-painting and French literature. From 1866 to 1868 he was the art critic of the *Saturday Review*. In the latter year he published his "Etching and Etchers," and "Contemporary French Painters," and from that time forward Mr. Hamerton was a prolific author. He established the *Portfolio* in 1869, and continued to edit it down to the present month's issue, though the form of it has been changed of late months. He also published a technical primer on drawing and engraving, "The Etcher's Handbook," a biography in French of Turner, and was part author of "English Painters of the Present Day," and, with Mr. W. Clark Russell, of "The British Seas."

Mr. John Francis, C.E., of Easton-on-the-Hill, died last week from apoplexy and paralysis. As a young man, Mr. Francis took a part in the erection of the Crystal Palace, and also in the erection of many of the great railway-stations in London. He then went to Italy, where he pursued his profession, his greatest achievement there being the erection of a bridge over the River Tiber at Rome, and afterwards lived in India, where he laboured for 23 years in carrying the Great Indian Peninsular Railway far into the interior, and in constructing many of the bridges on that company's system of railway. Of late years he had lived in retirement at Easton, Lincolnshire.

ARCHITECTURAL & ARCHÆOLOGICAL SOCIETIES.

Birmingham Architectural Association.—The president of this association (Mr. William Henman) delivered an address to the members on Friday, Nov. 2, upon the programme for the coming session. In referring to the education of public taste in the matter of architecture, he said that some advance in this direction had during the last few years been undoubtedly made, but that "love of money, which is the root of all evil," and the bane of good architecture, not only stifled the art, but disfigured every building with hideous signs and letterings. The time had come when the public should protest against the display of this vulgarity, and local authorities should obtain powers to suppress it, as in old times Acts of Parliament were passed to curb the excessive display of signboards, which, compared with modern advertising methods, were greatly to be preferred for their generally artistic treatment and effect. If, instead of detaining students for hours together in overheated and badly-ventilated classrooms of our schools of art, daubing paints and laboriously stippling, they were frequently conducted through the streets of our cities and towns under the guidance of men of taste, and taught to appreciate the good in architecture, to despise what is base and degrading therein, to observe the inartistic design of our lamp-posts, street-name plates, and other efforts of officialdom, we might hope that the next generation would not be oppressed by so many impecunious painters of mediocrity, or the exhibitions flooded with their puerile productions. Such a revolution in popular artistic perception and work could only be brought about in the course of time. It must necessarily be of slow growth; but if never a voice be raised against the present deplorable state of things, it would go from bad to worse. In this age of hurry it was well that some things moved slowly, in the hope that when times were ripe and ideas matured men might rise endowed with power worthily to carry out desired objects. Might this be the case with regard to the much-talked-of Birmingham cathedral, so that when, some years hence, it is decided a cathedral shall be built, public appreciation of architecture may be so far advanced that the question will never be raised, as it had been during the last few days, whether it would be practical to "convert a Grecian (?) church into a Gothic cathedral." If the taste and demands of that day determined that the site of St. Philip's Church should be that of Birmingham's cathedral, then although he gave place to none in reasonable reverence for work of the past and much admired the tower of that church, he sincerely hoped it would not be allowed to influence the style of a building which must necessarily be of greater importance, nor that it would simply make way for a "Gothic cathedral." He would rather that the inhabitants of the city and neighbourhood would, with one voice and open purse, demand that the building should be worthy its position, designed by able hands in the best style of the period, whatever that may be—so long as it was neither a mere archæological compilation of dead bones, nor an eccentric novelty devoid of all traditions of architectural propriety. A hearty vote of thanks was proposed by Mr. H. R. Lloyd and seconded by Mr. John Goodman, Messrs. Harrison, Silk, Percival, Cox, Buckland, and C. E. Bateman supporting the motion, which was carried with acclamation. Upon the proposition of Mr. Henman, seconded by Mr. Harrison, a vote of congratulation to Mr. W. S. Till, the city surveyor, was passed upon his recovery after his long and severe illness, at the same time acknowledging his uniform courtesy in all matters brought before his notice by the profession.—The annual report of the council just published states that the acquisition of the new rooms in the Exchange Buildings has proved of great benefit in extending the work of the association. The class of design is permanently arranged for at the School of Art under the immediate direction of Mr. W. H. Bidlake, M.A. The meetings have shown an increased attendance, and the change of the time for visiting buildings from Saturday afternoons to Friday evenings led to a great increase in the number of members attending. The syllabus for the ensuing session is as follows, all meetings being held at 6.45 on Friday evenings:—Nov. 16, "Architectural Education," E. R. Taylor; Nov. 30, "Preparation for R.I.B.A. Examination," F. R. Farrow; Dec. 14, "Restoration of Ancient Buildings," J. A. Cossins; Jan. 11, "Treatment of Architectural Modelled Ornaments," Wenlock Rollins; Jan. 25, "Preparations of Drawings for the R.I.B.A. Prizes," H. R. Appelbee; Feb. 8, "The A.A. Excursion to Italy," Robt. Hamilton; Feb. 22, "Small Houses: Treatment of Plain and Decorative," T. W. F. Newton; March 8, "School Planning," Hy. Beck; March 22, "The Sketching Visit to Broadway," with the lantern, H. R. Lloyd.

Glasgow Architectural Association.—The usual monthly meeting was held on Tuesday evening in the Rooms, 114, West Campbell-street, the president, Mr. A. N. Paterson, in the chair, when Mr. J. Kennedy Hunter (Messrs. Morris and Hunter, Ayr) delivered a lecture entitled "On Tramp," being the description of tours in Northamptonshire, from Kettering as a centre, undertaken in September of this year. Photographs from Mr. Hunter's camera of many interesting parish churches, and some Domestic work, were exhibited by means of limelight, the lecturer adding a running commentary. Among others, views were shown of the Eleanor Cross at Geddington, St. Sepulchre's at Northampton, one of the few circular churches in England; the famous Saxon tower at Earls Barton, and several different views of Peterborough Cathedral.

Philosophical Society of Glasgow.—The following is the syllabus of the Architectural Section for the current session:—To-night (Friday), Nov. 9: Opening meeting; conversazione. Nov. 19: Presidential address by Mr. T. L. Watson, architect, F.R.I.B.A. Dec. 3: Mr. Thomas Gildard, architect, on "An Old Glasgow Architect on Some Older Ones." Dec. 17: Mr. Alex. N. Paterson, M.A., architect, on "Some Principles of Decoration." Jan. 21, 1895: Mr. Francis H. Newbery, Head Master, School of Art, on "A Look Into the Workshops, Past and Present." Feb. 4: Mr. James Paton, F.L.S., Curator, Corporation Galleries, on "Mosaics." Feb. 18: Mr. Richard Ferris, sculptor, on "The Relation of Modelling to Sculpture and the Industrial Arts." March 4: Sir William Arrol on "Iron Construction in Modern Buildings." Wednesday, March 6: Col. R. W. Edis, F.S.A., F.R.I.B.A., London, on "Internal Arrangement and Decorative Treatment of Town Houses." March 18: Mr. Lewis R. Crosskey, of the Glasgow Technical College, on "Industrial Art, with Special Reference to the Training of Artisans."

CHIPS.

At the London Consistory Court, on Tuesday, a faculty was granted for restoring the parish church of Northwood, Middlesex, and adding a north aisle.

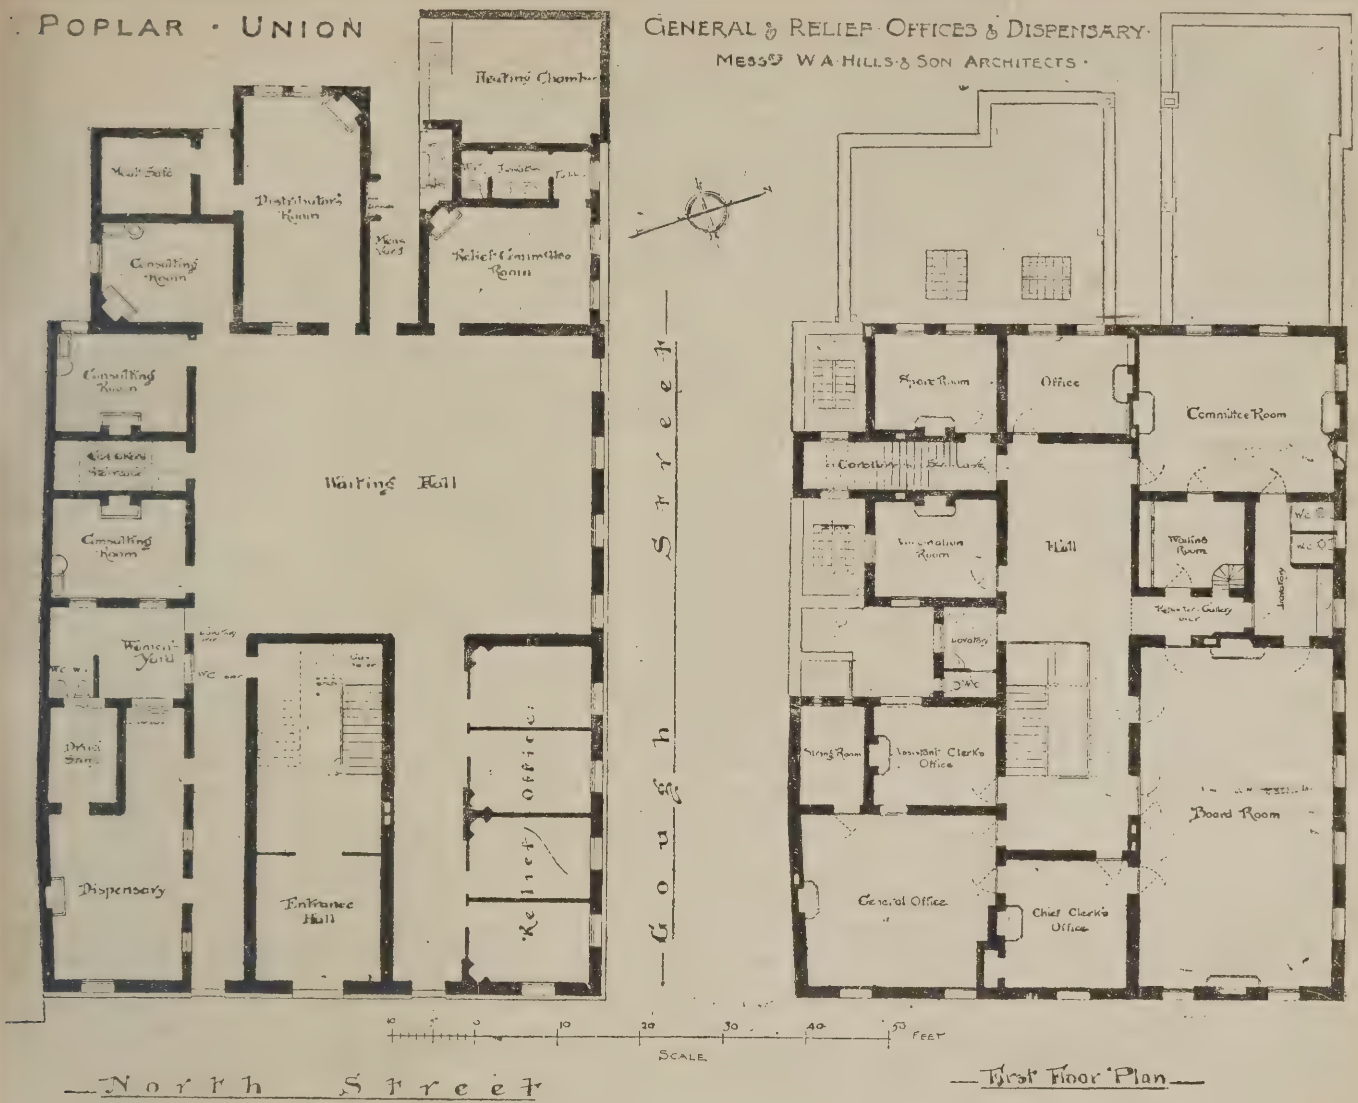
The Lancashire county council discussed at their last meeting a resolution requiring all contractors to adopt a "fair contracts" clause. It had been negatived on the last occasion, and was now again rejected by 39 to 25 votes.

Mr. Matthew Piers Watt Boulton, of Yew Park and Haseley Court, Oxfordshire, who died on the 13th June last, aged 74 years, left personal estate valued at £62,071. Mr. Boulton was a grandson of Matthew Boulton, of the Soho Works, Handsworth, the improver of the steam-engine and partner of James Watt.

A new spire, 150ft. in height, and built of Bath stone, has just been added to St. Luke's Church, Maidenhead. The architect is Mr. John Oldrid Scott, F.S.A., and the builders were Messrs. Silver and Sons, Limited. The carved heads are by Mr. H. Turner Hems, of Exeter, of the firm of Harry Hems and Sons.

A Government inquiry, held at Liverpool on Friday, to consider the application of the corporation for a loan of £26,000 to enlarge the Netherfield-road Hospital, provoked much opposition on the part of residents in Everton, the main objection being that the presence of the institution had depreciated the value of property.

The Sedgwick Memorial Museum Syndicate report to the Senate of Cambridge University that the cost of the building proposed to be erected exceeds the architect's calculations by the sum of £4,500. They therefore recommend that they be empowered to reconsider the plan approved by the Senate, and, if necessary, to substitute a new one for it, and that they report to the Senate before the end of the ensuing Lent term.



POPLAR UNION.—NEW BOARD ROOM, ADMINISTRATIVE BLOCK, DISPENSARY, AND RELIEF OFFICES.

THESE new buildings have been erected upon the site of an ancient residence, lately used as a small infirmary, which, until the beginning of this year, stood upon the west side of Upper North-street, not far from the East India Dock-road, in the parish of All Saints', Poplar. For the past fifty years the house had been used by the guardians for the isolation of persons suffering from infectious disease. The new buildings occupy a corner position, with street frontages of 67ft. and 120ft. respectively, and were built with red brick and Portland stone by Mr. William Shurmur, of Clapton, from the designs of Messrs. Walter A. Hills and Son.

PEN DRAWING AND PEN DRAUGHTSMEN.

[WITH LITHOGRAPHIC ILLUSTRATIONS.]

WHEN Mr. Joseph Pennell's sumptuous book was first published in 1889 we gave a somewhat extended notice of his very comprehensive and exceedingly interesting volume, and we printed with our remarks some specimen illustrations,* which were much appreciated. Nothing succeeds like success, and to-day we are enabled to draw the attention of our readers to the second and enlarged edition of the same admirable work which Messrs. Macmillan and Co. have just issued,† as one of the leading art books of the present publishing season, with more than double the number of illustrations of the first edition. The accompanying specimens, reproduced among our lithographic plates, will serve to show how varied a choice has been made in this representative collection which Mr. Pennell has compiled for the information and amusement of his readers. The author, always inclined somewhat to ride the high horse, naturally enough, and perhaps with good reason, takes to himself the credit of having discovered the faults of his original volume, it having been left to him, he says, to correct and amplify his own facts. Nothing appears to him more patent than the imbecility of those who ventured to criticise his book, and in all cases, seemingly, he finds, after mature reflection, that he was right, while "stronger arguments than cheap sneers and poor sarcasm from anonymous writers" are needed to prove him to have been wrong. Whatever the value of Mr. Pennell's remarks and theories, as he calls them, it is certain that the leading merit of his book, and manifestly the main reason of its success, is to be found in the admirable collection of leading men's work which, with the aid of the publishers, he has been enabled to get together. The only three artists who declined the benefit of the advertisement thus to be obtained, judging from the preface, were Messrs. Charles Shannon, Charles Ricketts, and Professor Herkomer. Mr. Pennell claims to have been as liberal and broad as he could, and we must admit he praises with ingenuous expediency a great diversity of styles, and illustrates a wide variety of methods, although, after all is said and done, he does not feel able to consider Spanish illustration among the final expressions of art, neither does he pin his faith to the methods practised by Mr. Morris and his school. Anyhow, it is abundantly clear that it would be impossible to please everybody, even when one is disinterestedly actuated by so wholesome and stimulating an object as that which Mr. Pennell says limited his ambition in this matter—viz., to help artists only. It would be difficult for anyone to gather together so comprehensive a series of examples of pen-and-ink draughtsmanship within the covers of one book, as that which we see before us, without producing an object lesson of the first importance, and on the whole the critical remarks with which the samples of work are accompanied are, we dare say, much to the purpose, and often are certainly cleverly expressed; but tall talk, wherever found, is appraised at its actual value, and it does not really enhance the permanent worth of any treatise. The inference, too, that only since this work of Mr. Pennell's was published, five years ago, "all intelligent art criticism has come to be written by working artists," is as gratuitous as the statement that the second edition of the book has been rendered possible by the spite, envy, and malice of those who ventured to criticise it originally. It is because we were among the foremost to acknowledge the cleverness and enterprise which rendered such a book possible, that we regret the airs assumed in this instance by the editor, whose hectoring style is not more graceful than it is convincing. The chapter on Architectural Pen-drawing which, at any rate, widened the interest of the original book, has now been entirely omitted, and the few examples of the pictorial representation of architecture which figure in the volume are grouped with other artistic work which is considered from a perfectly different standpoint, only about a couple of dozen lines being devoted to the chapter on "Architectural Illustrations," with four drawings from *Harper's Magazine*. One of the new plates in the book is an over-delicately toned and harmonised reproduction of our old friend, "St. Simeon Stylites," drawn in pen and ink by the late Wm. Burges, A.R.A. (see BUILDING NEWS for April 17, 1874), whose study is described by Mr. Pennell as one of the best architectural drawings he has ever seen. He knows, however, so little about architects as to describe its author as "E. W. Burgess, R.A.," a statement sufficiently inaccurate to make poor Burges turn in his grave, for he was conspicuous as a "stickler" over the spelling of his name. Oddly enough, in the suppressed article wherein Burges was quoted as an authority on architectural drawing, his name was given correctly. However, we should not have referred to what, after all, may be thought a trifle if Mr. Pennell had not accorded to infinitesimal items in other directions an undue importance, thereby narrowing his view and unduly enhancing mere casual details of pictorial mannerisms affected by comparatively unheard-of draughtsmen, whose merit at best is but of transitory interest, and whose work can only be justly estimated, of course, by time. The book has been brought up to date by the inclusion of the last contemporary artist of any consequence in vogue at the date of its issue, and much of the material thus garnered from Europe and America is extremely clever and very beautifully printed. To single out any individual specimens for special remark from so vast an assemblage is not easy, and, moreover, seems somewhat invidious; but we may venture upon one or two such references. Among these we may name Mr. F. H. Townsend's behind-the-scenes sketch called "Silence," originally printed in *Pick Me Up* from a block by Dawson. The drawing is excellent, and so is Mr. Phil May's "Old Parson," wherein every line tells, and the sense of humour is well-nigh perfect. Mr. Raven Hill, too, has this same faculty, coupled with a due care for accuracy in matters of local detail. None surpass, of course, the exquisite skill displayed by Mr. Bernard Partridge, whose drawings in *Punch* have made his name familiar. Charles Keene holds his old place as one of the few men who deserved a good word from every one, and in contrast to his honest, healthy studies, some of the mad follies of Mr. Aubrey Beardsley are shown with a too ample notice, expressed somewhat in qualified terms, it is true, but still over-laudating such vagaries in which gross extravagance passes for merit, and the impossible ranks as subtle invention. The same old subjects, well advertised already several times, figure here as specimens of this arabesque manipulator in black and white. From France and Germany, as well as from America, Mr. Pennell has included much that we are glad to see, and his practical remarks about process-work are very good indeed. We will, in concluding our perhaps too brief remarks, direct attention to the subjects, which by the courtesy of Messrs. Macmillan and Co., we are enabled to group together among our lithographic plates to-day. The central design of "Diana," from the *Hobby Horse*, is by Mr. Herbert Horne, and its thoroughly decorative character seems, in many respects, quite admirable. The Guild publication, from which it comes, deserves the condemnatory remarks which Mr. Pennell has made concerning it. "The Old Garden Gate," by Mr. Alfred Parsons, to the right-hand of our plate, like all this capable artist's work, is perfect in its completeness, thoroughly suggestive, and true to nature. Note the grouping of the sunflowers: how naturally they grow, taking their place in the composition with grace and ease of line, while they assume, notwithstanding, a distinctly decorative aim, clearly intended by the designer. On the other corner of the double page is a direct reproduction of Dürer's "Big Horse," from a print in the British Museum, which we have chosen to show the advantages of the process block over the wood-engraver's art in cases where facsimile copies are desired. The automatically correct photo-engraving reproduces the actual lines—defects and all, of course—whereas the wood-engraver has to cut around and produce new ones for himself, which never can be perfectly done. Mr. Pennell exhibits a wonderfully good block engraved in this way by Mr. R. Paterson of the same subject, and so a complete comparison is readily instituted. The view of Mushrabiyehs shown from Old Cairo is a copy of a drawing by the American draughtsman, Mr. H. D. Nicholls, and, like the corresponding architectural study in the right-hand upper corner of the plate in illustration of the dormer and chimney from the Chateau de Chambord by Mr. H. Hawley, is taken from *Harper's Magazine*, in which journal buildings are often represented with a proper respect to their detail, without any loss of pictorial interest and quality. The sketch of "Heron Court," by Mr. E. H. New, follows the restrictions peculiar to the rest of the Birmingham school in his treatment, which is rigidly conventional, the idea being that all illustrations, after the theory of Morris and Crane, must be made to harmonise in colour and in line with the type, and that they must be printed simply and naturally with it. All realism, they say, is out of place in a book, and pictures which these worthies contend are not decorative—that is conventional, in black and white—are to be kept in portfolios or hung on walls. The "Arabian Nights Genii" study by Mr. J. D. Batten is marked by a keen appreciation of humour, and it is well befitted to the fancy of legendary art, to which this artist has with so much originality devoted himself and found imitators. The book is beautifully printed and artistically got up, with the illustrations admirably disposed throughout the volume. The numbering, of the pages in many places is not completed, unfortunately, so that reference to the index is frequently a matter of no little difficulty.

† Pen Drawing and Pen Draughtsmen: their Work and their Methods. A Study of the Art of To-day, with Technical Suggestions. By JOSEPH PENNELL. London and New York: Macmillan and Co. 1894.

CHIPS.

M. Quellencé, at present consulting engineer to the Greek Government, has been appointed chief engineer to the Suez Canal Company, in succession to the late M. Lemassan.

Another park has just been secured for the densely populated south-eastern suburbs, the £36,000 required for the purchase as an open space of some 17 acres of vacant land adjoining the Lower-road at Deptford having been secured by grants and subscriptions.

The ancient parish church of Whitfield, near Dover, one of the smallest in England, has been restored and enlarged, and was reconsecrated on Friday, by the Bishop of Dover.

The foundation stone of the Wintringham Higher Grade School, Eleanor-street, Grimsby, was laid by Mrs. Wintringham last week. The building, with the site, will cost £11,500. Mr. Herbert C. Scaping, of Grimsby, is the architect, and Messrs. Hewins and Goodhand are the builders.

A bronze torque, found in 1837 in the garden of Tower House, Wraxall, by the late Mr. C. L. Coathupe, has just been presented to the museum at Bristol by his son, Mr. E. W. Coathupe, who is now retiring from the post of chief constable of that city.

The vestibule at Windsor Castle, which contains the gifts presented to the Queen upon the occasion of her Jubilee, has just been redecorated. The whole of the State apartments, with the exception of St. George's Hall, have been gradually renovated during the last five years, under the supervision of Mr. Leonard Collman, her Majesty's inspector.

By 103 votes to 4 the London County Council decided on Tuesday to give the necessary notices for the acquisition of the section of tramway, 2¼ miles in length, between Kennington-park and Great Dover-street, Old Kent-road. It was also determined to reintroduce into Parliament next session the Bill relating to the southern approach to the Tower Bridge, the line of route previously decided upon being adhered to.

Mr. James Fraser Redgrave, late chief clerk in H.M. Office of Woods and Forests, died at Eltham on Sunday, aged 70 years.

The Duchess of Albany paid a visit to Deptford on Tuesday, and opened the newly-erected St. Luke's mission hall in Gosterwood-street. She drove from hence to the Goldsmiths' Company's Technical and Recreative Institute at New Cross, to inspect the various classes at work.

The first sod of the Manchester, Sheffield, and Lincolnshire extension to London line will be cut in the Alpha-road, St. John's Wood, at noon on Tuesday next, the 13th inst. The ceremony will be performed by the Countess of Wharncliffe, and a luncheon will be afterwards given at the King's Hall, Holborn Restaurant.

The parish church of Aughton was reopened last week by the Archbishop of York, after restoration of the chancel, nave, and tower.

Alterations and improvements have been effected in St. Margaret's Church, York. Mr. W. H. Tarran, of Fishergate, York, was the contractor.

Mr. George Jacques, of Silsden, has given instructions, along with his architects, Messrs. Bailey, of Bradford and Keighley, to Messrs. Wm. Potts and Sons, clock manufacturers, Leeds, to provide and fix a new Cambridge quarter chime clock, with four illuminated dials, and five new bells, in the tower of Silsden parish church; while Messrs. Bailey, the architects, are also raising the tower, and adding a spire to the same, at Mr. Jacques's cost.

The Carlisle City authorities have given instructions through the city surveyor, Mr. W. Howard Smith, C.E., to Messrs. Wm. Potts and Sons, clock manufacturers, of Leeds, to place a four-dialled illuminated turret clock, which will be a great boon to the inhabitants, in the tower of the Fine Art Gallery, Tullie House, which is considered one of the finest in the kingdom. Messrs. Potts made the clock at the new markets, which has given every satisfaction.

WAYSIDE NOTES.

The latest big advertisement for London—the capital, not the newspaper—of the London County Council has not proved worth much. Not many people ever thought Boadicea was buried in Parliament-hill. The "tumulus" has been searched, but the only relics found in it were a bullet, which could not possibly have any relationship to the British warrior-queen, and a few 17th-century pots and sherds. It seems that not far from the large tumulus there is a small one, and enthusiasts who live in the neighbourhood, and are loth to see Hampsted lose one of its most cherished Royal associations, are hinting that, perhaps the little mound may be the real one, and propose that it should be explored also. But among experts a pretty strong idea exists that both the small and the great are quite modern affairs. Perhaps some favoured excavator can now get a job out of the L.C.C. on Primrose-hill? An enthusiastic archæologist of our acquaintance has always protested that it was there the British warrior-queen was finally disposed of—with a prophetic eye doubtless to the ultimate propinquity of the Zoological Gardens.

Very likely many readers of this column look out year by year for the interesting collection of drawings which Mr. Mendoza gathers together for his annual "Black and White" exhibition in the St. James's Gallery, King-street, S.W. The twelfth of the series was opened last Monday, and, as heretofore, the class of work shown is interesting, if not entirely representative. I dare say the best has been made of the material contributed; but the show, somehow or other, did not strike me as being up to the average. The architectural subjects, too, with a few exceptions, hardly merit attention, and some very old friends among other classes of subjects put in an appearance. Mr. F. G. Kitton's pretty pen sketch (59) of the Shrine of St. Alban, from St. Alban's Abbey, is from his big book, and this drawing was illustrated in the BUILDING NEWS for March 23rd last. "Winchelsea," by Mr. G. C. Haité, is the title of a slight study of a slight subject, dashingly suggested; and the same draughtsman's vignetted washed view of Dorking, with the church spire in the centre of the picture, looks suitable for a family magazine, for it is picturesquely handled in a popular manner. Mr. T. R. Macquoid is more serious in his faithful portrayal of the Rathhaus staircase at Lübeck; while Miss Marion Logsdail, ever diligent in her sketches of architecture, is capitally represented with good subjects from Barcelona and Old Yarmouth. Whether at home or abroad, the same sun and shadows intensify her delineations, which are, generally speaking, lacking in half-tones.

Following the lead of illustrated newspaper sheets, Mr. Holland Tringham rather overcrowds his paper, to the detriment of artistic effect; but his drawings are clever and crisp, without being scribbled about with meaningless twiddles and conventional impossibilities introduced with a notion for chousing colour, mere trickery of fashion both temporary and trivial. The sketches from Tangier, Morocco (157), are fair specimens of his work. The sheet from Shepperton and Richmond is too high up to be seen. "The Old Gateway, San Remo" (198), by Mr. William Thomson, is a bright, sunlit pen-study of a florid archway of graceful and rich Renaissance detail. Mr. Claude de Neuville sends "St. Nicolas, Pyrford, Surrey" (207), a small countryside church seen in winter. The microscopic dotted method adopted suggests the limitations and mannerism of a photograph, insuring accuracy, to the loss of dash and artistic style. The pulpit and pewing from All Hallows Barking, by Mr. Hanslip Fletcher, is a small, truthful drawing, hung badly for inspection, while the sunless and scrubby pencil sketch of St. Martin's-in-the-Fields, by Mr. Wm. Cowley Stevenson, occupies a large space on the line without doing justice to this well-known church. "The Middlerow, Croydon" (138), by Mr. Edwin F. Parks, is a brightly-touched-in outline sketch of an ordinary street view.

The water-colour drawings now on view at the Fine Art Society's Galleries in New Bond-street, from the pencil of Mr. Charles Sainton, are, of course, exceedingly minute and clever, with all the delicacy of his silver-point studies, by which he has made a name. Lady Colin Campbell has written an introduction to the catalogue, in a very supermundane and rapturous style, about the Godhead of Beauty in the Elysian Fields, where the worship of the Eternal Feminine is many sided, "poised on the prow of her conquering galley, with the wind rustling through her outstretched wings." This sort of thing, and more about the ballet-girl's winsome face and arms "among the billowing petals of her rosy lilac skirts most charmingly relieved against pale blue," may "look like some lovely orchid," but the description is exceedingly stupid. Mr. Sainton knows how to draw a stage-dancer in the most *outré* of costumes, or a "Maiden of the Mist" with a due recognition of female charms, aided by suggestive pose and indications of the nude, while he paints with miniature grace the most attractive of models, calling his productions "Daughters of the Gods," "A Pair of Eyes," "Water Nymphs," "Outside the Café Chinois," "Flowers of the Ballet," "At the Wings," and the like. In this way his collection no doubt will attract attention, even if the "Snark-like New Woman," or "The Chanting Boojum" does not approve. This seems likely.

Those who admire "wild animals" will do well to visit Mr. Dunthorne's gallery in Vigo-street, at the sign of "The Rembrandt Head," where Mr. J. T. Nettleship has a veritable "Zoo" on view, drawn in Pastel, including lions and tigers, sleeping and fighting; leopards and Sœmmering's antelopes, bears and koodoos, the ocelot, the python, and the growingly-scarce giraffe, eagles and owls, with studies of water-fowl. The "go" and variety of these "studies from the life," as might be expected from such an experienced draughtsman, may be taken as undoubted, while the colour is often brilliant and decorative. Whether the "big game" depicted always justify this amount of colour is another question. There is always something to see of note in this charming little gallery, and few exhibits please us more than Mr. Axel H. Haig's exquisite etchings of architecture. The Conventual Church of San Juan de los Reyes, Toledo, is one of the last of his admirable productions.

I cannot say I was much impressed by the exhibition of examples now on view of the coloured photographs, or heliochromes, as Bacquerel used to term his chromo-photos produced by the Mathieu process. The first of these methods by Mathieu, about which so much fuss is now being made, consists in rendering an ordinary paper photograph transparent, and after varnishing it at the back, it is painted according to taste with body oil-colours, which show through the print in moderated intensities, according to the shading of the silver print photograph. The paint can be roughly applied provided the various outlines of the picture are maintained. The second process, though not entirely new, is more ingenious, and may be described as consisting of three gelatine films, each stained or coloured after the principle of the three primary colours, only that the red assumes a very pink or almost magenta shade. The yellow film is superposed by the blue and the red, and the various shades and blendings of the colours required in the photograph are thereby obtained. It is curious to note how the modifications result as the three negative tints cover each other. The principle differs, however, from the Lippmann's process, on which it is based. As the gelatine or film composition dries it shrinks somewhat unequally, so that in the total result the tints do not register exactly in parts, resembling in consequence a chromolithograph under similar circumstances incidental to printing. The effect no doubt will please some people; but when I was told that it would be hardly possible to distinguish between the original colouring of the "Assumption of the Virgin" in the National Gallery by Matteo de Giovanni and the little Mathieu print shown in Messrs. Lombardi's gallery with the others on view at 13, Pall-mall, I thought someone must be at fault, for I happen to know the old master fairly well, and should hardly have recognised his colouring in this otherwise clever print.

There was a Lord Mayor once who, when a petulant king threatened to remove the capital to another city in the kingdom, replied, with respectful sarcasm, that "he hoped His Majesty would leave his dutiful citizens of London the Thames." At the present moment the apparent intention of the Thames is at no late date to leave London. The condition of the river below Richmond has, at any rate since the construction of the lock at that place, become such as to call for prompt remedy in the interest of the health of the capital, and a conference of a hundred delegates, representing various authorities in the counties of London, Middlesex, and Surrey, was held on the subject last week at Hammersmith. The river is much lower now at ebb tide than it was before the use of the new lock. It is urged that the Richmond corporation should be compelled to enforce the 24th section of the Richmond Lock, &c., Act, 1890, which provides for the sluices being kept up to protect the river. This would doubtless mitigate the evil, but it is doubtful whether the section can be enforced. After much discussion as to the right means of dealing with the question, it was resolved that the conference should appoint a committee to prepare a petition calling on the Thames Conservancy to inquire into the state of the Thames below Richmond lock. Many are in favour of an additional half-tidal lock and slipway being constructed across the river at such a point as may be found practicable upon engineering advice; but if the Richmond lock is damaging Brentford and other places below it, in all probability a lock at Hammersmith would in its turn damage the places lower down. Dredging was touched upon as an alternative, but that is expensive, and not infrequently causes the banks to fall in.

The question of an Hotel de Ville is once again receiving attention from the London County Council, owing to the increasing expense of obtaining adequate accommodation for their staff. Fresh consideration has been given to the question whether it is at all possible to utilise the gigantic building between the Strand and the Victoria Embankment, raised by the Liberator Society, and which the Official Receiver proposes to open early next year as the Salisbury Hotel. The report is that there would be great difficulty in adapting the large room of the hotel for the purposes of a Council chamber, and that many of the smaller rooms would be too dark for offices, whilst the accommodation altogether would hardly suffice for the purposes of the Council. Then the cost of acquiring and adapting the building would be enormous; and, considering the position and the bad approaches, it is felt useless to examine further this particular scheme. Meanwhile, till something more suitable is forthcoming accommodation will be found in the neighbourhood of Spring-gardens for 110 more persons at an extra rental of £1,760. I believe the L.C.C. would be heartily backed up by the ratepayers were they to face the difficulty boldly and invite competitive designs for Municipal Buildings, commensurate in scale and dignity to the status of the Metropolis. Why does not some enterprising and truly Progressive member bring forward a poposition of this character?

With reference to some remarks made by Mr. Penrose on Monday night at the Institute on the appointment of District Surveyors, and some subsequent comments thereon by the *Standard*, a "District Surveyor" writes as follows to that paper:—

> "Mr. Penrose seems to forget that all district surveyors have to pass the statutory examination, which Fellows of the Royal Institute of British Architects do not, as anybody with sufficient friends among the clique forming the majority of the Council can be selected for nomination; and besides, Fellows, being restricted from acquaintance with practical work, are the very last to understand the working of the Building Act. It is odd that Mr. Penrose should suggest the selection of district surveyors from among the Fellows, when the members of the council have practically decided not to admit district surveyors as Fellows."

It does indeed seem a little inconsistent; but although district surveyors may be blackballed by the ruling powers at the R.I.B.A., there is no rule formally excluding them, although quantity surveyors are kept without the pale by special by-law. I should say that presently, when London gets a proper governing body, the whole question of the examination and appointment of District Surveyors will need reconsideration, and will probably get it, especially after the very evident disposition of the "clique" at Conduit-street to monopolise the appointments, at an early date, if possible.

A correspondent of *La Nature* announces the discovery of a buried city in Guatemala, in the neighbourhood of Santiago-Amatitlan, at the foot of Agua, a volcano of the province. At a depth of from 12ft. to 18ft. below the surface, an extensive village, which there is every reason to regard as one of the very earliest civilised period, has been excavated. The cause of its destruction is unmistakable; the ground above it is composed entirely of ashes and lava. Among the ruins have been found many cooking utensils, a quantity of richly-coloured pottery, glass vases of good design, and a collection of stone weapons. The excavators have also unearthed several very curious stone idols, near which were buried necklaces, jewels, and a quantity of pearls and turquoises. According to the opinion of local archæologists, the men who built this village, and left these memorials of the civilisation of the times in which they lived, were of the Stone Age. This view is confirmed by the appearance of the skeletons that have been discovered, nearly all of which are the remains of very tall men.

The Union Steamship Company have added another fine twin-screw steamer to their South African fleet. The *Norman*, now lying in the Southampton Water, has many special features, and as an example of naval architecture may be mentioned for the luxurious fittings and decoration of its saloons. These are lined with wainscot oak relieved by carved panels on gold grounds, and are ceiled with embossed lincrusta, producing a very rich effect, and they are lighted by a tasteful distribution of electric lights. The library and smoking-room is lined with mahogany and satin-wood carved panels, with dado and lincrusta frieze and ceiling. The two tiers of shade decks add much to the comfort and convenience of these rooms. The length of the *Norman* is 490ft., her breadth 53ft., and depth 37ft. 6in., and she has triple expansion engines. She has been constructed of steel, and designed by Messrs. Harland and Wolff, of Belfast. We believe her first voyage out is on Saturday next.

The London County Council having recently erected the asylum at Claybury for 2,000 patients, at a cost variously stated at from £500,000 to £600,000, are now taking measures to build another near Bexley for a similar number of patients, but at a cost of £300,000 (the original estimate for Claybury was under £290,000), and propose to appoint a salaried architect at £800 per annum to carry out the work. It is rumoured, however, that there may be a competition for the preparation of the plans, and that the salaried architect, when appointed, will be the assessor, and prepare the working drawings and supervise the carrying out of the plans of the successful competitor. One of the selected candidates for this post of asylum architect, while admitting that he had never been engaged upon asylum work, is said to have stated *that is my strong point*. On the other hand, one of the rejected has been actively engaged upon the "coaching" of more than one of the selected men prior to their final examination by the committee.

CHIPS.

A new organ, built by Messrs. Nicholson and Co., of Worcester, was opened in the parish church of Whitchurch, Herefordshire, on Friday.

The memory of the late Rev. F. Barham Zincke, successively curate and vicar of Wherstead-on-the-Orwell from 1841 till 1893, has been commemorated by a massive slab of black marble over the grave, and a lych-gate at the entrance to the village churchyard. The gate is of English oak, standing in a sill of Portland stone, and roofed in with Broseley tiles. Mr. John S. Corder, of Ipswich, was the architect, and Mr. Friend, of the same town, carried out the work.

Memorial stones of a new Baptist chapel were laid in Wykes-street, Silvertown, on Wednesday week. The chapel will measure 44ft. by 55ft., and will seat 350 persons. The front will be of red brick with white brick dressings, and the cost will be about £1,200.

The city surveyor of York is this week completing the repaving of High Ousegate with four different kinds of wood. A thousand blocks of each description—red deal, Tasmanian blue gum, Jarrahdale Jarrah, and Karri—are being laid in order to test the wearing powers of the several materials.

It has been decided to place in the parish church of Stoke-on-Trent a pulpit of Penkridge stone as a memorial to the late Rev. W. West. Mr. Robert Bridgman, of Lichfield, will carry out the work.

The present organ in Bristol Cathedral being unworthy of the edifice, it has been decided to appeal for £1,500, the first moiety of the sum required to replace it by an adequate instrument. The existing case will be re-used.

Building Intelligence.

Birmingham.—The markets committee, in a report to the city council, to be considered at their meeting to-day (Friday), state that the council on the 22nd May last authorised them to accept the designs of Messrs. Essex, Nicol, and Goodman for the construction of a new meat market and slaughterhouses, and to proceed with the erection of the buildings in accordance with such designs at an estimated cost (exclusive of refrigeration and pumping machinery, electric-light installation, clerk of work's salary, &c.) of £48,000. The amount sanctioned was arrived at after the original plans had undergone considerable alteration, but previous to the bills of quantities being taken out. The architects apportioned the cost as follows: Buildings, £40,000; gear and permanent fittings, £5,000; architects' commission and sundries, £3,000; total, £48,000. Tenders for the works were obtained from ten selected firms of builders, the lowest tender received being that of Mr. John Bowen. Mr. Bowen's tender being considerably in excess of the amount sanctioned for the buildings and fittings — viz., £45,000, the committee had to consider whether any further variations or modications could be made to reduce the cost, without affecting the efficiency of the buildings. Amended plans and drawings were accordingly prepared by the architects, and the same have been approved by the committee. The principal alterations in the original designs are as follows: The meat market roof is simplified in construction by making it in one span instead of two, and omitting the central girders and stanchions; the height of the side walls is reduced from 40ft. to 35ft. from floor level. The height of the basement for the cold stores is reduced to 13ft. A rearrangement of the buildings is made, by which a considerable expenditure on foundations and excavations is avoided. The tower is reduced from 145ft. to 120ft. in height. The screen walls to the streets are reduced to 20ft. in height. Some of the terracotta embellishments are omitted in the elevations, and also the glazed brickwork in the subway. With the foregoing and other minor alterations, the total cost of the work, based on Mr. Bowen's schedule of prices, will amount to £49,375, to which the committee have added £625 for contingencies, bringing up the cost of the buildings and fittings to £50,000, making, with the architects' commission and sundries, a total of £53,000. The committee recommend the council to approve of the proposed alterations, and to authorise them to have the work carried out in accordance therewith at an additional cost of £5,000.

Peterborough.—Another stage towards the completion of the new church of All Saints, Peterborough, was reached on All Saints' Day by the dedication of the second portion of the building. The cost thus far has been about £5,000, and the tower is as yet unbuilt. The foundation-stone was laid on All Saints' Day, 1886. In the first section accommodation was provided for 300 worshippers, the present extension providing for 200 other sittings. The work has been carried out by Mr. John Thompson, of Peterborough, from the plans of Mr. Temple Moore, of Hampstead, London. The style is that of the Decorated period, a special feature being its lozenge shaped pillars, which carry the arcade separating the nave from the south aisle. The exterior is of Sutton stone, with Clipsham and Bath stone dressings, and the interior work is Bath stone and brick, flat-pointed and distempered for decoration. The nave is 21ft. wide, and the south aisle 19ft., whilst the length from east to west is 104ft. The east and west windows are of Flamboyant character. The roof of the nave and chancel is covered with tiles, and the interior panelled and ribbed with deal, painted respectively blue and cream. The iron tie-rods which run across the nave are painted red. The roof to the aisle is covered with lead, and, on the interior, is panelled with deal. The floors are wooden blocks, deal in the nave and aisle, but oak in the chancel. Round the interior there is a dado with cement panels and wood framing. In the south porch is a figure of the Blessed Shepherd, which has been carved and presented by Mr. Allan, sculptor, of Lincoln-road, Peterborough, one of the sidesmen. The general carving has been wrought in the workshops of Mr. J. Thompson.

Hanover-square, W.—The council of the Royal Agricultural Society, Sir John Thorold, the president, in the chair, entertained the Duke of Westminster, Sir Walter Gilbey, and others to dinner on Tuesday night in Harewood House, Hanover-square, the new premises into possession of which the society has entered. There followed a conversazione, at which upwards of 600 guests were present. Harewood House, 13, Hanover-square, formed a portion of a much larger block purchased by the Duke of Westminster and Sir Walter Gilbey, who gave the council the option of acquiring the portion they wanted, for which —the necessary alterations included—the society have paid £30,000. The mansion was the residence of Lord Harewood, and was built by Richard Adam, one of the famous brothers after whom the Adelphi took its name. All the rooms are of handsome proportions, and are decorated in the Adam style. The whole of the extensive additions, alterations, and restoration have been carried out by Messrs. Holland and Hannen, from the plans and under the direction of the architect, Mr. Arthur Vernon.

CHIPS.

The local board of Felixstowe are in negotiation with the waterworks company of that district for the purchase of the undertaking by agreement or arbitration. They offer 25 years' purchase; but the company ask for 33 years' purchase, on the ground that the population is likely to largely increase, and that the present requirements bear but a small proportion to future receipts.

St. Martin's Church, Castleton, Lancs., was re-opened on Sunday, after renovation and internal decoration, carried out by Mr. W. H. Best, of Rochdale.

The new workhouse infirmary at Kettering was opened recently. It accommodates 63 patients, and cost, with site, about £7,000. Mr. J. Alfred Gotch, F.R.I.B.A., of Kettering, was the architect.

The new Roman Catholic Church of St. Winefride, at Holywell, was opened on Sunday. It has cost £1,500, the Rev. Father Beauclerc having been his own architect.

A destructive fire occurred on Friday at the premises of Messrs. Wylie, Stewart, and Marshall, sawmillers, Firhill-road, Glasgow, damage being done to the extent of £2,000.

Mr. Alexander Siemens, of Woolwich, has accepted the presidency of the Institution of Junior Engineers for the session 1894-5 (in succession to J. Wolfe Barry, C.B.), and will deliver his presidential address on Friday evening in next week, the 16th inst., at the Westminster Palace Hotel.

The Duke of Devonshire, as President of Owens College, Manchester, opened, on Tuesday, the new medical schools which have been added to the college buildings, from the designs of Mr. Waterhouse, R.A.

At the municipal election at Ipswich, Mr. Thomas W. Cotman, M.S.A., and Mr. Fred Bennett, builder, were returned at the head of the poll for the St. Clement's ward. Mr. Cotman, who came forward for the first time, is the only architect on the town council of the borough.

Sir D. A. Lange, F.S.A., civil engineer, of Somers-place, Hyde Park, and Hurstpierpoint, who died suddenly, on Friday, in the shop of a hairdresser in Belgrave Mansions, was appointed, in 1858, by Said Pacha, Viceroy of Egypt, constructor of the Suez Canal, and was for some years director in England of that great work, on the completion of which, in 1870, he received knighthood.

The Great Northern directors have decided to extend their branch to Nottingham from the present terminus in London Road to a point near the centre of the town, where it will effect a junction with the new railway of the Manchester, Sheffield, and Lincolnshire Company. The plans have been prepared, and early measures will be taken for securing the necessary Parliamentary assent to the scheme.

The Altofts Schools, near Wakefield, are being warmed and ventilated by means of Shorland's patent Manchester grates and stoves, the same being supplied by Messrs. E. H. Shorland and Brother, of Manchester.

At the Salford Town-hall on Wednesday, Major-General Crozier and Mr. Burd concluded a Local Government Board inquiry, which had occupied also the previous day, with reference to an application by the corporation of the borough for sanction to their borrowing £34,000 to cover expenditure incurred on public baths and bridges, a fire-station, a refuse destructor, a hospital, and a recreation-ground. Mr. Hempsall, one of the elective auditors, opposed the application, and some matters in dispute were warmly contested between him and Mr. Brown, the town clerk.

"BUILDING NEWS" DESIGNING CLUB.

SECOND LIST OF SUBJECTS.

B.—A hall fireplace in stone, with overmantel in wood, running up to the ceiling level, which is 10ft. 6in. high, and panelled. The width of the composition is to be 6ft., and the level of mantel-shelf proper is to be about 5ft., more or less, above the floor. Style, English Jacobean or Early Renaissance. Scale, inch to the foot; elevation, plans, section, and sketch.

C.—An ornamental model dairy building, suitable for erection in connection with a gentleman's estate buildings. The accommodation to comprise a dairy proper (about 400ft. superficial area), a churning-room (about 180ft. superficial area), butter pantry, and a scullery of suitable size. Fittings to be shown. A marble fountain may form a feature in centre of dairy, and an external verandah may be adopted, but not essential. Material: brick and stone, with tile roof. Scale, 6ft. to the inch: elevations, plan, section, and sketch. Style optional.

Drawings Received.—"Fronte," "Red Rose," "Ivy," "Manetho," "Triagain," "Ictinus 2nd," "Lux," "Heather," "Tamar," "Ageepee," "Esto quod es," "Pallene," "Maori," "Just My Luck," "Creon," "Nyoola," "Stabilitas," "Gryph," "Ledis," "1894," "Petrel," "Quaigh," "Lux" (Scarborough. Change your motto next time, as another competitor has adopted this one).

Correspondence.

THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

To the Editor of the Building News.

Sir,—The *Standard* calls attention to a statement by Mr. Penrose, in his opening address on Monday last, that he is by no means sure that the district surveyors appointed by the County Council will be all they ought to be, and he recommends that none but Fellows should be appointed.

Mr. Penrose is rather behind the times; but he surely must know that all candidates must pass the statutory examination, and that the County Council will not be likely to appoint men unless they have had considerable experience in building matters.

Most of the appointments or promotions made by the County Council have fallen on members of the R.I.B.A.; but why Mr. Penrose should think Fellows alone eligible puzzles me, as Associates have to pass an examination, while Fellows can slip in if they have enough friends to nominate and elect them.

The Institute promised to assist the district surveyors when the new Building Act was before a Committee of the House of Commons; but, as usual, did nothing, and a very objectionable clause for the profession was struck out, not through the R.I.B.A., but through the agent of the Duke of Bedford.—I am, &c.,

Observer.

"OLD MASTERS."

Sir,—Although so far from your side of the world, I have been a reader of your paper for many years, since long before leaving England, which interesting (to me) event occurred some fifteen years ago, and I look for my News with eagerness every week.

Now although I have no intention of suggesting to you how you should run your paper—editors get a lot of advice in that direction, I believe—I want to know why we have been treated to the reproductions of these unnatural delineations—yclept, "Old Masters"? I, for one, cannot see that there is anything to be learnt from them, and they certainly are anything but beautiful. Take the reproduction of the fresco on the wall of the Riccardi Palace Chapel for instance, which I find with the last number of the "B. N." to hand, that of August 24th, read Mr. Eastlake's scholarly description, and then gaze on the picture. Of course, I am fully aware that justice cannot be done to the colours in a photographic copy; but saw ever anyone such stiff, unnatural figures, such impossible rocks, such trees, such posing, which Mr. Eastlake considers perfectly legitimate if we suppose the procession to be coming down-hill. Note the attitude of the horses, all carefully keeping step, with one leg raised; note that some legs (particularly that of the gentleman with his head on the wrong way) cast no shadow—they are apparently transparent.

See the starfish on the ground, presumably intended for grass; note how the crowd of retainers are carefully grouped in three rows, one above the other, as if they stood upon a stepped platform. I am curious to know, too, how the horsemen in the middle distance descend from their perch into the gully immediately below them.

These are ideas which occur to me on looking at this exhibition of "masterly drawing, ingenious composition and elaborate details"—*vide* Mr. Eastlake's article. I grant the ingenious composition and elaborate details; but I quite fail to discover the masterly drawing, and, although I am fully aware that it is rank heresy to cast even the mildest criticism at an "Old Master," I am emboldened to so do, in an endeavour to ascertain whether I am alone, or if there are others who, whilst appreciating a good painting, refuse to worship any painting or work simply because it is old. I hope some one will take the cudgels for me, as it is utterly impossible to carry on a correspondence in a paper with half a world between.—I am, &c., TASMANIAN.

Launceston, Tasmania, Sept. 29th.

THE SOCIETY OF ARCHITECTS EXAMINATION.

SIR,—May I be permitted to point out an obvious error in the report (contained in your issue of last week) of my remarks on a proposal of the Society of Architects to make membership of that body conditional on passing an examination.

I could not have admitted the desirability of the Society taking this course under any conditions, since my opposition is founded on the principle of a sole examining body, as long as examinations are regarded as constituting a test of qualification to practise architecture.

As the Society of Architects professes to be a body of practising architects, this is clearly the object of their proposed examination.—I am, &c.,

W. H. SETH-SMITH.

46, Lincoln's Inn-fields, Nov. 6.

WATER CARRIAGE AND THE SEWAGE PROBLEM.

SIR,—Probably few will read that portion of your leading article of the week before last, where it deals more especially with the vaunted achievements of modern sanitary science, without first being struck with the truth of the charges it brings forward, and the overwhelming strength of the case made out against our present system; and then secondly the entire absence of any suggestion or reference towards any kind of remedy or alternative treatment. All our faith in the elaborate system which the highest engineering skill has at length accomplished, is thus dashed to the ground without so much as a hint or a word as to the direction in which we are to look for deliverance in the future. To approach so difficult a problem when the voices of light and learning hesitate, is to invite a reminder of the old proverb touching the prudence of angels and the temerity of fools, which is somewhat disconcerting in the present instance. But, Sir, are we always to be left to infer, in the face of such unquestionable facts and logic, that we must either be content to go on as we are (or rather from bad to worse, for this is what it must come to), or be classified among those who have sufficiently taken leave of their senses to advocate a return to sounder principles on a more natural basis, even though it be on more primitive lines, and at some trifling sacrifice to personal comfort?

At the risk therefore of incurring or provoking the smile of pity from the learned, or the frown from the sanitators, I would ask had it not been well to have devoted a little space to the advocacy of some principle that would not be out of keeping with modern habits and usages, but at the same time more in accordance with the first principles which lie at the root of all scientific research or advance. The argument, briefly, is that we are not justified in polluting a larger bulk for the mere convenience in conveying the lesser, and still less so when the poisoning process set up is as indefinite and as far reaching in its effects on the water as in the air. But the policy is even more mischievous or suicidal when, in a time of agricultural depression such as perhaps never before existed, we continue to defile and poison our water with the very elements nature designed to fertilise the land. To state that in nature's circle all putrescible matter must go back to the soil to become in turn the food of vegetable life is so obvious a truism as almost to require an apology for referring to it; but when this same principle is compared to modern practice and methods, one feels little or no excuse is needed for the iteration. The fact is, it appears, we have quietly made up our minds to proceed on precisely opposite lines, with the result that we may rest perfectly assured we shall be worsted in the contest, and that sooner or later nature will exact the fullest penalty for our offences in the future, as she has already done in the past. As the system of carrying sewage by water increases, so must assuredly the difficulty of obtaining pure water increase, and the virtue of the soil from which we draw our supplies diminish, all the feats of engineering skill by way of filtration, precipitation, compression, and electricity, notwithstanding. The question is therefore, Has not the time arrived for a more serious effort to prevent the solid matters from entering the sewers, and deal with them on the more rational methods represented by the dry-earth principle? Now we are so constantly in the habit of letting our habits and prejudices run away with us, that I am aware the bare mention of any modification of the dry system is to court almost universal disapproval; but may I submit, it is surely not because the earth-closets of the ordinary types are open to objections, that we are to conclude no further improvement is possible in the same direction. Neither is it because drains and sewers will always be a necessity in a large city to carry off our waste waters that we should be compelled to use them for everything, and so not only render them a greater nuisance than they need be, but a source of eminent danger into the bargain. If, however, we once succeeded in stopping the excremental matters from entering the drains, the volume of sewage to be dealt with would at once be materially diminished, and the very ingredient which is found the most troublesome to deal with in the treatment of sewage, would be got rid of, as, of course, the thinner its consistency the simpler the filtration process becomes. But it is unfortunately true, just as water is selected for its convenience as a means of conveyance the crux of the earth system lies just in the absence of this very quality, and hence the difficulty arises of distribution and collection which constitutes its chief objection. The real question then becomes, How far this difficulty can be met or overcome by an adequate system of scavenging? Such a system already exists on a limited scale for the daily removal of refuse which is not admissible to the sewers, and if this system was strengthened and properly organised little or no more difficulty would be experienced by the addition of the soil, than at present exists in the periodical removal of ashes or putrid animal and vegetable matter from our houses.

On the contrary, it would probably be found that instead of the earth being offensive, it would more often tend to neutralise the poisonous emanations from the neglected dust-holes. Even the regular distribution of earth would be found to resolve itself more into a question of supply and demand than any serious difficulty in carrying it into effect.

There would, of course, be many difficulties of a minor character relating to the application of the principle to the upper stories of houses, the construction of shafts suitable to the work of dry conveyance as well as those connected with cleaning and easy methods of access and removal; but these again would be matters more of detail than principle, which, in most cases, would only need to be presented to be overcome. They are therefore beyond the scope of my present letter, which is written more with a view of inducing the profession to take the remarks already referred to in your article seriously, and if possible make them the means of leading to some practical reform in the matters under discussion. Thus we may hope to enter on a better state of things when we shall no longer be told by the heads of the medical profession to boil and filter all our water before using it; but we shall help to complete and obey the first principles of nature's circuit, and restore to the soil that which is universally admitted truly belongs to it.—I am, &c., J. DONKIN.

The parish church of St. Swithin, at Bicker, in the Fen country, was reopened after restoration last week. A portion of the church was restored in 1876 at a cost of £1,350. The present restoration embraced the whole of the south aisle and the south transept, and has been carried out by Mr. S. Sherwin, of Boston. The work has cost £1,450.

At the last meeting of the City Corporation, Mr. Deputy Heath, chairman of the Gresham Committee, announced that the new statue of the Queen, by Mr. Hamo Thorneycroft, R.A., for the Royal Exchange, would be completed in a year. Nearly four years had elapsed since Mr. Thorneycroft received the commission, and two-thirds of the fee (2,000 guineas) had been paid.

Intercommunication.

QUESTIONS.

[11242.]—**Ventilation of Public Rooms.**—I should be obliged for information with respect to the best position for the F. A. inlets and foul extracts in the ventilating of large and public rooms. Most works clearly state that the inlets should be at a height of from 5ft. to 8ft. above the floor level, but do not fix the position for the outlets. I have recently read a pamphlet which states that the outlet should be as low as possible, and on the same side of the room as the inlet, which should be at height above named. Is this method the most efficient and satisfactory, or does it apply in special cases only, as the outlets seem to be usually placed at ceiling level?—PROSPECT.

[11243.]—**Charge for Measuring Work at Completion.**—Following up the question recently asked respecting charge made for the preparation of bills of quatities, I should like to be authoritatively informed (1) What is the recognised charge made by an architect for measuring up and preparing final account of the work, when bills of quantities have been previously supplied by him, and a charge of 2½ per cent. made for same, with expenses of lithographing and stationery in addition? (2) An architect agrees to perform the usual architect's duties, including the preparation of bills of quantities, for a remuneration of 7½ per cent. on the cost of a building. During the erection of the building alterations are made to such an extent necessitating the complete measuring-up and preparation of account for the whole of the work at completion. The proprietors disclaim any liability to pay for measuring, &c., on the ground that the terms as agreed, 7½ per cent., cover all their liabilities to the architect, and the builder is equally averse to paying, on the ground that no clause exists in the contract or bills of quantities setting forth his liability to pay charge for measuring up at completion. It is impossible for the architect to properly check the accounts if submitted by the builder without completely measuring the work. Has the architect under these circumstances a claim upon the proprietors for any extra payment for measuring the building at completion, and checking accounts, or otherwise refusing to check and pass the builder's accounts? Or what would be the proper procedure for the architect in this position of affairs? Perhaps Mr. Lovegrove or other correspondents will say. —LANCASTRIAN.

[11244.]—**Pneumatic Malting.**—Will any reader kindly give particulars of pneumatic malting, and of buildings for same? Or refer to any books or other publication upon the subject?—J. H. C.

REPLIES.

[11232.]—**Domestic Hot-Water Supply.**—"Teachable's" correction to my reply is entirely out of place, as one has no intention of including lower class plumbing in replies to this column. I would inform "Teachable," for his information, that 1in. flow and ¾in. return pipes, such as he describes in the houses "in which he is interested," are not used in *good* work, and also that in practice the flow and return pipes are generally made of equal diameter. If "Teachable" desires any further information I would refer him to a series of very valuable articles which appeared in the BUILDING NEWS some time back, which evidently he has not taken the trouble to peruse. He will there see the responsibility which depends on the two pipes in question.—R. J. ANGEL.

[11236.]—**Colouring Deed Plans.**—J. S. Stretonne is right in suggesting the use of ox-gall; but before pencilling-in the drawing, rub the skin with soft india-rubber. After inking-in, scrape some chalk on the skin, and rub with a soft cloth; then, with a little ox-gall in the colour, it will run freely. Tincture of myrrh serves the same purpose as gall, but is not so effective. To prevent ink "running" when being coloured over, scrape some alum in the colour before using same.—G. ANDERTON, Northwich.

[11237.]—**Granite, Stone and Marble.**—I know of no work on the subject sufficiently comprehensive, but suggest consulting Mr. W. Brindley, of Messrs. Farmer and Brindley, Westminster Bridge-road, S.E., who is the great authority on such matters.—H. L.

[11238.]—**Glazier's Charges.**—If I rightly understand this question, there is no question of trade custom involved. Mr. Hobbs answered one of the usual advertisements, and chose the cheapest greenhouse he could find. It is evident that he did not get what he expected, and might have found it better to have had one made for him by a local builder, or to have had a more definite contract. —H. L.

[11239.]—**Open-Timbered Roofs.**—If the roof trusses are properly constructed, the chase is unnecessary. —H. L.

[11241.]—**Ventilating Strong Room.**—"N." should make one or more apertures at the level of the floor.—H. L.

[11241.]—**Ventilating Strong-Room.**—The reason for the failure is probably to be found in the fact that all the openings are near the ceiling. Half should be arranged near the ceiling level and half near the floor level. One set will then act as inlets while the other acts as outlets, the order in which they act varying probably from day to day; but at all times a circulation of air in the apartment will be maintained.—W. H. B.

[11241.]—**Ventilating Strong-Room.**—Shorten the length of two of the four flues by fixing the outlets 2ft. or 3ft. lower than the other two. When strong-room door is shut, long flues will extract as outlets, and short supply as inlets.—WILLIAM OWEN.

The Chester-le-Street union rural sanitary authority have instructed Mr. D. Balfour, M.Inst.C.E., F.G.S., of Newcastle-on-Tyne, to prepare plans for the main sewerage and sewage disposal of Low and Middle Handon Hold, and also Thornton Fold, Urpeth, situate in the above union.

Legal.

DRAIN OR SEWER?

If this legal question were put in the form of an old conundrum, and one was asked, "When is a drain not a drain?" the proper answer would be, "When it's a sewer." The Courts are constantly having to solve these riddles, and in so doing they continually add to the number of cases already decided. The true reason for all this litigation is, of course, because, while the "owners" of property have to pay for repairs and renewals of "drains," the local authorities have to bear the expense of dealing with sewers. Unfortunately, the various Acts affecting the question were not drawn in a way that was either clear or conclusive. The latest case upon the point is that of "Pilbrow v. the Vestry of St. Leonard, Shoreditch." This involved a sum of £200 odd, which had been expended by the vestry as sanitary authority in repairing and amending some drains at Norfolk Buildings, of which the appellant was the owner. These buildings consisted of 46 sets of apartments divided into two blocks, separated by a causeway 20ft. wide. They were erected, and drains put in, in 1882 by the owner, without any plans being submitted to, and without any sanction or inspection by them. This drainage was done by means of 12 branch-drains running into a main drain under the causeway, which itself ran into a sewer within 100ft. of the blocks. The vestry had ordered the owner to amend and reconstruct these primitive drains, to provide a properly ventilated inspection-chamber, &c.; and as he would not comply, they did it at the cost of over £200, and now claimed payment.

The magistrate had held that the alleged main drain was, under the circumstances, a drain only, and not a sewer, and he made an order against the owners. Upon appeal, Justices Mathew and Charles confirmed that ruling. The Act upon which the vestry proceeded was the Metropolis Local Management Act, 1855, s. 250 of which provided that a "drain" shall mean and include any drain of, and used for, the drainage of one building only, or premises within the same curtilage, and made merely for the purpose of communicating with a cesspool or other receptacle for drainage of two or more buildings. It appeared that, in the causeway dividing the two blocks of buildings there was the common dustbin; and on this and the other facts the Court held that these buildings were within the same curtilage, and so that the case clearly came under the definition quoted, and that this drain was a drain for which the owner was responsible, and not a sewer.

Fred. Wetherfield, Solicitor.
1, Gresham Buildings, Guildhall, E.C.

Note.—All questions for reply in this column must be headed "Building News," and must reach my offices, as above, by *Tuesday* morning to insure answer same week.

Balham.—Ancient Lights.—Abandonment.—As you have in fact given up the old lights, and in rebuilding put lights in different places, this amounts in law to an abandonment. And as the new lights were only some four years old, you have not acquired any right to claim by prescription, and so there seems to be no case.

L. P.—Lease.—Drains.—Liability.—Under the covenant quoted I do not consider that the lessee could be made liable for the new drains now required by the sanitary authorities. The lessee should refer them to the lessor as owner. He will have to do the work, and he will then only raise the question by suing the lessee upon his covenant for the amount he has had to expend.

Lancastrian.—House.—Cesspool.—Sewer.—I do not know how the owner of one house, although adjoining a highway, can make the local authorities build a sewer for his drainage. But it would be as well to send in a complaint to the Local Government Board as to the neglect of the cesspool now used, and see what can be done in that way.

◆

At St. Luke's Parish Church, Leek, on Tuesday week, special gifts of oaken furniture, valued at £1,375, were dedicated. They included tabernacle and figure work, new fronts to organ and stalls, in addition to a new vestry and organ chamber.

The Council of the Senate of Cambridge University recommend the acceptance of the bequest of the late Mr. Samuel Sandars, M.A., of Trinity College, who left the sum of £2,000, free of legacy duty, to the University, for the endowment of a Reader in Bibliography. The lectures are to embrace the subjects of bibliography, palæography, typography, bookbinding, book illustration, the science of books and manuscripts, and the arts relating thereto.

LEGAL INTELLIGENCE.

Drain or Sewer.—Pilbrow v. the Vestry of the Parish of St. Leonard, Shoreditch.—In the Queen's Bench Division on Friday, Mr. Justice Mathew and Mr. Justice Charles heard an appeal by way of special case from the decision of Mr. Rose, Metropolitan Police Magistrate, who had directed the appellant, Mr. John Smith Pilbrow, to pay £209 7s. 6d., the amount expended by the vestry, as sanitary authority for the parish, in cleansing, altering, and amending drains at Norfolk-buildings. The appellant was in receipt of the rents and profits of Norfolk-buildings, which consisted of 46 sets of apartments. These apartments were divided into two blocks, separated by a causeway 20ft. wide. The buildings were erected and the drains put in by the owner, in 1882, without any plans having been submitted to the local authority, or any inspection or sanction of the drains by them. The drainage was by means of 12 branch drains running north and south from each set of apartments, into a main drain running east and west under the causeway, with a sewer within 100ft. of the blocks. In November, 1892, the inspector of nuisances gave the appellant notice to amend and reconstruct the main drains, but as he did not comply with them the vestry executed the work, at a cost of £209 7s. 6d. The appellant contended that he was not liable to pay the expenses incurred by the vestry, because the alleged main drain was used "for the drainage of more than one building, and not for draining any block of houses by a combined operation under the order of any vestry or district board," and was, therefore, not a drain, but a sewer within the meaning of the interpretation clause of the Metropolis Local Management Act, 1855. The magistrate decided that the alleged main drain in question, draining blocks of houses by a combined operation, was, under the circumstances, and notwithstanding the absence of any order of the vestry, a drain, and not a sewer within the meaning of the act. At the conclusion of the arguments, Mr. Justice Mathew said the magistrate was right in holding that the drain in question was not a sewer within the meaning of the statute. The causeway was within the curtilage of both buildings, and therefore the appellant was liable to execute the works. The appeal would be dismissed with costs. Mr. Justice Charles concurred.

Dispute in the Plastering Trade.—Wright v. Hennessey.—In the Queen's Bench Division, on Friday, before Mr. Justice Wright and Mr. Justice Collins, an application was made in this case, "Wright v. Hennessey," for an injunction. The plaintiff is a plaster manufacturer in London, and the defendant is the secretary of the National Union of Operative Plasterers. The plaintiff has instituted an action against the defendant for damages for inducing his workmen to leave their work in violation of their contract of service, and he now asked for an injunction restraining the defendant from inducing a building firm to break a contract with the plaintiff, and from inducing persons not to employ or make contracts with the plaintiff. The defendant, in an affidavit, alleged that the plaintiff had organised an association in antagonism to that of which he is secretary, and stated that in writing the letters complained of he was simply carrying out the instructions of his own society. After argument, counsel for the defendant gave an undertaking that, until the trial of the action, his client would refrain from attempting to induce persons who had entered or who might hereafter enter into contracts with the plaintiff to break them; and on this undertaking their lordships made no order on the application.

Alleged Imperfect Drainage by a Contractor and Vestryman.—Mr. W. J. Winsford, a member of the St. Saviour's board of works, a member of the sanitary committee, and a contractor, carrying on business at 4, Charlotte-street, Southwark, appeared at Southwark Police-court on Wednesday to a summons charging him with "having constructed a drain at 75, Blackfriars-road, Southwark, so as to be a nuisance and a danger to health." In August the St. Saviour's board of works discovered that the drainage of No. 75, Blackfriars-road was very defective, and they ordered certain sanitary work to be carried out. The defendant sent in an estimate for the work for £49, which was accepted. The defendant executed the work, which was passed by one of the board's officials, who has been called upon to resign for the alleged part he took in the transaction. The ground floor of the house was reopened by order of the board, when it was discovered that the pipes were laid on shingle or ballast instead of cement, and that the joints were so defective as to allow the sewage to leak through into the soil. To test the matter, one end of the drain was blocked, and out of 100 pails of water poured into it 99 leaked out of the joints. Mr. Dodd, for the prosecution, said the defendant could not plead ignorance, as he knew well what the requirements of the board were, and he was actually a member of the very committee which ordered the work to be carried out. Dr. Herron said the work was so badly done that it was dangerous to health. After a protracted hearing, Mr. Fenwick decided to adjourn the case.

◆

WATER SUPPLY AND SANITARY MATTERS.

Durham and its Sewage.—The Durham County Council has issued a writ upon the corporation of Durham, in connection with the alleged pollution of the Wear by the discharge into it of the sewage of the city. Several months ago the county council gave notice that they would require the city to take the sewage from the river, and the corporation has at present under consideration a scheme by Mr. Fowler, C.E., to effect the desired end by establishing a sewage farm, and diverting the drains into it instead of the river. A meeting of the corporation was held on Monday, when it was decided to defend the writ, which is returnable at the next Durham County Court.

Fowey Water Supply.—At St. Austell rural sanitary authority's meeting, the clerk reported that Mr. Bellamy, surveyor of Plymouth, had written declining to accept £100 in settlement of his account (£147) for preparing plans, &c., for the Fowey Water Works, which the board had declined to adopt, and had terminated their engagement with Mr. Bellamy. The plans of Mr. G. Andrew, of Liskeard, for the Fowey water scheme, were submitted and approved, and estimates for carrying out the work were ordered to be obtained.

◆

CHIPS.

The records of the Carpenters' Company of Coventry, recently purchased by the council of that city from Mr. William Webb, of Coventry, whose father was the late master, are of considerable interest. There are three volumes, dating from the middle of the 15th century. The first, which is somewhat dilapidated, contains the accounts and transactions of the company, but the entries in the two later volumes are confined principally to accounts. The earlier entries are much obliterated and almost undecipherable.

The free public library at Colchester, built at a cost of £4,000, from designs by Mr. Brightwen Binyon, of Ipswich, was inaugurated last week.

The board of guardians for Newton Abbot, Devon, last week adopted plans for rebuilding the workhouse, at an estimated cost of £5,000.

After much correspondence between the Taunton town council, the engineer, and the Local Government Board, the new highway bridge over the river Tone in that borough has been successfully lowered to its new level, one foot lower than as first fixed, by the contractor, Mr. H. W. Pollard. The weight of the bridge was about 250 tons.

A new board school has just been commenced in Broughton-road, Edinburgh, and will cost £24,000. Accommodation is provided for 854 boys and girls and 512 infants, and the style adopted is Renaissance. Mr. R. Wilson, of Edinburgh, is the architect, and Mr. William Gerard, of the same city, the contractor.

A Local Government Board inquiry was held on Tuesday at the Public Offices, Green-lane, by Mr. W. J. Bird Clerke, M.Inst.C.E., to consider the application of the West Derby Local Board for sanction to borrow £5,300 for works of private street improvement, and £600 for works of sewerage.

Alterations are being made at the workhouse, Driffield, East Yorkshire. New vagrant wards are being erected in accordance with the most recent recommendations of the Local Government Board. The separate-cell system is being adopted, and, in addition, there is an association ward to accommodate 20. Receiving lobby, bathroom, clothes-drying, and disinfecting rooms are provided, as well as a commodious stone-breaking yard and sheds. Boyle's system of ventilation has been adopted, and Messrs. King and Co., of Hull, are executing the heating. The complete outlay will be about £1,000. The whole of the works are being carried out by Mr. M. Gage, of Driffield, under the superintendence of Mr. Joseph Shepherdson, architect.

Lady Northcote cut at Exeter, on Wednesday, the first sod of the new railway, which it is proposed to construct between Exeter and Chagford. The line will open up a portion of Devonshire now accessible only by coaching. It will go through the upper portions of the valley of the Teign—a district abounding in delightful moorland and rural scenery. The line will be about 26 miles in length, and, with one exception, that of a considerable tunnel, presents no engineering difficulties. It will branch off from the Great Western main line at Exeter, and be carried on as far as Teign House, where it will join a branch line from Newton Abbot and continue through the Teign Valley to Chagford. One part of the project is the purchase of the existing Teign Valley line, and this will give an alternative route between Exeter and South Devon. The estimated cost is £240,000, or about £14,000 per mile.

Our Office Table.

The annual exhibition of the Art Society at Sydney, New South Wales, affords unquestionable evidence of local progress in the domain of picture-painting equal to that made during any previous years. On the whole, it is decidedly the best exhibition of the work of Australian artists ever held in Sydney. The average standard is higher than that of any previous exhibition, and whilst some of the best-known artists have on previous occasions exhibited works of more importance than any by which they are represented in the present instance, with one or two exceptions, it could hardly be said that they have this year failed to maintain their reputation; and others, again, are even showing better work than they have shown before. The most conspicuously meritorious feature of the present exhibition, however, is the evidence afforded on all sides of the progress of the younger artists, and especially of some who, a couple of years ago, were known only as struggling art-students. Never before have so many new names been brought so worthily into prominence. Never before have beginners been quite so venturesome and so successful.

At the last meeting of the City Court of Common Council Mr. Deputy Edmeston, F.R.I.B.A., moved that the City Lands Committee should consider what steps should be taken to remove the present unsightly structure which disfigured a large part of the front of the Guildhall. The deputy pointed out that the present architectural features at the entrance to the Guildhall were at variance one with the other, and declared that the only way of making the styles of architecture identical was to remove the portion he referred to and restore it with a form of architecture in keeping with the style adopted in the building of the original portion of the Guildhall. Mr. A. A. Wood asserted that the porch was certainly one of the most ancient parts of the Guildhall. Major Joseph believed that the motion did not go half far enough, as it would be necessary for the display of the original part of the Guildhall to pull down the City Solicitor's and Remembrancer's offices, and even the Art Gallery. He would prefer that the sum of £50,000 should be voted for the purpose. Mr. H. H. Bridgman, F.R.I.B.A., thought a complete scheme should be drawn up by the committee. The motion was adopted.

The City of Liverpool School of Architecture and Applied Arts opened on Monday, the staff consisting of Professor F. M. Simpson, formerly Royal Academy Travelling Student; Mr. Charles J. Allen, silver medallist, Royal Academy; and Mr. R. Anning Bell, silver medallist, Royal Academy. Professor Simpson instructs in architecture, Mr. Allen in sculpture, and Mr. Bell in painting, and each is assisted by practical craftsmen. The aims of the school at its outset thus described are:—"1. To effect a complete union between the different arts and crafts. 2. To establish a thorough course of training for students in the different arts, especially in architecture, sculpture, and decorative painting. 3. To provide special instruction of an advanced kind for skilled craftsmen and artisans, chiefly in those crafts allied to architecture."

After the great earthquake shocks in Greece last spring, a grand committee was appointed to make an investigation of the Parthenon, in order to ascertain what damage the temple had sustained. On careful investigation, the committee reported that the edifice had been seriously injured, and that there was great risk in allowing it to remain in its present dangerous condition. They recommended, therefore, that immediate steps be taken to strengthen the building. It is satisfactory to be able to add that the Archæological Society, at a meeting called to consider the question, have voted an unlimited credit for the purpose of effecting the necessary repairs; but the question of who will superintend the work is one of the highest interest and importance.

Concrete has been successfully used in tunnel lining. A recent paper read before the American Society of Civil Engineers by Mr. Desmond Fitzgerald, M.Am.C.E., describes the lining of a waterworks tunnel with concrete—viz., the Sudbury River Aqueduct—which supplies Boston with water. A track was constructed for cars for transferring the concrete to the linings and for moving the centres; but this was elevated so as to allow the water to run underneath during the operations. Special track and cars were constructed, and are described. The "centres" for the concrete lining were of great strength, as no bracing could be used. These were spaced at 4ft. centres, and were built of three thicknesses of spruce planks, 10in. deep, breaking joint to the curve of tunnel, and were put in in three sections. Upon this Portland cement concrete lining was formed, and the irregular cavity between this lining and the rock was filled with American cement concrete. The concrete lining was about the same thickness as the centres 10in. to 12in., and we believe the work has been a success.

A correspondent of *Indian Engineering* observes that tar is most efficient when applied to fir, beech, pine, and poplar. Chloride of zinc is only reliable for birch, while sulphate of copper is most suitable for oak. As a matter of fact, the efficacy of any process for preserving timber depends on its dryness or seasoning, whether kiln-dried or otherwise, and the manner in which the salts are applied. The relative efficiency of the methods will be found to depend on the natural powers of durability of the wood in their untreated state. Until all the conditions necessary for injecting creosote or other liquid solution are known, it seems arbitrary to say that one wood is preserved better by tar than by any other process.

MEETINGS FOR THE ENSUING WEEK.

Monday.—Surveyor's Institution. Opening Address by the President. T. Chatfeild Clarke. 8 p.m.

Tuesday.—Institution of Civil Engineers. Opening Address by Sir R. Rawlinson, K.C.B., President. 8 p.m.

Wednesday.—Carpenters' Hall. Lecture to students on "Sanitation," by Henry Law, M.I.C.E., 8 p.m.

Friday.—Institution of Junior Engineers. Inaugura Address by Alexander Siemens, President

The Society of Architects.

Founded 1884. Incorporated 1893.

The FIRST ORDINARY MEETING of THE SOCIETY OF ARCHITECTS for the SESSION 1894-5, will be held at St. James' Hall, Piccadilly, W., on TUESDAY, November 13th, at Eight o'clock p.m., when the PRESIDENTIAL ADDRESS will be delivered by Mr. EDWIN J. HAMILTON.

ELLIS MARSLAND, Hon. Sec.
A. MONTEFIORE, Secretary.

CHIPS.

A receiving order has been made in the case of Alfred Carden, of Brighton, architect and surveyor.

A new police-station is being erected in West Ham-lane, Stratford, and special consideration has been given to the ventilation, which will be carried out on the Boyle system, the latest patented improved form of self-acting air-pump ventilators being adopted for the extraction of the vitiated air.

The Bishop of London reopened All Saints Church, Buxton-street, Mile-end, last (Thursday) evening. The church was condemned as dangerous by the London County Council. The stonework has now been removed and a new tower built. The cost of the restoration has been £1,500.

The new free library at the corner of Southwark Bridge-road and Unwin-street, S.E., was opened on Friday by Mr. R. K. Causton, M.P. The building has been erected at a cost of £5,500, exclusive of site, from plans by Mr. J. Johnson, of Queen Victoria-street, E.C.

The foundation-stones were laid at Rhyl, on Friday, of a new chapel for the Zoar Welsh Wesleyans. The old chapel has been in existence for 25 years, and is situated in Sisson-street. The site of the new chapel is in the same street, but on the opposite side. The building is of brick, the front being faced with Ruabon pressed bricks and stone dressings. It will seat about 250 people. Mr. W. Lloyd Jones, Bangor, is the architect, and Mr. Hugh Jones, Rhyl, the contractor, the amount of the contract being £1,604.

The parish church of Whittington, Salop, was reopened, after restoration, on Tuesday week. The works have been carried out under the direction and from the plans of Mr. Corrie Frere, of London. Mr. W. H. Thomas, of Oswestry, was the contractor, and Mr. A. Sanderson the clerk of works. The walls have been panelled in sequoia wood, and a chancel arch of the same material erected. The masonry has been renewed, where necessary, in Shelvock stone, and the roof partially retiled. The windows are fitted with new glass, and the stained-glass memorial windows have been reset, the terra-cotta work being supplied by Mr. J. C. Edwards, of Ruabon, and the glazing by Messrs. Shrigley and Hunt, of Lancaster. A new pulpit of Kaurie wood has been erected as a memorial.

Trade News.

WAGES MOVEMENTS.

Dispute and Strike at Messrs Trollope's.—The dispute which has arisen in the London building trade between the Master Builders' Association and the London Building Trades Federation has already resulted in 300 men employed by Messrs. G. Trollope and Sons leaving their work. At the conclusion of the great strike in 1892, it was mutually agreed, the masters contend, that the unionists should work with non-unionists, and that the employers should make no distinction between the two classes of workmen. The masters allege that, while they have kept to their part of the agreement, the unionists have again and again refused to work with non-unionists, and they have therefore, through the London Master Builders' Association, given the Federation notice of their intention to terminate the 1892 agreement on May 1st next year, thus giving the six months' notice which was stipulated in the agreement. This action on the part of the employers has caused a considerable amount of irritation amongst the members of the various unions connected with the building trade, and when on Wednesday week Messrs. Trollope and Sons, builders, of Grosvenor-road, S.W., engaged some men who were non-unionists for one of their jobs, the unionist carpenters, bricklayers, and plasterers at once left the building. Before the day was out the unionists at work on jobs in Duke-street, Mount-street, Park-lane, and Portman-square had also struck. On Friday there was an extension of the strike, and other jobs of the firm in Cadogan-square, Belgrave-square, and at Stafford House were struck against. In all, nearly 300 of the unionist workmen of the firm have struck.

The Dr. Macfadyen Memorial Congregational church at Chorlton-cum-Hardy was opened last week. The church has been built and furnished at a cost of £5,200; it has been built by Mr. H. Matthews, Manchester, from designs by Mr. F. W. Simon, Edinburgh. The style adopted is Late Gothic. It is seated for 650 persons. The pulpit, choir, and organ are placed in an octagonal-ended apse, and the same form is used for the transepts. Externally the walls are of pressed bricks with Runcorn-stone dressings. One angle of the main façade is emphasised by an octagonal turret, the spire of which is covered with red tiles, which are also used for the roof.

The North British Railway Company, who are rebuilding the Waverley Station in Edinburgh, have adopted plans by Messrs. Cunningham, Blyth, and Westland, of that city, for rebuilding the Waverley Bridge leading to the station. The new bridge will differ only in its length and in strength from the present one. It will have the same levels, and it will occupy the same position and be of the same design. Within a very short time indeed the contracts will be signed and the operations will be entered upon. From considerations of traffic the bridge will be constructed in two sections.

Lord Burton handed over to the corporation of Burton-on-Trent, on Tuesday, a town hall. Fourteen years ago the late Mr. M. T. Bass built an institute in the parish of St. Paul at a cost of £46,000. One portion he set aside for Church purposes, another was devoted to the local Liberal club, and a large hall was at the disposal of the promoters of public gatherings. The buildings were occupied by the respective authorities on a 15 years' lease, and Lord Burton has now converted them into a town hall. To accommodate the Church people and the political party, he erected new buildings at an expenditure of £21,000, while the work of rendering the older edifice suitable for municipal purposes has involved the donor in a further expenditure of £17,000. Included in this latter scheme is a new council chamber. The value of the gift is £64,000.

MAHOGANY, WAINSCOT, WALNUT, TEAK, VENEER, and FANCYWOOD MERCHANTS,
120, BUNHILL ROW, LONDON, E.C.
The most extensive Stock of every kind of Wood in Planks and Boards, dry and fit for immediate use.

TENDERS.

*** Correspondents would in all cases oblige by giving the addresses of the parties tendering—at any rate, of the accepted tender; it adds to the value of the information.

ACTON, W.—For the erection of a temporary iron building, foundations, drains, &c., at the Osborne-road Board School, for the Acton School Board. Mr. Edward Monson, F.R.I.B.A., Acton Vale, W., architect :—

For iron buildings, &c. :—			
Humphries, Ltd., Knightsbridge ...	£246	0	0
For foundations, &c. :—			
Arnold, E., New Cross	62	5	0

BIRMINGHAM.—For the construction of the new meat market and slaughterhouses for the corporation. Messrs. Essel, Nicol, and Goodmans, of Birmingham, architects :

Bowen, J. (recommended for acceptance) ... £49,375

(Revised tender to reduced plans, Mr. Bowen's having been the lowest sent in of ten selected firms).

BOURNE, LINCOLNSHIRE.—For providing a galvanised-iron cistern to hold 250 gallons, at the workhouse :—

Clarke, F. J., Bourne (accepted).

CARDIFF.—For works of private improvement, for the town council :—

For Hinton, Marion, and Millman streets, and Moorland-road—

Rich (accepted) £1,328 17 11

For Milford, Swansea, Adeline, Fishguard, Pontypridd, Neath, and Tenby streets, and Portmanmoor-road—

Ellis and Davies (accepted)... ... £4,237 4 11

CANNOCK, STAFFS.—For enlarging the board-room, clerk's office, &c., at the workhouse, for the board of guardians. Messrs. J. R. Veall and Son, Wolverhampton, architects :—

Gough, H., Wolverhampton ...	£328	10	0
Whittome, A., Stafford	307	0	0
Kent, J., Cannock	306	0	0
Guest. J., and Son, Stourbridge ...	305	0	0
Williams, A., Wyrley	298	15	0
Anderson, M. B., Cannock	295	0	0
Reynolds, J., Cannock (accepted)...	280	0	0

CHATTERIS, CAMBS.—For the rebuilding of the rag factory :—

Fletcher, D. (accepted).

CHELSEA, S.W.—For the erection of a doctor's house and nurses' quarters at the infirmary, Cale-street, Chelsea. Messrs. Lansdell and Harrison, 12, Compton-terrace, Highbury, N., architects. Quantities by Messrs. Northcroft, Son, and Neighbour, 57, Charing-cross, S.W. :

		A.
Britton, F.	£10,444	£80
Smith, J. J....	10,300	50
Battley, Sons, and Holness ...	10,347	100
Calnan and Co.	10,148	—
Prestige and Co.	9,970	30
Craske, O., and Co.	9,850	50
Higgs, F. and H. F.	9,875	225
White, F., and Son	9,720	80
Minter, F.	9,670	45
Wave, G.	9,700	120
Norton, W.	9,588	50
Jerrard, S. J., and Co.	9,569	40
Holloway, H. L.	9,643	120
Wallis, A.	9,587	80
Dupont, F.	9,587	150
Lorden, W. H., & Son, Trinity-road, Tooting (accepted) ...	9,469	150

A.—Credit for old materials.

CLERKENWELL, N.—For the erection of a store for books and apparatus in conjunction with a store for furniture, on land adjoining the Bowling Green-lane site, Clerkenwell, for the London School Board :—

Yerbury, R. A., and Sons	£38,320	0	0
Reed, A., and Son	36,426	0	0
Shillitoe, J., and Son	35,000	0	0
Grover, J., and Son	34,753	0	0
Downs, W.	34,570	0	0
Collinson, J. F.	34,510	0	0
Boyce, T.	34,180	0	0
Stimpson and Co.	33,950	0	0
Lawrance, E., and Sons	33,350	0	0
Foster and Dicksee	32,950	0	0
Kirk & Randall, Woolwich* ...	31,324	0	0

* Accepted.

COVENTRY.—For the erection of new board schools at Red-lane :—

Golby, T. G.	£5,113	0	0
Smith, G. F., & Sons, Milverton ...	5,089	0	0
Parnell, J., and Son, Rugby ...	4,984	0	0
Bowen, J., Balsall Heath	4,888	0	0
Hill, C. G.	4,842	0	0
Haywood, C.	4,795	0	0
Isaac, J., Foleshill	4,696	0	0
Liggins and Strong	4,672	0	0
Wincott, A. A.	4,600	0	0
Kelly and Son, Foleshill	4,500	0	0
Worwood, J.	4,218	0	0
Garlick, C. (accepted)	4,180	0	0

DARTMOUTH.—For pulling down and rebuilding the George and Dragon inn, Dartmouth, for Mr. J. Bartlett. Messrs. E. Appleton and Son, F.R.I.B.A., M.Inst.C.E., Torquay, architects. Quantities by Mr. C.S. Appleton :—

Smerdon, J., Torquay	£1,178	0	0
Hawkins, S., Chelston	1,012	0	0
Yeo, R. F., Torquay	960	0	0
Pillar, R. T., Dartmouth	950	0	0
Goss, Bros., Torquay...	898	0	0
Rabbich and Brown, Paignton ...	784	0	0
Pike and Voisey, Dartmouth* ...	780	0	0

* Accepted. Architect's estimate, £800.

DURHAM.—For additions to Aden Cottage, Durham. Mr. H. T. Gradon, Durham, architect :—

Kell, J.	£1,780	0	0
Shepherd, J.	1,725	0	0
Ainsley, T.	1,652	0	0
Gradon, G., and Son	1,566	17	0
Gibson, C. W.	1,564	1	2
Bradley, G.	1,552	3	0
Wardropper, W. (accepted) ...	1,550	0	0
Whaley, J. (withdrawn)	1,490	0	0

All of Durham.

KENILWORTH.—For providing a steam-pump and boiler at the new bore-hole :—

Hatton, of Coventry (accepted).

LEEDS.—For the erection of a retail fish market for the city council :—

Cross and Carter (accepted) ... £2,858 0 0

LONDON.—For the erection of flats and warehouse at Mercer-street, Long Acre, W.C., for Messrs. Pankhurst and Co., Ltd. Messrs. Kidner and Berry, 23, Old Broad-street, London, E.C., architects :—

Scott, S. J.	£7,639	0	0
Foster and Dicksee	7,278	0	0
Colls and Sons	7,248	0	0
Grover and Sons	7,085	0	0
Munday and Sons	7,050	0	0
Gough and Co....	6,874	0	0
Scrivener and Co.	6,723	0	0
Killby and Gayford (accepted) ...	6,636	0	0

AND ENGINEERING JOURNAL.
VOL. LXVII.—No. 2080.

FRIDAY, NOVEMBER 16, 1894.

DELEGATION OF DESIGN.

THE present age is beyond any previous distinguished for the separation that has taken place between organisers and workers. In every department of human labour and industry we find this marked division existing. The City business man in every vocation finds it to his advantage to give up his attention to customers and clients, instead of dividing his time between them and the actual work of his office. The architectural and engineering firms find it better to delegate the duties of draughtsmanship and of office labour to a younger partner, or to a staff of managers and clerks, so that their hands may be free for outdoor work, and the more lucrative task of finding clients and negotiating with them. The manufacturing firms in the same way know the importance of separating the official and administrative from the working part of their businesses. Some firms only receive orders, and hand over their execution to outsiders. That commercial transactions have been facilitated by this division or delegation of duties is beyond question; indeed, in the present complex condition of trade, it would be impossible to conduct business on the old system. Competition, too, calls for men who are specially skilled in eliciting orders and in organising business. "Touting" is as necessary a factor in all trades as skilled workmanship. The professions have also been obliged to adopt the same division. Lawyers, doctors, and architects have each found it desirable to separate the business from the working department. The visible representative is generally a glib, if not voluble, individual; he is the "show" member of the firm, both in dress and in manner. Of the other members of the staff little or nothing is known—they may be "ghosts" for aught anybody can tell; they are seldom seen, and remain in the background. Whether as lawyer's clerk, medical dispenser, or architect's assistant, he receives his instructions direct, without any confusing issues, and he is quite exempt from all disturbing influences.

There are two kinds of delegation—that in which the employers or principals' ideas are committed to others to carry out, as when an architect gives a rough sketch of his design to his draughtsman or artist; and that in which he deputes another to prepare a design quite independently, as when an architect puts the work into the hands of an outsider. These two methods stand on quite different grounds. In the first case, the design is really committed to another to work out—the merit or demerit of the work belongs to the principal who takes the responsibility of the design; while, in the second case, the design is entirely the work of another, who becomes a substitute for the architect, and remains in the background. Architects, as a matter of necessity, are obliged to distribute their work amongst their own staff, and our leading men follow the same rule. After the rough sketch-plan and elevation have been made, the draughtsman prepares the contract drawings under the eye of the principal, who is really the designer; or if an outside draughtsman is engaged, the same supervision and alteration can be exercised when the drawing is completed, in pencil. There can be no possible objection to such a delegation of the mechanical part of the work. No man can do all the work himself, and it is no more reasonable to think that an architect should execute his own designs on paper than it is to expect a builder to undertake all the trades with his own hands. Many, indeed, tell us that an architect ought to be able to frame timber, to be able to lay bricks, to carve stone, and to undertake the decorator's work. No doubt he would be all the more skilful if he could do all or some of these things; but the fact is that he could not do them if he wished. It would be a physical impossibility, and would be worse for his client if he did, because such labour would distract his attention, and take his mind off more important matters.

Division of labour, we say, is necessary up to this point; but when it goes to the extent of employing a substitute to do the engineer's work, or the artist's work in the design of a building, then it exceeds its proper limit, and encourages the practice of designing by deputy, of handing over his work to a substitute, yet getting the credit —or, in other words, "sucking another man's brains." There is plenty of this wholesale delegation, and, unfortunately, it promotes the "ghost" system, which has been so justly condemned by all conscientious men. Many of our great buildings have been the work of ghosts, and, as we have heard of late, two at least of the recent competition designs for municipal buildings in London that have been successful are due to invisible hands—to men who are content to be paid a honorarium for their services by those who take all the credit. In nearly every large contest of late years the delegation of this important function has been plainly evident in the marks of draughtsmanship and style. Yet no one cares to interfere. The committees who invite as business men would refuse to be bound by any such declaration as that proposed the other day, not to accept any design whose author could not swear it was his own *bonâ fide* work. Such an interference with the rights of competitors would be repudiated by the employer on the same ground as he would decline to interfere with a manufacturer or contractor who let out his work. It would militate against the freedom of the competitor, and its effect would be to reduce the number of competitors. No doubt a condition of this sort might be desirable in the interests of the profession, by making the competitor responsible for his own design, and in discouraging the practice we are referring to; but the measure would be coercive, and could be overcome by subterfuge. No; the real reform must come from the profession itself, from a higher sense of the functions of the true architect, and from the feeling of degradation which the practice ought to evoke in the mind of every competent member. Men who can resort to the manœuvre to win their spurs must convict themselves of dishonesty and bring disrepute on their profession. Those men who employ others to make their designs for them are sometimes skilful organisers of business, and even clever in planning and construction; they are often men who would make capital active partners in a firm; but when they begin to misrepresent themselves as architects by using the brains of outsiders, they seriously compromise their art. Will examinations and professional tests remove this reproach? If we could, by examination, test the person's qualification as a designer, the difficulty would be solved; but we are afraid this qualifying test will, by affording a minimum passport to practice, encourage delegation of that function which is necessarily excluded from the syllabus. Is there not the risk that the real artist will remain outside, or that a more mischievous hiatus will be created between construction and design? The profession will do well to reconsider this point in the formulation of any examination ordeal in the future. They will have to consider the best means of ascertaining the capabilities of the candidate in design and draughtsmanship, and of checking the delegation of duties which rightly belong to the architect. Every candidate for the profession should be able to produce undoubted proofs of his ability by submitting sketch designs, as well as being able to declare that the drawings he puts in are the work of his own hands. The direct transference of thought to paper is the only test that can be of value.

Vicarious art is seen in many other branches besides that of the architectural designer. To the engineer is committed the details and specification of iron construction, and to him the design is largely delegated, as when he has to construct a large iron roof like that of St. Pancras' Station, or the Olympia. To the metal-worker the architect leaves often the design of grilles, candelabra, and other details; to the church furnisher the patterns of fittings; to the glass-painter designs for windows, and so on. In Secular work the manufacturer and the ornamentist, or decorator, relieves the architect's hands of a good deal of work. On the principle of division of labour the public have to some degree benefited. It would be easy to show the advantages of limiting one's thought and labour to a particular function or duty. On the other hand, it is necessary to insist that the architect ought to be prepared to hold his own; that if he delegates a certain duty to someone else, he should have a supreme control in the design, and that on no account ought he to hand over portions of his work to substitutes who cannot know the actual requirements or enter into the spirit of his design. According to the practice of many architects, the design of a building may be distributed on commercial principles, like the process of a manufacture of pins or needles. One man does the plan, another the elevations, a third writes the specification and quantities, and so on. The execution is also let out to the sanitary engineer, the carver, the decorator, the plasterer, and modeller. But how purposeless is the result! We enter many of our City offices, commercial buildings, and dwellings. No one single mind is prominent; a dozen or more tradesmen have advertised their goods or themselves, and each has had his own way. But it might and would have been different if the old co-operative spirit had existed. The fault that is obvious to the beholder is that each has been deputed a duty at the lowest possible price; that each of the artists employed has been engaged by another to do the work for him, to do something which the architect could not do, and to do it that he might take the credit. It is this substituted, vicarious art that has done so much harm to real architecture. Everything is deputed to someone else who will do it *incognito*, and at the least cost. From the façade of the building down to the door-handles the design has been delegated to competitive skill, and to men that are willing to sell their abilities in the cheapest market. As we said at the beginning, it is the organiser that now stands too often in the front ranks of his profession, and the ability to know where the best and cheapest workers are to be met with is no mean qualification. And this condition of affairs will remain under the present constituted state of the profession.

MONSTROSITIES.
